SELECTED WATER RESOURCES ABSTRACTS

VOLUME 4, NUMBER 7
APRIL 1, 1971

THE LIBRARY OF THE
APR 29 1971
UNIVERSITY OF ILLINOIS
AT URBANA-CHAMPAIGN

W71-03301 -- W71-03850

SELECTED WATER RESOURCES ABSTRACTS is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the National Technical Information Service (NTIS), U.S. Department of Commerce. NTIS was established September 2, 1970, as a new primary operating unit under the Assistant Secretary of Commerce for Science and Technology to improve public access to the many products and services of the Department. Information services for Federal scientific and technical report literature previously provided by the Clearinghouse for Federal Scientific and Technical Information will now be provided by NTIS.

SELECTED WATER RESOURCES ABSTRACTS is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U.S. Department of the Interior, Washington, D. C. 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from the National Technical Information Service. Annual subscription is $22 (domestic), $27.50 (foreign), single copy price $3. Certain documents abstracted in this journal can be purchased from the NTIS at prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

VOLUME 4, NUMBER 7
APRIL 1, 1971

W71-03301 -- W71-03850

Use of funds for printing this publication approved by the Director of the Bureau of the Budget, September 4, 1968.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus** (November 1966 edition). Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on inside back cover.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

CONTENTS

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

MATHEMATICAL SIMULATION OF HYDROLOGIC EVENTS OF UNGAGED WATERSHEDS,
Purdue Univ., Lafayette, Ind. Water Resources Research Center.
L. F. Huggins, and E. J. Monke.

Available from NTIS as PB-196 874, $3.00 in paper copy, $0.95 in microfiche. Purdue University Water Resources Research Center Technical Report No 14, Lafayette, Indiana, Dept. of Agricultural Engineering., March 1970. 46 p, 9 fig, 20 ref, append. OWRR Program B-003-IND (8).

Descriptors: *Model studies, *Hydrologic models, *Simulation, Mathematical models, *Watershed, Surface runoff, Overland flow, Depression storage, Interception, Infiltration, Runoff hydrographs.
Identifiers: Hydrologic components.

General modeling concepts and the computational capabilities of a large digital computer was utilized to describe the detailed physical processes occurring within the boundaries of a watershed which in turn could then more precisely characterize the behavior of an entire watershed. It was assumed that a watershed was composed of a composite group of essentially independent elements and that the runoff water from one element was the source of inflow to its adjacent elements. Runoff hydrographs for each elemental area were developed and integrated over the entire watershed. Physical process considered in the model included interception, infiltration, depressional storage and surface flow. A FORTRAN IV program of the mathematical watershed model is included in the report. The model as given is not considered to be in the finished form, but a refinement of the equations governing the component hydrologic relationships is still needed. This applied particularly to the infiltration and surface runoff processes. A primary conclusion was that the strength of the conceptual watershed model as developed was the ease with which it could be modified and improved as individual research advances were made in the areas associated with the various hydrologic components delineated in the model. (Wiersma-Purdue)

DEFINITION AND USES OF THE LINEAR REGRESSION MODEL,
Agricultural Research Service, Tucson, Ariz. Southwest Watershed Research Center.
M. H. Diskin.
Water Resources Research, Vol 6, No 6, p 1668-1673, December 1970. 6 p, 4 fig, 2 tab, 11 ref.

Descriptors: *Regression analysis, *Rainfall-runoff relationships, *Statistical models, Precipitation (Atmospheric), Streamflow forecasting, Runoff forecasting, Water storage, Seasonal.
Identifiers: *Rainfall-runoff models.

A simple three-element model is proposed as an interpretation of the regression equation for the relationship between annual rainfall and annual runoff from watersheds. The model employs two parameters that are related to the constants used in the regression equation. The parameters of the model can be evaluated by the usual least squares equations if the runoff data do not include zero or near zero values. For arid or semiarid watersheds where runoff may be zero for some years, a special procedure is proposed for evaluating the parameters. The procedure seeks the minimum of an objective function defined as the sum of squared deviations between observed data and prediction lines defined by the regression model. (Knapp-USGS)

SOME GENERAL COMMENTS ON THE SYNERGISTIC RUNOFF EFFECT FROM JOINT WATERSHED MANAGEMENT AND WEATHER MODIFICATION,
State Univ. of New York, Syracuse. Water Resources Center.
Richard H. Hawkins.
Journal of Hydrology, Vol 11, No 4, p 412-420, November 1970. 9 p, 2 fig, 9 ref.

Descriptors: *Weather modification, *Water yield improvement, *Watershed management, *Mathematical models, Water yield, Artificial precipitation, Cloud seeding, Rainfall-runoff relationships, Evapotranspiration control.
Identifiers: *Synergistic effects, *Watershed management effects.

The synergistic effect in combined watershed and weather modification efforts is discussed and explored in general terms. Using an annual precipitation-runoff model, it is demonstrated that synergism is an expected phenomenon in models under most conditions and assumptions. An expression for locating the precipitation corresponding to the maximum synergism is presented. Two separate functional models are used to illustrate the use of the general relationships derived, and specific data are used to provide perspective and scale. Expressions for the weather modification efficiencies are presented and discussed. The volumes of the synergistic increases, as drawn from a real example, are quite modest, (about 0.05 inches), and might be undetectable in a real situation. (Knapp-USGS)
W71-03696

THE GENETIC METHOD OF COMPUTATION OF FLOOD CAUSED BY STORM RAINFALLS IN SMALL CATCHMENT AREAS IN THE ABSENCE OF HYDROLOGICAL DATA,
Wyzsza Szkola Rolnicza, Wroclaw (Poland).
J. Woloszyn.
In: Floods and Their Computation, Vol 1, International Association of Scientific Hydrology Publication No 84 (Unesco-WMO), P 301-312, 1969. 12 p, 6 fig, 1 tab, 9 ref.

Descriptors: *Rainfall-runoff relationships, *Depth area-duration analysis, *Water balance, Statistical methods, Routing, Duration curves, Frequency analysis, Rainfall intensity, Rainfall disposition, Small watersheds, Flood forecasting, Runoff forecasting.
Identifiers: Rainfall floods.

A number of well known regional and universal formulas for runoff from storm rainfall are reviewed with emphasis on the formulas which are drawn from the analysis of the genetic formation of runoff. In these the rate of flow depends on intensity and duration of rainfall as well as on basin characteristics and on wave velocity in the stream profile. However, for computation of runoff of a definite probability of occurrence, the rainfall intensity should be determined following the same principles that are applied for the actual series, that is following the distribution of Pearson's type III curve. The distribution of empirical formulas on a group basis is discussed. The probability method for computation of the rainfall intensity, adaptation of this for computing the flow of high water from small basins, and transposing it to uninvestigated areas by means of the monthly mean precipitation and air temperature are illustrated by diagrams and examples. (Knapp-USGS)

METHOD OF COMPUTING RAINFALL FLOODS CHARACTERISTICS,
Kazakhskii Nauchno-Issledovatelskii Gidrometeorologicheskii Institut, Alma-Ata (USSR).
U. B. Vinogradov.
In: Floods and Their Computation, Vol 1, International Association of Scientific Hydrology Publication No 84 (Unesco-WMO), p 312-320, 1969. 9 p, 1 tab, 1 ref.

Descriptors: *Flood forecasting, *Rainfall-runoff relationships, Water balance, Hydrograph analysis, Stochastic processes, Probability, Routing, Infiltration, Hydrologic budget, Frequency analysis.
Identifiers: Rainfall floods.

The main relationships of infiltration processes, surface and rapid subsurface runoffs, and flood formation are examined. The basic formulas to compute infiltration, runoff, hydrographs of inflow to the channel network and runoff at the outlet are given. The fundamental theory of random functions is applied to analyze the process of precipitation and to compute surface runoff. The statistics of distribution curves of daily totals of precipitation and duration of rainfall are discussed with special attention paid to the composition method of determining the probability characteristics of rainfall floods. The possibility of mapping the parameters of distribution curves of precipitation and of systematizing the physical parameters of drainage basins is illustrated by an example from Central Asia and the South Kazakhstan mountain area. (Knapp-USGS)

CONTRIBUTION TO THE METHODOLOGY OF EVALUATION OF MAXIMUM FLOOD FLOW WHEN AVAILABLE DATA ARE INSUFFICIENT (FRENCH),
Office de la Recherche Scientifique et Technique Outre--Mer, Paris (France).
J. Rodier.
In: Floods and Their Computation, Vol 1, International Association of Scientific Hydrology Publication No 84 (Unesco-WMO), p 283-289, 1969. 7 p, 3 ref.

Descriptors: *Flood forecasting, *Rainfall-runoff relationships, Hydrographs, Duration curves, Routing, Stream gages, Hydrologic data, Design flood, Peak discharge.
Identifiers: Isochrone method.

Methods used in the Hydrological Service of the ORSTOM for rainfall floods in Africa, on islands of the Indian Ocean and in the Pacific, are presented. The management and the study of numerous representative basins led to general methods for determining the elements of the rainfall-runoff relations and for estimating floods on small basins without observational data. It is possible to transfer these methods to other regions provided that some adjustments are made to the rainfall and flood regimes. The relations between the decennial or centennial floods and median floods for large basins in Central Africa are determined. With adjustments for natural conditions they are applied to basins with few records. For medium basins the method of isochrones is used, especially for maximum possible floods and for the case of a cyclonic regime. In this case the envelop curves are used as well. (Knapp-USGS)

EXPERIMENTAL STUDY OF RAINFALL RUNOFF,
Gidrometeorologicheskii Institut, Odessa (USSR).
A. N. Befani, N. F. Befani, E. D. Goptchenko, A. G. Ivanenko, and T. V. Odrova.
In: Floods and Their Computation, Vol 1, International Association of Scientific Hydrology Publication No 84 (Unesco-WMO), p 274-282, 1969. 9 p, 4 ref.

Descriptors: *Rainfall-runoff relationships, *Hydraulic models, *Computer models, Demonstration watersheds, Simulated rainfall, Infiltration, Runoff, Groundwater movement, Water balance, Hydrologic budget, Routing, Mathematical studies, Drainage, Seepage.
Identifiers: Runoff models.

Results of long-term experimental research on rainfall-runoff on plain and mountain watersheds situated in different regions of the USSR are discussed. Methods of active experimentation include sprinkling of plots and natural small drainage basins, slope submersion, and pit digging. The results obtained are outlined. Data generalization methods are explained. Experimental formulas determining surface absorption, infiltration into an underlying confining layer on mountain slopes, soil retention of a friable rock layer in mountainous regions, accumulation, residual (contact and general) water storage on slopes, time of travel of surface and contact (drainage and confined) waters and contact and surface components of flood runoff are given. Special attention was paid to data generalization techniques using electronic omputers. A comparison of results obtained by using experimental formulas and data of experimental stations is given. Fair agreement between computations and flood data prove the suitability of the experimental method and its useful role in flood studies. (Knapp-USGS)
W71-03719

RAINFALL FLOOD FORMATION THEORY AND METHODS OF RAINFALL FLOOD COMPUTATION,
Gidrometeorologicheskii Institut, Odessa (USSR).
A. N. Befani.
In: Floods and Their Computation, Vol 1, International Association of Scientific Hydrology Publication No 84 (Unesco-WMO), p 259-273, 1969. 15 p, 5 ref.

Descriptors: *Rainfall-runoff relationships, *Flood forecasting, Stage-discharge relations, Floods, Flood plains, Runoff, Runoff forecasting, Design flood, Hydraulics, Routing.
Identifiers: USSR, Rainfall floods.

Fundamentals of the theories used in the USSR of different rainfall runoff types include: suspended surface runoff, comprising the predominant part of the surface inflow of rivers of the plains and a certain part of mountain river runoff; backwater surface runoff from mountain slopes arising as a result of saturation of friable ground;backwater runoff from flooded lowlands; and contact runoff from mountain slopes in friable sediment strata overlying a relatively confining layer (drainage, vein, stratum and fissure runoff). Formulas for runoff depth computation and hydrograph equations are proposed for each type of runoff. For mixed (rainfall and snowmelt) floods theoretical formulas of contact and surface components are elaborated. The problem of derivation on a theoretical basis of design formulas is set and solved as a tak of a regional nature, because the nature and genesis of floods vary from one region to another; hence the combinations of factors vary as well. Methods of calculation of regional runoff relationships including formulas of accumulation and reduction of precipitation, typical equations of rainfall graphs, isochron curves, retention, absorption and infiltration formulas, etc. are discussed. Primary attention is paid to the slope water formation (difference of precipitation and simultaneous losses) design problem. Two designs are based on: (1) Obtaining series of water formation on various arable lands using infiltration formulas (synthetic method) and (2) Mapping of the water formation conditional coefficient (the ratio of water formation and precipitation depth of the same frequency). (Knapp-USGS)

THE EFFECT OF RAINDROP IMPACT AND SURFACE ROUGHNESS ON SHEET FLOW,
Illinois Univ., Urbana. Water Resources Center.
Harry G. Wenzel.
Favailable from NTIS as PB-196 664, $3.00 in paper copy, $0.95 in microfiche. Final Report, Illinois Water Resources Center, Urbana, WRC Research Report No 34, September 1970. 115 p, 34 fig, 23 ref, append. OWRR Project B-018-ILL (3).

Descriptors: *Impact (Rainfall), Numerical analysis, *Raindrops, Resistance, Roughness (Hydraulic), *Shear stress, *Sheet flow, Soil erosion, Transition flow, *Turbulence, Flow, Rainfall, Reynolds number, Sheet erosion.

An experimental and analytical study was conducted to investigate the mechanics of sheet flow as it is affected by rainfall. Water surface profile data were taken in a laboratory flume using artifically generated rainfall and a hydraulically smooth surface. The one-dimensional spatially varied flow equation as developed from the momentum approach was then used to compute the boundary shear stress and subsequently a Weisbach type friction factor. It was found that the results below a Reynolds number of approximately 1000 could be expressed as f — C/NR where C increases with increasing rainfall intensity and suface slope. Velocity profile studies show that velocity in the surface region is retarded by the rainfall. Turbulence intensity measurements indicate that turbulence is generated at the surface due to the rainfall and also at the boundary for flow which would normally be laminar without rainfall. Special analysis of the turbulent measurements indicates that the rainfall shifts the turbulent energy to higher frequencies than would be the case without rainfall. Analysis of the flow over rough surfaces taken by the Corps of Engineers shows that rainfall has little effect on resistance beyond the transition region and the transition point may be lowered by the presence of rainfall. A separate study of a single drop striking a stagnant water layer shows that the velocity and pressure field can be computed using a Synthetic Cell-Fluid scheme to solve the Navier-Stokes equations for this case. A dimensionless maximum impact pressure model was developed and the velocity field and freee surface configuration were studied. It was found that surface tension is significant, the diameter of the region of disturbance was approximately one inch, and that locally high shear stress are generated. These stresses could easily cause soil erosion.
W71-03310

TEMPORAL VARIATIONS IN THE NATURE OF ATMOSPHERIC DUST ABOVE AN INTERIOR DESERT BASIN,
Atmospheric Sciences Lab., White Sands Missile Range, N. Mex.
Glenn B. Hoidale, and Abel J. Blanco.
Archiv Fur Meteorologie, Geophysic und Bioklimatologie, Series A, Vol 19, No 1, p 71-88, 1970. 7 fig, 3 tab, 8 ref.

Descriptors: *Advection, *Dusts, *Spectroscopy, *Atmospheric physics, *Topography, Particle size, Precipitation (Atmospheric), Convection, Infrared radiation, Aerosols, New Mexico, Deserts, Arid lands, Great Plains, Silicates, Clays, Carbonates, Absorption, Topography, Meteorology, Aeolian soils, Spectrophotometry, Winds, Air circulation, Cloud physics, Diurnal distribution, Southwest U.S., Variability, Fronts (Atmospheric).
Identifiers: *Infrared absorption, *Exchange layers.

The infrared absorptive properties of giant and large atmospheric dust particles have been little studied. The arid southwestern U.S. has a abundance of loose, unconsolidated soil particles exposed to eolian translocation and various meteorological factors which effect a transport of this mineral-laden dust in high-atmospheric concentrations to other geographical areas which in turn may affect the composition and transmission properties of the atmospheric dusts of those areas. Dust from the tropospheric aerosol was sampled on a 1250 m. peak overlooking the arid Tularosa Basin. The infrared absorption spectrum was dete

mined and interspectral variations were quantified by the relative intensities of silicate clay and carbonate absorption bands (A/B ratio). A systematic temporal variation of the A/B ratio occurred. The ratio was high during early morning periods of convective activity, precipitation and cold frontal passages from the east and low in the afternoon at in times of low convection or precipitation. Apparently, advection of fresh particles from adjacent regions exchange layer caused the low ratio and the high ratio was caused by advected fresh continental particles from the western Great Plains and aged particles from the free atmosphere. (Casey-Arizona)

METEOROLOGICAL DATA AND THE AGRICULTURAL PROBLEM,
Connecticut Agricultural Experiment Station, New Haven.
P. E. Waggoner.
Agroclimatological Methods; Proceedings of the Reading Symposium, Natural Resources Research, Vol 7, p 25-38, UNESCO, 1968. 2 fig, 3 tab, 50 ref.

Descriptors: *Evapotranspiration, *Precipitation (Atmospheric), *Climatology, *Solar radiation, *Decision making, Arid lands, Droughts, Agriculture, Temperature, Wind velocity, Evaporation, Economic justification, Planning, Vapor pressure, Probability, Probable maximum precipitation, Project planning, Cost-benefit analysis, Forecasting, Statistical methods, Meteorological data.
Identifiers: *Agriclimatology, *Decision matrices, *Gumbel distribution.

The major importance of agricultural climatology lies in providing information for long-term investment strategies. Operationally, this involves construction of a decision matrix in which planning alternatives and profit data suitable to a given situation entered with meteorological data. If profit expectations between alternatives are different, then action is justified. Useful meteorological data will permit profitability predictions in new projects and will be less useful to traditional agriculture. A suitable weather parameter must therefore be determined, together with useful probabilities, for inclusion in the decision matrix. Drought is the crucial factor in crop growing and is a function of both precipitation and evaporation. Evaporation is focussed upon as the more crucial factor and the Penman method of daily evapotranspiration calculation is described. It is shown that with this criterion, radiation data is most important and humidity and wind speed less important. For a decision matrix, probabilities rather than means are the important climatological figures. When drought indices, precipitation and temperature data were reviewed, it was found that a suprisingly small amount of data from a single station allows an estimate of probabilities. (Casey-Arizona)

THE EFFECT OF WIND ON THE PRECIPITATION DISTRIBUTION OVER A HILLOCK,
John Sandsborg.
Nordic Hydrology, Vol 1, No 4, p 235-244, 1970. 10 p, 6 fig, 2 tab, 6 ref.

Descriptors: *Rain gages, *Rainfall disposition, *Distribution patterns, Meteorology, Equipment, Networks, Calibrations, Precipitation gages, Gaging stations.
Identifiers: Sweden.

Precipitation measurements were made on a hillock during June-November 1959 by means of a very dense network of gages. The precipitation distribution of single rainfall could vary considerably owing to wind conditions. The cause of this phenomenon seems to lie in the aerodynamic conditions around the hillock. When choosing sites for precipitation measurements such aerodynamic effects should be known. The leeward side receives less precipitation than the windward side. This is especially the case for rainfalls in high wind, when the crest of the hillock also has markedly lower precipitation values than the precipitation mean. (Knapp-USGS)

SOLID PRECIPITATION IN SUPER-COOLED CLOUD: PART 1 - FREEZING OF A SUPERCOOLED WATER DROP DUE TO THE COLLISION OF ICE CRYSTALS,
Nagoya Univ. (Japan). Water Research Lab.
Takao Takeda.
Journal of Meteorological Society of Japan, Series 2, Vol 46, No 1, p 14-28, February 1968. 15 p, 9 fig, 1 tab, 17 ref.

Descriptors: *Precipitation (Atmospheric), *Cloud physics, *Supercooling, *Condensation, Ice, Nucleation, Atmospheric physics, Statistical methods, Velocity, Clouds, Freezing, Winds, Crystal growth.
Identifiers: Supercooled clouds.

The freezing-probability of a supercooled water drop, which grows by the capture of cloud droplets due to the collision of ice crystals formed on ice nuclei, was numerically studied in clouds. In all cases, the probability increases about 100 times when the drop is at cloud top, and most of collisions with ice crystals take place when the drop stays near cloud top. The accumulated number of ice crystals colliding with the drop increases with the vertical velocity of air-currents and the height of cloud top. The accumulated number of colliding ice crystals is larger in clouds of small water content than in clouds of large water content, although it tends to increase with the water content in early stage of the growth of the drop. In clouds with tops lower than 3000 m and with velocity of updraft of only a few meter/sec, at most, one drop in 10 to 100 supercooled water drops can collide with one ice crystal in 1.0 to 1.5 hour. (See also W71-03433) (Knapp-USGS)
W71-03432

SOLID PRECIPITATION IN SUPERCOOLED CLOUD: PART 2 - GROWTH OF A SOLID PRECIPITATION PARTICLE,
Nagoya Univ. (Japan). Water Research Lab.
Takao Takeda.
Journal of Meteorological Society of Japan, Vol 46, No 4, p 255-265, August 28, 1968. 11 p, 6 fig, 1 tab, 16 ref.

Descriptors: *Precipitation (Atmospheric), *Cloud physics, *Supercooling, *Condensation, Ice, Nucleation, Atmospheric physics, Statistical methods, Velocity, Clouds, Freezing, Winds, Crystal growth.
Identifiers: Supercooled clouds.

The growth rates of solid precipitation particles in a supercooled cloud were studied by numerical computations for the case when sublimation and the capture of cloud droplets take place simultaneously. The necessary condition for the predominance of the capture-process in the growth of solid precipitation particles (for the formation of graupel) is that the particle is initially a 'frozen drop' with radius larger than a critical value which is dependent mainly upon the initial height of the particle. The relationship between the computed radii of graupel particles at cloud base and the height of the cloud top is in satisfactory agreement with that obtained from observations. The computed probability that 'frozen drops' of the critical size are formed by nucleation of supercooled water drops in collision with ice crystals is about 10% of that expected from observations. Descriptors: *Precipitation (Atmospheric), *Cloud physics, *Supercooling, *Condensation, Ice, Nucleation, Atmospheric physics, Statistical methods, Velocity, Clouds, Freezing, Winds, Crystal growth.
Identifiers: Supercooled clouds.

The influence of the time lag in the activation of ice nuclei on the number of ice crystals in clouds was numerically studied. The increase in the number of activated atmospheric ice nuclei with cooling-time is remarkable, particularly cooling at lower temperatures than -25 deg C. The total number of atmospheric ice nuclei activated in a few hours under cooling at -30 deg C to -40 deg C is 10 times as large as in 1 minute, while the number of activated at temperatures warmer than-20 deg C is at most 3 times as large. The number of atmospheric ice nuclei activated in upward air-currents with vertical velocities of the order of 10 cm/s is 5 to 10 times as large as in air-currents of the order of 10 m/s. AD HOC MEETING ON ACIDITY AND CONCENTRATION OF SULPHATE IN RAIN.
Organization for Economic Co-Operation and development, Paris (France).

Organization for Economic Co-Operation and Development, Ex 40119, 1970. 19 p, 1 fig, 7 tab, 2 append.

Descriptors: *Precipitation (Atmospheric), *Rain, *Sulfates, *Acidity, Metereology, Air pollution, Monitoring, Water pollution sources, Data collections, Carbonates, Electrical conductance, Conferences.
Identifiers: *OECD, *Sulphur dioxide, Sweden, Norway, Finland, Denmark, Iceland, Austria, United Kingdom, Ireland, Germany, Netherlands, Belgium, France.

This 1969 report by the representatives of seven European countries surveys the problem of precipitation, its acidification, and sulphate content. The report is supplemented by a record of pertinent data compiled by Swedish workers in 12 countries of western Europe. Their atmospheric chemistry network detected an overal increase in acidity of precipitation in Scandinavia and central Europe, but not in Great Britain or Ireland. A similar trend was recorded in regard to the concen-

tration of sulphates. As atmospheric sulphur compounds are transported over long distances, remedial measures require international collaboration. (Wilde-Wisconsin)

PERSISTENCE OF PRECIPITATION AT 108 CITIES IN THE CONTERMINOUS UNITED STATES,
Weather Bureau, Silver Spring, Md.
Donald L. Jorgensen, and William H. Klein.
Environmental Sciences Service Administration Technical Memorandum WBTM TDL 31, May 1970. 84 p, 6 fig, 3 tab, 14 ref, 2 append.

Descriptors: *Precipitation (Atmospheric), *Weather data, *Meteorological data, Data collections, Probability, Weather forecasting, Statistical methods, Weather patterns.
Identifiers: *Persistence (Precipitation).

Values of persistence of precipitation for each of the four seasons have been derived for 108 cities in the conterminous United States. These values show significant differences between stations and seasons and show general behavior of storm systems and atmospheric circulations responsible for precipitation occurrences. Examples are given illustrating the application of persistence to the forecasting problem. The relationship between persistence and the coefficient of correlation involving successive precipitation events is developed. The data presented should serve as important supplementary information in evaluating continuity trends in precipitation. Persistence determinations are presented in tabular form. The basic data on which these derivations are made consist of 15 years of precipitation records for the period December 1949 through November 1964. Persistence is determined for each of the cities by seasons on the condition that precipitation occurred or did not occur in the conditional (preceding) period for eight verifying periods consisting of four 6-hour, two 12-hour, and two 24-hour periods. Identifiers: *Agroclimatology, *Potential evapotranspiration, *Bowen ratio, *Leaf tissue suction, *Partial soil cover, Evaporating surface roughness.

Real evapotranspiration is a function of interacting meteorological, plant physiological and soil physical factors. Since the energies available for water vaporization and vapor transport are the crucial meteorological factors determining evapotranspiration rate, it may be calculated using the turbulent vapor transport method or the Bowen ratio method, and approaches utilizing these methods are discussed. In agricultural and hydrological applications they are limited by the complex instrumentation required. Combined aerodynamic and energy balance methods using standard meteorological data are more practical. Precipitation interception increases total evapotranspiration under all conditions in which reduced transpiration is present. Crop diffusion resistance, which depends on number and size of stomata and the soil cover, can be used to calculate crop transpiration. Real transpiration equals crop transpiration plus intercepted precipitation evaporation. Calculations using this relationship are shown to agree closely with measured evapotranspiration values. Direct determinations of evapotranspiration using the Bowen ratio and turbulent vapor transfer methods combined with lysimeter studies, suffer from the lack of data on evaporating surface roughness, partial soil cover, light intensity, leaf tissue suction and interception. THE USE OF SOIL WATER BALANCE RELATIONSHIPS IN AGROCLIMATOLOGY,
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia). Div. of Land Research and Regional Survey.
R. O. Slatyer.
Agroclimatological Methods; Proceedings of the Reading Symposium, Natural Resources Research, Vol 7, p 73-87, UNESCO, 1968. 9 fig, 4 tab, 60 ref.

Descriptors: *Evapotranspiration, *Measurement, *Water balance, *Soil-water-plant relationships, *Soil water, Arid lands, Lysimeters, Runoff, Precipitation (Atmospheric), Deep percolation, Instrumentation, Estimating equations, Physiological ecology, Climates, Climatology, Environmental effects, On-site data collections, Evaporation, Interception, Stemflow, Xerophytes, Root systems, Leaves, Crops, Rainfall-runoff relationships, Mode studies, Mode of action, Probability, Probable maximum precipitation, Irrigation efficiency, Planning, Soil water movement, Water storage, Storage capacity.
Identifiers: *Agroclimatology, *Potential evapotranspiration, *Soil water balance, *Australia.

Utilization of soil water balance data for agroclimatological purposes presents many problems where there is a lack of meteorological data. The soil water balance equation includes precipitation, runoff, deep drainage, evapotranspiration, and changes in soil water storage. Evapotranspiration is usually deduced from measurements of the other factors. Discussions of each factor in the equation indicate problems involved in measurements, particularly in arid lands. Agroclimatological models using soil water balance data are usually set up on the basis of water budget. Consequently, they require relationships which predict: (1) available soil water storage capacity in the root zone, (2) soil water storage increments resulting from precipitation, (3) drainage below the root zone and (4) surface evapotranspiration. Attempts to predict these phenomena under varying conditions for irrigation planning purposes require simplifying assumptions often likely to lead to error, particularly in arid lands. Factors involving model development for use in the Alice Springs area, Australia, are detailed. Actual potential evapotranspiration patterns for

lifferent sites and methods for testing and utilizing hese models are described. In communities with videly spaced plants, the accuracy of the evapotranspiration model is unsatisfactory. (Casey-Arizona)

INHIBITION OF OXYGEN EVOLUTION IN CHLOROPLASTS ISOLATED FROM LEAVES WITH LOW WATER POTENTIALS,
Illinois Univ., Urbana. Dept. of Botany.
J. S. Boyer, and Barbara L. Bowen.
Plant Physiology, Vol 45, p 612-615, 1970. 5 fig, 19 ref. OWRR Project A-028-ILL (1).

Descriptors: *Photosynthesis, *Photosynthetic oxygen, *Leaves, *Inhibition, *Drying, Analytical techniques, Wilting, Carbon dioxide, Plants, Stomata, Centrifugation, Plant tissue, Light intensity, Transpiration control, Measurement, Moisture content, Oxygen, Plant physiology.
Identifiers: *Chloroplasts, *Water potential, *Oxygen evolution, Carbon dioxide evolution, Alaska pea, Sunflower.

Research was undertaken to determine whether O sub 2 evolution by chloroplasts is inhibited when leaves are exposed to moderate desiccation. Chloroplasts were isolated from leaves of Alaska pea and sunflower by a micro Waring blander and centrifugation. Oxygen evolution was measured with a Clark-type electrode in an assay medium illuminated to saturation into which chloroplasts were injected. Controls from non-desiccated leaves were also measured. Co sub 2 fixation by intact plants was measured for comparisons, using an infrared gas analyzer. Transpiration was measured by collecting water condensed in the assimilation chamber. Isolation of chloroplasts had no effect on O sub 2 evolution. O sub 2 evolution by chloroplasts was reduced in tissue moderately desiccated. The degree of desiccation was more important than the duration. The magnitude of inhibition depended on the species: sunflower was more inhibited than pea. Low leaf water potential affects photosynthesis by inhibition of O sub 2 evolution in chloroplasts and by closure of stomata in intact leaves. Inhibition of O sub 2 evolution has not been previously described in moderately desiccated leaves. Increases in cytoplasmic resistance to CO sub 2 diffusion are probably related to chloroplast changes. The article contains 5 graphs which support the conclusions. (Yensen-Arizona)

A STUDY OF EVAPORATION SUPPRESSANTS UNDER GREENHOUSE CONDITIONS: EVALUATIONS I TO IV,
Texas Agricultural Experiment Station, College Station.
C. W. Wendt, and J. R. Runkles.
Texas A and M University, Texas Agricultural Experiment Station, Progress Reports: I, PR-2510, (Feb 1968); II, PR-2542, (May 1968); III, PR-2647, (Feb 1969); IV, PR-2646, (Feb 1969). 33 p, 4 fig, 4 tab, 8 ref. OWRR Project B-002-TEX.

Descriptors: *Evaporation control, *Greenhouses, Evaluation, *Soil moisture, *Soil water, Hexadecanol, Ions, Alcohols, Texas, Arid lands, Evaporation, Oxides, Loam, Surfactants, Rates of application, Water loss, Moisture content, Data collections, Treatment.
Identifiers: *Crude oil, *Oils, *Hyamine, *Cations, Triton, Latex, Gums, Silicones, Ionic additives, Texas High Plains, Semiarid lands.

These four evaluations trace the progress of greenhouse experiments to suppress evaporation from soils in the Texas High Plains, where 60 percent of the added rainfall and irrigation water evaporates. Suppressants evaluated were crude oil with and without ionic additives, an oil-latex mixture, polyethylene oxides, silicones, polysaccharide-gum mixture, an amonic and a fatty alcohol. Crude-oil contained suppressants had slower initial evaporation rates from soil pots, while other materials were ineffective, Catonic oil, oil-latex mixture, and polysaccharide-gum mixture further suppressed soil water evaporation. The order of cationic oil effectiveness was Hyamine 3500 more than Hyamine 2389 equal to Hyamine 1622 equal to Triton X-400 more than X-150. Hexadecanol suppressed evaporation less than crude oil. Tables and figures illustrate and quantify these results. (Popkin-Arizona)

MEAN EVAPORATION OVER CANADA,
Meteorological Service of Canada, Toronto (Ontario).
H. L. Ferguson, A. D. J. O'Neill, and H. F. Cork.
Water Resources Research, Vol 6, No 6, p 1618-1633, December 1970. 16 p, 10 fig, 2 tab, 19 ref.

Descriptors: *Evaporation, *Synoptic analysis, *Mapping, Water balance, Hydrologic budget, Maps, Hydrologic cycle, Data collections, Meteorological data, Evaporation pans.
Identifiers: *Canada, *Evaporation maps.

Mean monthly and annual maps of evaporation over Canada were prepared. The maps represent time and space averages of evaporation from natural open water bodies having negligible heat storage. The analysis is based on 5-year class A evaporation pan data supplemented by 10-year climatologic data from 100 stations across Canada. The Christiansen formula is shown to be superior to other formulas tested for approximating pan data from other standard climatologic observations. The analysis takes account of the seasonal effects of freeze-up and breakup on the availability of open water. A zonal classification of lake evaporation that emphasizes the large-scale climatic variations in this parameter across Canada is proposed. (Knapp-USGS)

EVAPORATION STUDIES IN STANDARD CATCHMENTS,
Manchester Univ. (England).
H. S. Takhar, and A. J. Rudge.
Journal of Hydrology, Vol 11, No 4, p 329-362, November 1970. 34 p, 15 fig, 6 tab, 9 ref.

Descriptors: *Evapotranspiration, *Evaporation, Meteorological data, Energy budget, Lysimeters, Evaporation pans, Regression analysis, Runoff forecasting.
Identifiers: *Potential evapotranspiration.

When estimates of monthly potential transpiration were obtained from meteorological records using theoretical and empirical methods, conflicting trends are revealed by the Penman combination model and the empirical models used. Estimates from short term records from three standard experimental catchments were compared with each other and with observed estimates obtained from lysimeter and evaporation pan readings. Despite significant random errors, the lysimeter estimates appear to be the best. The empirical models indicate very little, of the spatial variation in potential transpiration shown by the other methods and their usefulness therefore seems to be restricted. The accuracy of the Penman model appears to vary greatly from site to site. (Knapp-USGS)

THE USE OF PANS AND A THEORETICAL MODEL TO DEFINE THE ROLE OF EVAPORATION IN THE WATER BUDGETS OF THE CITY OF LARAMIE AND THE STATE OF WYOMING,
Wyoming Univ., Laramie. Dept. of Civil Engineering.
Dennis J. Brown.
MS Thesis, Wyoming University, June 1970. 133 p, 21 fig, 18 tab, 37 ref, 2 append. OWRR Project A-001-WYO (34).

Descriptors: *Evaporation, *Hydrologic data, *Evaporation pans, *Water balance, *Wyoming, Methodology, Climatology, Hydrologic cycle, Meteorology, Solar radiation, Temperature, Lakes, Surface waters, Water balance, Water loss, Wind velocity, Latent heat, On-site data collections.
Identifiers: *Laramie (Wyo), *Evaporation prediction, *Potential evaporation, *Lake evaporation, *Evaporation-analysis methods (Comparison).

Results of estimates of evaporation obtained by means of the inflow-outflow method, evaporation pans, and theoretical equations are compared. Relative amounts of annual evaporation determined by evaporation pans and by theoretical equations are estimated for locations throughout the State of Wyoming, and are compared to current evaporation maps. The water budget study of the Laramie sewage lagoon system provided evidence that the 0.7 Class A pan coefficient is applicable as a means for determining reservoir evaporation. The model equation for lake evaporation derived by Kohler, Nordenson, and Fox provides a more reliable means of estimation since it corrects the amount of pan evaporation for the effects of advected energy through the pan, and for differences in temperature between the air and the water in the pan. Lake evaporation in the Laramie area is equal to approximately 55 inches per year. The amount is appreciably more than the 38 inches read from current evaporation maps of the United States. STREAMFLOW GENERATING TECHNIQUES: A COMPARISON OF THEIR ABILITIES TO SIMULATE CRITICAL PERIODS OF DROUGHT,
California Univ., Los Angeles. School of Engineering and Applied Science.
Arthur J. Askew, William W-G Yeh, and Warren A. Hall.
Univ of Calif, Water Resources Center, Contrib No 131, Report No 70-5, January 1970. 24 p, 1 fig, 3 tab, 18 ref, 2 append. OWRR Project B-061-CAL (5).

Descriptors: *Streamflow, *Simulation analysis, *Droughts, *Rivers, *Computer programs, Reservoirs, Watersheds, Time, Cost, Synthetic hydrology, Statistical models, Reservoir design, Mathematical models, Streamflow, Forecasting.
Identifiers: *Critical periods, Synthetic streamflow records.

A set of monthly streamflow records were generated and analyzed to derive a set of synthetic critical periods. Some characteristics of these

periods were determined, and the mean and standard deviation of their values were compared with the appropriate values for the historic critical period. The procedure was repeated for twenty-six different rivers, using ten generating techniques. A study of the results allowed a comparison to be made between the generating techniques in regard to both their cost in computer time and their ability to synthesize critical droughts by the relative aridity of watershed, and by the size of the reservoir considered. In addition, some general conclusions were drawn regarding the advisibility of using generated streamflow in studies of reservoir design and operation. (Kriss-Cornell)

INFLOW OF RIVER WATER TO THE BALTIC SEA IN THE PERIOD 1951-1960,
State Inst. for Hydrology and Meteorology, Warsaw (Poland).
Z. Mikulski.
Nordic Hydrology, Vol 1, No 4, p 216-227, 1970. 12 p, 2 fig, 3 tab, 19 ref.

Descriptors: *Water balance, *Sea water, *Inflow, Hydrologic budget, Streamflow, Snowmelt, Runoff, Precipitation (Atmospheric).
Identifiers: *Baltic Sea.

The inflow of river water to the Baltic Sea is evaluated for the period 1951-60. A proposal is made for a re-evaluation of the estimates for earlier periods and for future computations on a continuous basis. The Baltic Sea received in the period 1951-1960 about 440 cu km of water. The annual discharge into the Baltic corresponds to 2 percent of the total water volume. Studies recently made in Poland indicate that the discharge in the period 1951-1960 was several percent below the long-term average. The greatest inflow of stream water is in spring (April-June) with a maximum in May (14 percent). Minimum inflow, amounting to 50 percent of the maximum values, occurs in winter (November-January), at the period of dominant sea storms. (Knapp-USGS)

AN IMPLEMENTATION OF STAGE-FALL-DISCHARGE RELATIONSHIP ON DIGITAL COMPUTERS,
Norges Vassdrags- og Elektrisitetsvesen, Oslo.
Bo Wingard.
Nordic Hydrology, Vol 1, No 4, p 228-234, 1970. 7 p, 1 fig, 3 tab, 3 ref.

Descriptors: *Stage-discharge relations, *Data processing, *Digital computers, Slopes, Open channel flow, Discharge coefficients, Streamflow, Water levels, Mannings equation, Discharge measurement.
Identifiers: Norway.

Discharge conversions on digital computers for gages where a slope-stage discharge relationship is recommended seem to give good results by employment of a relationship between the mean-stage and the friction parameter. The method gave satisfactory accordance between computed and measured discharge. A correction of the friction curve on the basis of later measurement is simple. As with all slope-stage-discharge methods, the discharge measurements have to be made over a sufficiently long mean-stage and discharge interval. (Knapp-USGS)

PARAMETERIZATION OF OBSERVED HYDROGRAPHS,
Vermont Univ., Burlington. Dept. of Civil Engineering.
Richard N. Downer.
Available from NTIS as PB-196 899, $3.00 in paper copy, $0.95 in microfiche. Vermont University Water Resources Research Center Report 1, December 1970. 57 p, 6 fig, 5 tab, 14 ref, 2 append. OWRR Project No A-008-VT (1).

Descriptors: *Hydrograph analysis, *Statistical methods, *Computer programs, Regression analysis, Routing, Flood forecasting, Computer models, Hydrographs, Mathematical models, Simulation analysis, Data processing, Optimization, Least squares method, Vermont.
Identifiers: *Curve fitting, Sleepan River watershed (Vt.).

A simple transformation of the incomplete gamma function was used to describe single-peaked hydrographs. A weighted least-squares method produces a forced fit of the crest portion of the observed hydrograph. In addition to determining the parameters of the fit with minimum squared deviations, the computer plots the original and fitted hydrographs and calculates statistics to assist in making an objective decision as to the hydrological goodness-of-fit. A good least-squares fit does not necessarily result in a good hydrologic fit. Judgment of goodness-of-fit on the central portion of the hydrograph is aided by a significance test which combines the number of data points with features of the ocular fit (balancing of volumes and minimizing of deviations). The complete goodness-of-fit test assumes that: (1) the assumed model is correct; and (2) if the model is a correct one, there is a close mathematical relation between the observed and fitted data. Identifiers: *Blackman-Tukey method, *Pow spectrum analysis.

To determine whether the Blackman-Tukey or t fast Fourier transform (FFT) technique should used to compute power spectra, single and cro spectra were computed by each approach to pr vide an empirical means for determining whi should be used. The spectra were computed for fi time series, two sets of which were actual field da

In general the two approaches give similar estimates. For a spectrum with a large slope, the FFT approach allowed more window leakage than the Blackman-Tukey approach. On the other hand, the Blackman-Tukey approach demonstrated a better window closing capability. It is concluded that the Blackman-Tukey technique is more effective than the FFT approach in computing power spectra of short historic time series, but for long records the fast Fourier transform is the only feasible approach. A STOCHASTIC MODEL FOR FLOOD ANALYSIS,
Colorado State Univ., Fort Collins.
P. Todorovic, and E. Zelenhasic.
Water Resources Research, Vol 6, No 6, p 1641-1648, December 1970. 8 p, 9 fig, 7 ref. NSF Grants 11444 and 11499.

Descriptors: *Stochastic processes, *Statistical models, *Flood forecasting, Frequency analysis, Time series analysis, Pennsylvania, Probability, Data collections, Hydrograph analysis, Model studies, Mathematical models.
Identifiers: *Stochastic models, *Flood analysis, Susquehanna River (Pa.).

A stochastic model, based on the recent developments in the theory of extreme values, is presented to describe and analyze excessive streamflows. The model is a particular stochastic process defined as the maximum term among a random number of random observations in an interval of time. Since the number of hydrographs peaks that exceed a certain level and the magnitudes of these peaks are random variables, the model seems to conform well to the flood phenomenon. The passage time of the process relevant to the risk evaluation in the design of hydraulic structures is also considered. The results obtained are applied on the 72-year record of the Susquehanna River at Wilkes-Barre, Pennsylvania. Theoretical and observed results agree reasonably well. (Knapp-USGS)

STATISTICAL DECISION THEORY TECHNIQUES FOR THE REVISION OF MEAN FLOOD FLOW REGRESSION ESTIMATES,
Carnegie-Mellon Univ., Pittsburgh, Pa.
Richard M. Shane, and Donald P. Gaver.
Water Resources Research, Vol 6, No 6, p 1649-1654, December 1970. 6 p, 2 tab, 9 ref.

Descriptors: *Flood forecasting, *Decision making, *Regression analysis, *Statistical models, Flood protection, Economics, Time series analysis, Probability, Frequency analysis, Data collections, Peak discharge, Variability.
Identifiers: *Flood analysis, Flood peak forecasting.

Two statistical estimating procedures are presented for using regression information along with direct observations to obtain estimates of the expected value of peak flood discharge rates exceeding a constant base. The first type of estimate represents the minimum mean squared error linear combination of regression and direct estimates, whereas the second is a Bayesian estimate based on an objective prior distribution associated with the regression model. A comparison of combined estimates to regression and direct estimates used alone indicates that a significant reduction in the mean squared error is obtained by using combined estimates. A comparison of the two methods for obtaining a combined estimate indicates that in many cases they both give essentially the same result. (Knapp-USGS)

Water Resources Research, Vol 6, No 6, p 1655-1667, December 1970. 13 p, 9 fig, 5 tab, 14 ref.

Descriptors: *Rainfall-runoff relationships, *Flood forecasting, *Peak discharge, *Rainfall intensity, *Statistical methods, Probability, Pennsylvania, Correlation analysis, Variability.
Identifiers: *Flood analysis.

Annual series of maximum instantaneous flood peaks from 26 Pennsylvania watersheds smaller than 200 square miles were analyzed by the Gumbel, log Gumbel, and log Pearson 3 methods. An empirical appraisal of how well each of these mathematical curves fits the data shows the general applicability of the straight Gumbel line. Consistent overestimation of long return period extremes results from using the log Gumbel analysis. Advantages of slight flattening for very rare expectations, which can result from the log Pearson 3 and the types of data sets preventing overestimation, are discussed. Corresponding histories of daily and clock hourly extreme rainfall annual series were compared to flood series for 24 watersheds that had more than one half of their drainage areas within a 14-mile radius of the rain gage. Extreme rains that occur during the spring are more strongly linked to annual floods than yearly maximum rainfalls are. No usable relationship could be found between the extreme value statistics of rainfall and floods. (Knapp-USGS)

MULTIPLE GRAVITY WELLS UNDER TRANSIENT STATES OF FLOW,
North Carolina State Univ., Raleigh.
Abdel-Aziz I. Kashef.
Water Resources Research, Vol 6, No 6, p 1729-1736, December 1970. 8 p, 2 fig, 12 ref.

Descriptors: *Groundwater movement, *Drawdown, *Unsteady flow, *Water wells, Aquifers, Water level fluctuations, Theis equation, Steady flow, Diffusivity, Porous media, Artesian wells, Mathematical studies.
Identifiers: *Multiple-well drawdown.

A method for finding the flow pattern of several wells pumped into an unconfined aquifer under transient conditions is based on the results of the study of individual wells using the relationships between the hydraulic forces. A flow equation called the 'unified well formula' is developed and written in terms of the areas of the pressure head diagrams across vertical sections. The free surface of an individual gravity well is derived in a general procedure similar to that for steady state cases but introducting time effects. The equation can be solved numerically in one iterative cycle at a given time. The results of the analysis of single wells are used to determine the flow pattern of a multiple well system under transient conditions of flow. The restricted superposition principles used in steady state cases are also used for transient flow. Dupuit's assumptions are eliminated and the circumferential velocities are neglected. The derived equations are further investigated at small radii or at large values of time. The equation of the free surface reduces to the same form as that of the corresponding steady state cases. However, the radius of influence, in the transient case, depends on the time and the diffusivity of the flow medium. (Knapp-USGS)

SIMULATION AND EVALUATION OF COMPLEX WATER SYSTEMS OPERATIONS,
Australian National Univ., Canberra.
P. A. P. Moran.
Water Resources Research, Vol 6, No 6, p 1737-1742, December 1970. 6 p, 5 ref.

Descriptors: *Statistical models, *Time series analysis, *Markov processes, Stochastic processes, Simulation analysis, Optimization, Systems analysis, Correlation analysis, Streamflow forecasting, Probability, Variability.
Identifiers: *Streamflow models.

The production of long artificial series of multiple streamflows is considered, taking into account non-normal distributions, serial dependence, seasonal variation, and the correlation between different streams. It is proposed that the distribution of flows for a given stream and month be fitted by gamma type distributions, and that these distributions then be transformed to obtain normally distributed variates. A separate canonical correlation analysis for each successive pair of months yield a nonstationary seasonally varying Markovian process that is then transformed back into the original nonnormal variates. The uses of such simulated series for calculating the probability behavior of a system of dams and for the approximate optimization of their operation is described, together with the estimation of standard errors. (Knapp-USGS)

ON TESTING THAT THE DISTRIBUTION OF EXTREMES IS OF TYPE I WHEN TYPE II IS THE ALTERNATIVE,
Agricultural Univ., Wageningen (Netherlands).
M. A. J. Van Montfort.
Journal of Hydrology, Vol 11, No 4, p 421-427, November 1970. 7 p, 1 fig, 2 tab, 2 ref.

Descriptors: *Statistical methods, *Statistics, *Mathematical studies, Probability, Sampling, Time series analysis, Data collections.
Identifiers: *Extreme value probability.

Distributions of largest extremes are normally used to estimate tail probabilities. When dealing with unlimited extremes, the question arises which type of distributions of extremes is adequate. Sometimes the Gumbel distribution (type I), which can be regarded as a restriction of the log-Gumbel distribution (type II), is used without sufficient support for this choice; estimated extreme tail probabilities can then be more influenced by the choice of the type than by the data. This paper gives a quick test with high power where type I is the null hypothesis and type II is the alternative; it is based on a study dealing with the reduction of power as a consequence of using numerically simplified tests. THE ALASKAN EARTHQUAKE, MARCH 27, 1964: LESSONS AND CONCLUSIONS,
Geological Survey, Washington, D.C.

Edwin B. Eckel.
For sale by the Superintendent of Documents, US Government Printing Office, Wash, DC 20402 - Price $0.75. Geological Survey Professional Paper 546, 1970. 57 p, 2 fig, 145 ref.

Descriptors: *Earthquakes, *Alaska, *Hydrogeology, Faults (Geology), Fractures (Geology), Floods, Landslides, Land subsidence, Seismic waves, Tsunamis, Waves (Water), Flood damage, Mudflows, Clays, Quick clays.
Identifiers: *Alaska Earthquake (1964).

One of the greatest earthquakes of all time struck south-central Alaska on March 27, 1964. In some coastal areas, local subsidence was superimposed on regional tectonic subsidence to heighten the flooding damage. Ground and surface waters were measurably affected by the earthquake, not only in Alaska but throughout the world. Much new and corroborative basic geologic and hydrologic information was accumulated in the course of the earthquake studies, and may new or improved investigative techniques were developed. Chief among these, perhaps, were the recognition that lakes can be used as giant tiltmeters, the refinement of methods for measuring land-level changes by observing displacements of barnacles and other sessile organisms, and the relating of hydrology to seismology by worldwide study of hydroseisms in surface-water bodies and in wells. The volume closes with a selected bibliography and a comprehensive index to the entire Alaska Earthquake series of U. S. Geological Survey Professional Papers 541-546. (Knapp-USGS)

ESTIMATE OF TURBULENCE AND HYDRAULIC RESISTANCES DURING WAVE MOTION IN BODIES OF WATER,
V. A. Znamenskiy.
Trans from Gosudar Gidrolog Inst-Ta, No 169, 1969. Soviet Hydrology: Selected Papers, No 4, p 364-370, 1969. 7 p, 2 fig, 3 tab, 12 ref.

Descriptors: *Turbulent flow, *Waves (Water), *Fluid friction, *Energy dissipation, *Flow resistance, Turbulence, Unsteady flow, Non-uniform flow, Steady flow, Roughness (Hydraulic), Reynolds number.
Identifiers: *Hydraulic resistance.

Studies of the kinematics and of the character of fluid motion in bodies of water show that the main losses of energy in turbulent flow and wave action occur in the bottom layer. The hydraulic resistance coefficient, characterizing energy losses, is determined through the Reynolds number and the relative thickness of the bottom layer. The energy losses and the turbulence of wave flow may be estimated from known wave elements. The relationships obtained can also be used to simulate analogous processes in the laboratory. ESTIMATION OF DESIGN FLOOD DISCHARGES ESPECIALLY FOR RIVER VALLEY PROJECT IN INDIA,
Ministry of Irrigation and Power (India); and Central Water and Power Commission, New Delhi (India).
P. Ahuja, and R. Shenoy.
In: Floods and Their Computation, Vol 1, International Association of Scientific Hydrology Publication No 84 (Unesco-WMO), p 252-258, 1969. 7 p, 1 fig.

Descriptors: *Streamflow forecasting, *Floods, *Design flood, Discharge (Water), Flood plains, Hydraulics, Dams, Bridges, Flood forecasting, Design criteria, Design flow, Peak discharge, Hydraulic design.
Identifiers: *India.

The cause and effects of floods in India are briefly outlined. The need for ensuring safety of hydraulic structures against floods in river valley projects is stressed. The criteria for the estimation of design floods for different types and categories of structures are discussed both when there is enough hydrometeorological data, and in cases when there is lack of data. Particular situations when there is a series of structures on the same river or river system are also considered. Lesser criteria adopted for hydraulic structures other than dams, such as weirs, drainage works, bridges, etc. are also discussed. Special reference has been made to railway bridges regarding which extensive basic studies are being conducted to evolve regional formulas for estimation of design floods in order to determine their waterways. (Knapp-USGS)

ON PRINCIPLES OF ESTIMATION METHODS OF MAXIMUM DISCHARGE,
State Hydrological Inst., Leningrad (USSR).
S. N. Kritsky, and M. F. Menkel.
In: Floods and Their Computation, Vol 1, International Association of Scientific Hydrology Publication No 84 (Unesco-WMO), p 29-41, 1969. 13 p, 3 fig, 21 ref.

Descriptors: *Floods, *Analytical techniques, *Estimating, *Flood forecasting, Hydrograph analysis, Discharge (Water), Peak discharge, Rainfall-runoff relationships, Storm runoff, Snowmelt, Statistical methods, Probability.
Identifiers: Flood peak estimation.

To calculate rare extreme discharge without sufficient data, additional information on maximum discharge of similar rivers may be used. Such methods are effective for rivers with moderate variations of annual maxima typical of snowmelt regimes. Theoretical curves of probability distribution can compare the performance of different rivers. Another principal estimation system is based on meteorological data as well as the variability of discharge maxima, displacement, and error of estimation of parameters of the distribution of maximum discharge probabilities. Some basic features of USSR state standardization of evaluation methods for maximum discharges are discussed. (Knapp-USGS)

DETERMINATION OF MAXIMUM POSSIBLE FLOOD FLOW USING THE UNIT HYDROGRAPH AND THE 'MAXIMUM DURATION INTENSITY' CURVE (FRENCH),
Universite Federale du Cameroun, Yaounde.
D. le Gourieres.
In: Floods and Their Computation, Vol 1, International Association of Scientific Hydrology Publication No 84 (Unesco-WMO), p 193-201, 1969. 9 p, 6 fig.

Descriptors: *Flood forecasting, *Hydrograph analysis, *Duration curves, Hyetographs, Unit hydrographs, Rainfall-runoff relationships, Probable maximum precipitation, Infiltration, Groundwater movement, Discharge (Water), Peak discharge.
Identifiers: Maximum discharge prediction.

Determining maximum flood discharges on the basis of the unit hydrograph and the rainfall intensity duration curve for the region of the river basin is discussed. For this purpose it is sufficient to plot the 'ranked' unit hydrograph and the 'ranked' hyetogram of the most 'dangerous' storm. Then the corresponding ordinates of the ranked unit hydrograph are multiplied by the ranked hyetogram ordinates. The area contained between the runoff curve and the X-axis represents the possible maximum discharge. In order to derive the probable maximum flood discharge it is sufficient to add the maximum groundwater discharge. (Knapp-USGS)

FLOOD HYDROLOGY OF SMALL WATERSHEDS--EVALUATION OF TIME PARAMETERS AND DETERMINATION OF PEAK DISCHARGE,
Hawaii Univ., Honolulu. Dept. of Agricultural Engineering.
I-pai Wu.
Hawaii University Water Resources Research Center Contribution No 13, Project Completion Report, December 1968. 33 p, 11 fig, 2 tab, 19 ref. OWRR Project B-006-HI (1).

Descriptors: *Rainfall-runoff relationships, *Urbanization, *Floods, *Hawaii, *Peak discharge, Hydrograph analysis, Regression analysis, Recession curves, Flood routing, Rational formula, Small watersheds, Time of concentration, Precipitation intensity.
Identifiers: *Flood hydrology, *Oahu (Hawaii).

Hawaiian small watersheds are short and steep. Both of the two hydrograph time parameters, time to peak and recession constant, are short. The shape of the flood hydrograph is a steep triangle and most likely produced by a short duration, high intensity rainfall. Peak discharge equations which are derived by three different approaches, triangular hydrograph, instantaneous unit hydrograph, and overland flow analysis, can all be shown as a simple linear equation. A linearity test between peak discharge and runoff has been made for the small watersheds and a good linear relationship was found between peak discharge and for runoff less than 6 inches. SPECTRAL MEASUREMENTS AND GROWTH RATES OF WIND-GENERATED WATER WAVES,
Stanford Univ., Calif. Dept. of Civil Engineering.
Alex J. Sutherland.
Stanford University Department of Civil Engineering Technical Report No 84, August 1967. 64 p, 19 fig, 9 tab, 23 ref. ONR Contract Nonr-225 (71), and NSF Grant GK-736.

Descriptors: *Waves (Water), *Winds, *Hydraulic models, *Frequency analysis, Frequency, Wind velocity, Wavelengths.
Identifiers: *Wind-generated water waves, *Wave tanks, Water wave spectra.

Power spectral density measurements were made of the water surface displacement in a wind-generated wave train. Growth rates of different

vave components were determined from the measured spectra. The resulting values were compared with those predicted by the viscous Reynolds stress mechanism of energy transfer from wind to wave. Where the growth was exponential the theory could be made to predict growth rates successfully at wave numbers less than 15.0 per ft. At higher wave numbers the theory predicted values an order of magnitude larger than those measured. Limited regions of linear growth were found at the lowest wind speed for low frequency components. The scatter in the data did not permit a quantitative comparison with theory to be made for this range. No equilibrium range was found. (Knapp-USGS)

THE EFFECT OF RAINFALL ON THE MECHANICS OF STEADY SPATIALLY VARIED SHEET FLOW ON A HYDRAULICALLY SMOOTH BOUNDARY,
Illinois Univ., Urbana. Dept. of Civil Engineering.
Yong Nam Yoon.
PhD Thesis, Illinois University, 1970. 187 p, 71 fig, 1 tab, 66 ref, 5 append. OWRR Project B-018-ILL (2).

Descriptors: *Rainfall-runoff relationships, *Overland flow, *Hydraulic models, *Sheet flow, Mathematical models, Equations, Rainfall intensity, Boundaries (Surfaces), Runoff, Flow resistance, Channel morphology, Topography, Reynolds number, Flow rates, Steady flow, Turbulent flow, Shear stress, Spatial distribution, Demonstration watersheds, Simulated rainfall.
Identifiers: *Experimental watersheds.

The effect of rainfall intensity, Reynolds number and channel slope on the point mean velocity distribution over the vertical, momentum coefficient, longitudinal relative turbulence intensity profile and local mean boundary shear stress is studied. The local mean boundary shear stress was obtained by two methods: the numerical solution of one-dimensional steady spatially varied flow equation with the water surface profile measured; and by direct measurement using a hot-film sensor. These methods are compared and the validity of a one-dimensional equation is discussed. The law of resistance is also established using correlation analysis and experimental results. The Reynolds number and rainfall intensity are found to be the most significant parameters governing the flow resistance. Mathematical models for the description of the upper and lower portion of a velocity profile are developed and compared with experimental measurements. It was concluded that Reynolds number and rainfall intensity are the most important parameters affecting the boundary shear stress. (Woodard-USGS)

SOLUTION OF THE UNSTEADY FLOW EQUATIONS AND ITS USE IN MODELING THE SURFACE RUNOFF PROCESS,
Utah Water Research Lab., Logan.
Roger A. Amisial, J. Paul Riley, Kenneth G. Bennard, and Eugene K. Israelsen.
Research Project Progress Report to Soil and Water Conservation Research Division, Agricultural Research Service, United States Department of Agriculture, May 1969. 66 p, 12 tab, 46 fig, 52 ref.

Descriptors: *Surface runoff, *Hydrologic models, Simulation, *Analog computers, Infiltration, *Runoff, Rainfall, Watershed (Basins), Precipitation, Convective storms, Water yields, Water yield improvement, Hydrologic relationships, Hydrologic data, Water resources development, Planning.

The flow of water on a watershed is usually unsteady and spatially varied, but can be adequately portrayed by the equations of momentum and continuity, commonly referred to as the unsteady flow equations. Because these equations are quasi-linear, hyperbolic, partial differential equations, they are not easily amenable to solution. Analog computer models of surface runoff generally have been based on simplified forms of these equations. As an improvement of those models, an analog computer solution is presented here for the unsteady flow equations. The solution involves the conversion of the partial differential equations into a differential-difference system, and a consideration of the stability of the difference approach was performed. The analog computer solution is then used to develop a model of surface runoff generated from rainfall on a watershed. Spatial distribution of the watershed parameters is accounted for by dividing the drainage basin into a number of subzones according to its physiography and the rainfall input was made to each subzone. Both the overland and channel flow components are considered in the surface runoff process. Preliminary testing and verification of the model have been made by simulating two runoff events on a subwatershed of the Walnut Gulch experimental watershed near Tombstone, Arizona. CROSS-SPECTRUM ANALYSIS OF GROUNDWATER LEVELS IN AN ESKER,
Stockholm Univ. (Sweden). International Meteorological Inst.
Erik Eriksson.
Nordic Hydrology, Vol 1, No 4, p 245-259, 1970. 15 p, 13 fig, 2 tab, 2 ref.

Descriptors: *Water level fluctuations, *Surface-groundwater relationships, *Time series analysis, Glacial drift, Statistical methods, Frequency analysis, Streamflow forecasting, Water levels, Aquifers, Regression analysis.
Identifiers: *Cross-spectral analysis, Sweden.

A study of 30-year records of precipitation, river water stage, and groundwater levels in the esker area south of Uppsala, Sweden used cross-spectrum analysis to summarize data in coherence graphs for frequencies up to 18 cycles/year and tables of phase shifts for selected frequencies. The coherence between precipitation and the other variables is extremely weak or absent. The river water level and groundwater levels show appreciable coherence relatively independent of frequency, suggesting that variation in groundwater levels runs parallel to variations in river water stage. The coherence between groundwater levels, however, is such that interaction is suggested. The phase shift between river water level and groundwater level is approximately 10-30 days with the groundwater levels lagging. The magnitude of phase shift seems to depend on the distance between ground surface and groundwater level. (Knapp-USGS)

THEORY OF GROUNDWATER FLOW,
Technische Hogeschool, Delft (Netherlands).
A. Verruijt.
New York, Macmillan and Company, 1970. 190 p.

Descriptors: *Groundwater movement, *Soil water movement, Analytical techniques, Seepage, Darcys law, Dupuit-Forchheimer theory, Computer programs, Analog models, Permeability, Viscosity, Flow, Porous media, Aquifers, Model studies.
Identifiers: Finite element method, Textbooks.

The aim of this book is to present the fundamentals of the theory of groundwater flow and the most effective methods for solving groundwater flow problems occurring in practice. Technical and practical aspects are not discussed. Although the book is in principle intended to be an introductory text, some theoretically rather complicated methods, notably the complex variable method, analog methods, and the finite element are included. Among the problems discussed are those connected with seepage through earth dams, underneath hydraulic structures and problems related to the supply of drinking water. In general the problem is to determine the velocity and the pressure of the water in the interior of a soil mass with given boundaries, under certain imposed conditions along these boundaries. Mathematically speaking, the problem is in the class of boundary-value problems. (Knapp-USGS)

NON-DARCY FLOW IN THE VICINITY OF WELLS,
New South Wales Univ., Kensington (Australia). School of Civil Engineering.
C. R. Dudgeon, and C. N. Au Au Yeung.
In: Proceedings of Groundwater Symposium, New South Wales University, Manly Vale, Australia, August 28-29, 1969: New South Wales University Water Research Laboratory Report No 113, Paper No 2, p 13-27, April 1970. 15 p, 6 fig, 14 ref.

Descriptors: *Groundwater movement, *Darcys law, *Dupuit-Forchheimer theory, *Head loss, Hydrodynamics, Flow nets, Turbucent flow, Hydraulic conductivity, Mathematical studies, Permeability, Drawdown, Velocity, Water yield.
Identifiers: *Australia, Finite difference method.

The velocity-hydraulic gradient relationships which are applicable to non-Darcy flow in the vicinity of

wells and their application in determining flow rates and drawdowns are described. Methods available for computing non-Darcy flow nets are discussed and practical difficulties involved in determining the constants in the head loss equation are considered. Determination of drawdowns in wells where non-Darcy flow occurs required the computation of nonlinear flow nets. This may be done on the digital computer using finite difference or finite element methods. Accurate knowledge of the type of material and state of compaction of aquifer and gravel pack materials close to the well is required for the constants in the head loss equation to be accurately determined. The only reliable way at present of determining the constants in the head loss equation is by carrying out permeameter tests. The effect of convergence of the flow on the constants required close attention. (See also W71-03401) (Knapp-USGS)

ON SUBSIDENCE OF LOESS SOILS OF THE UKRAINE,
Akademiya Nauk URSR, Kiev. Instytut Geologichnykh Nauk.
V. F. Krayev.
In: Proceedings of the Tokyo Symposium on Land Subsidence, Vol 1, International Association of Scientific Hydrology and UNESCO, September 1969, Tokyo, p 321-324, 1970. 4 p.

Descriptors: *Subsidence, *Withdrawal, *Land subsidence, Aquifers, Water levels, Water table, Water balance, Surface-groundwater relationships, Seepage, Infiltration, Compaction, Damages, Groundwater, Groundwater movement, Mining, Pumping, Soil mechanics, Rock mechanics, Water wells.

About 14% of the territory of the USSR and nearly 65% of the Ukraine are covered with loess. Loess has several specific compositional features (predominence of dust fractions, presence of carbonates, poor weathering of the clastogenc material) as well as specific properties (fast loosening, rather high filtration rate, anisotropy of the mechanical properties in vertical and horizontal directions), which cause subsidence. Subsidence is among the most adverse features of loess soils. Experience in the construction and operation of buildings on loess soils furnishes numerous examples of deformation suffered by buildings, industrial installations, and irrigation canals. In several areas of the Ukraine subsidence may be as great as 1.0 to 1.5 meters, with thickness of the loess averaging 20 to 40 meters. Subsidence results both from soaking of the soils from the top and from rise in the groundwater level following flooding of reservoirs. The physical nature of the phenomenon consists in a highly perceptible process of compaction of otherwise insufficiently compact portions of the loess complex due to disintegration of a greater part of structural bonds in the soil by water (or other liquids), which may be both natural or supplemented by the construction weight. (See also W71-03148) (Knapp-USGS)

CONSIDERATION ABOUT THE COMPACTION MECHANISM OF STRATUM LYING AT THE DEEPER HORIZON IN TOKYO LOWLAND,
Hirosaki Univ. (Japan). Dept. of Pedagogics.
Tetsuro Shiobara.
In: Proceedings of the Tokyo Symposium on Land Subsidence, Vol 1, International Association of Scientific Hydrology and UNESCO, September 1969, Tokyo, p 315-321, 1970. 7 p, 3 fig.

Descriptors: *Subsidence, *Withdrawal, *Land subsidence, Aquifers, Water levels, Water table, Water balance, Surface-groundwater relationships, Seepage, Infiltration, Compaction, Damages, Groundwater, Groundwater movement, Pumping, Soil mechanics, Rock mechanics, Water wells, Hydrogeology, Clays, Aquicludes.
Identifiers: *Tokyo (Japan).

A concept of 'Detour Traveling' is introduced to describe behavior of groundwater and intergranular water within pores of semi-pervious strata or aquicludes undergoing compaction. The Quaternary sediments in the Tokyo Lowland, especially the sediments at deeper horizon, are heterogeneous and frequently discontinuous, and the situation strongly regulates the 'Detour Traveling' effect. The deeper strata account for the greater part of the compaction. The change of groundwater pressure causes ground subsidence. It may be attributed to the compaction of a loose clayey material and to 'Detour Traveling' which expresses the effect of the water flow from the strata and the pressure propagation through the extending 'Arterial Network' of more porous materials. SOME PROBLEMS OF TIME-SOIL COMPACTION IN PUMPING LIQUID FROM A BED,
All-Union Scientific Research Inst. of Hydrogeology and Engineering Geology, Moscow (USSR).
Z. G. Ter-Martirosyan, and V. I. Ferronsky.
In: Proceedings of the Tokyo Symposium on Land Subsidence, Vol 1, International Association of Scientific Hydrology and UNESCO, September 1969, Tokyo, p 303-314, 1970. 12 p, 4 fig, 14 ref.

Descriptors: *Subsidence, *Withdrawal, *Land subsidence, Aquifers, Water levels, Water table, Water balance, Surface-groundwater relationships, Seepage, Infiltration, Compaction, Damages, Groundwater, Groundwater movement, Mining, Pumping, Soil mechanics, Rock mechanics, Water wells, Mathematical studies, Hydrogeology.
Identifiers: *USSR.

One-dimensional and plane axi-symmetrical problems of bed consolidation affected by the weight of overlying formations with different schemes of pumping are solved for the most general case when the bed from which a liquid (oil, water) is pumped is a deformed elastic-creeping porous medium filled with a compressible liquid. The mixture of liquid and gas is taken as a compressible liquid. Soil compaction due to the formation of a cone of depression is also discussed. (See also W71-03148) (Knapp-USGS)
W71-03408

LAND SUBSIDENCE, EARTH FISSURES AND GROUNDWATER WITHDRAWAL IN SOUTH CENTRAL ARIZONA, U.S.A.,
Geological Survey, Phoenix, Ariz.; and Geological Survey, Sacramento, Calif.
H. H. Schumann, and J. F. Poland.
In: Proceedings of the Tokyo Symposium on Land Subsidence, Vol 1, International Association of Scientific Hydrology and UNESCO, September 1969, Tokyo, p 295-302, 1970. 8 p, 5 fig, 9 ref.

Descriptors: *Subsidence, *Withdrawal, *Land subsidence, Aquifers, Water levels, Water table, Water balance, Surface-groundwater relationships, Seepage, Infiltration, Compaction, Damages, Groundwater, Groundwater movement, Pumping, Soil mechanics, Rock mechanics, Water wells, Hydrogeology, Arizona.
Identifiers: *Pinal County (Ariz).

Land subsidence in western Pinal County, south central Arizona, is related to groundwater withdrawal and resultant water level declines. Differential subsidence and earth fissures have damaged irrigation systems, interstate highways and railroads; and have necessitated rerouting of a proposed aqueduct. Subsidence was first detected in 1948. The maximum documented subsidence from 1948 to 1967 is 2.30 meters. Large-scale pumping for irrigation from wells that penetrate as much as 700 meters of permeable sediments has lowered water levels as much as 61 meters. Net water-level declines correspond with subsidence and water-level fluctuations correlate with sediment compaction and expansion. Measured compaction, 1965-1967, in the upper 253 meters accounts for only 65 percent of measured subsidence. Numerous earth fissures, as much as 12.8 kilometers long, occur in the alluvium and transect natural drainageways. Some of the fissures appear on the periphery of the subsiding areas and may be tensional breaks. (See also W71-03148) (Knapp-USGS)

LAND SUBSIDENCE AND AQUIFER-SYSTEM COMPACTION, SANTA CLARA VALLEY, CALIFORNIA, USA,
Geological Survey, Sacramento, Calif.
J. F. Poland.
In: Proceedings of the Tokyo Symposium on Land Subsidence, Vol 1, International Association of Scientific Hydrology and UNESCO, September 1969, Tokyo, p 285-294, 1970. 10 p, 5 fig, 10 ref.

Descriptors: *Subsidence, *Withdrawal, *Land subsidence, Aquifers, Water levels, Water table, Water balance, Surface-groundwater relationships, Seepage, Infiltration, Compaction, Damages, Groundwater, Groundwater movement, Pumping, Soil mechanics, Rock mechanics, Water wells, Hydrogeology, Confined water, California.
Identifiers: *Santa Clara Valley (Calif).

Intensive withdrawal of groundwater from the confined aquifer system 240 m thick, in the San Jose area of Santa Clara Valley, California, has drawn down the artesian head as much as 75 m since 1912. Resulting land subsidence, which began about 1915, was 3.9 m in 1967. Periodic releveling of bench marks, core-hole data, and continuous measurements of water-level change and aquifer system compaction furnish quantitative evidence on the response of the system to change in applied stress. The adjusted subsidence-head decline ratio in San Jose for 1920-38 was about 1:10. This ratio can be utilized to estimate ultimate subsidence from subsequent head declines. Compaction records at some sites define the magnitude of excess pore pressures in aquitards; at one site, increasing artesian head by 14 m should stop the subsidence. FIELD MEASUREMENT OF AQUIFER-SYSTEM COMPACTION, SAN JOAQUIN VALLEY, CALIFORNIA, USA,
Geological Survey, Sacramento, Calif.
Ben E. Lofgren.

n: Proceedings of the Tokyo Symposium on Land Subsidence, Vol 1, International Association of Scientific Hydrology and UNESCO, September 1969, Tokyo, p 272-284, 1970. 13 p, 11 fig, 4 ref.

Descriptors: *Subsidence, *Withdrawal, *Land subsidence, Aquifers, Water levels, Water table, Water balance, Surface-groundwater relationships, Seepage, Infiltration, Compaction, Damages, Groundwater, Groundwater movement, Pumping, Soil mechanics, Rock mechanics, Water wells, Hydrogeology, Surveys, California.
Identifiers: *San Joaquin Valley (Calif).

Two types of field measurements have been successfully used to monitor aquifer-system compaction and accompanying land subsidence in California: (1) periodic releveling of a network of surface bench marks, referenced to distant stable bedrock, and (2) continuous recording of vertical shortening of the water-bearing deposits, using extensometers installed in cased wells at selected locations. The compacting deposits of the aquifer system are readily compressible and sensitive to change in overburden stress. Imposed hydraulic stresses, caused by the extracting of fluids, results in immediate strain in the aquifer system. Both elastic compression and inelastic rearrangement of the intergranular structure are caused by a stress increase; however, the elastic expansion during a stress decrease is small compared to ultimate plastic compaction for a comparable stress increase. The subsidence/stress-change ratio ranges from 0.005 to 0.10 feet of subsidence per foot of hydraulic stress change durig the first prolonged cycle of water-level decline. W71-03411

ON THE VARIATION OF ARTESIAN HEAD AND LAND-SURFACE SUBSIDENCE DUE TO GROUNDWATER WITHDRAWAL,
Saitama Univ., Urawa (Japan).
Shauzo Komaki.
In: Proceedings of the Tokyo Symposium on Land Subsidence, Vol 1, International Association of Scientific Hydrology and UNESCO, September 1969, Tokyo, p 256-271, 1970. 16 p, 19 fig, 5 ref.

Descriptors: *Subsidence, *Withdrawal, *Land subsidence, Aquifers, Water levels, Water table, Water balance, Surface-groundwater relationships, Seepage, Infiltration, Compaction, Damages, Groundwater, Groundwater movement, Mining, Pumping, Soil mechanics, Rock mechanics, Water wells.
Identifiers: *Yokkaichi (Japan).

In and near Yokkaichi, Japan observation of artesian head and subsidence has been carried out since August 1963. The secular variation of groundwater and land-surface levels is disturbed by oceanic tides, meteorological effects and other factors with periods of about one day or less. In order to obtain the secular variation, these disturbances were eliminated from observed data by Pertzev's method. Secular variation of both the groundwater and the land-surface levels is subject to the influence of groundwater withdrawal. The effective amount of discharge Q was calculated by means of the Theis recovery method. There is a good correlation between Q of one day and the secular value of the groundwater level at 06.00 hours of each following day. There is also a good correlation between Q and the amount of expansion-compaction. (See also W71-03148) (Knapp-USGS)
W71-03412

SOME PROBLEMS AND RESULTS OF LABORATORY AND FIELD INVESTIGATIONS INTO ROCK MOVEMENTS CAUSED BY WATER MIGRATION IN LOOSE GRANULAR GROUNDS IN HUNGARY,
Hungarian Mining Research Inst., Budapest.
Zs. Kesseru.
In: Proceedings of the Tokyo Symposium on Land Subsidence, Vol 1, International Association of Scientific Hydrology and UNESCO, September 1969, Tokyo, p 249-255, 1970. 7 p, 2 fig, 8 ref.

Descriptors: *Subsidence, *Withdrawal, *Land subsidence, *Mining, Aquifers, Water levels, Water table, Water balance, Surface-groundwater relationships, Seepage, Infiltration, Compaction, Damages, Groundwater, Groundwater movement, Pumping, Soil mechanics, Rock mechanics, Water wells, Analog models, Hydrogeology.
Identifiers: *Hungary.

Some observations are presented on the effect of water migration in loose granular rocks upon the compaction of aquifers based upon recent theoretical research work performed in Hungary. Measuring and estimating rock movements caused by pore water pressure drop in the vicinity of Gyongyosvisonta open pit mine were used for forecasting rock movement in the neighborhood of a thermal power-station and determining the constants necessary for calculating the reduction in porosity caused by secondary consolidation. Laboratory experiments were used for investigating rock movements caused by water migration in loose granular sedimentary rocks. Magnetic photoelastic analog modeling and triaxial filter cells were used for investigating the basic phenomena of rock equilibrium. (See also W71-03148) (Knapp-USGS)
W71-03413

INFLUENCE OF SUBSIDENCE ON BOTH SURFACE AND UNDERGROUND HYDROLOGY (FRENCH),
Ghent Rijksuniversiteit (Belgium).
L. J. Tison.
In: Proceedings of the Tokyo Symposium on Land Subsidence, Vol 1, International Association of Scientific Hydrology and UNESCO, September 1969, Tokyo, p 242-249, 1970. 8 p, 6 fig.

Descriptors: *Subsidence, *Withdrawal, *Land subsidence, Aquifers, Water levels, Water table, Water balance, Surface-groundwater relationships, Seepage, Infiltration, Compaction, Damages, Groundwater, Groundwater movement, Pumping, Soil mechanics, Rock mechanics, Water wells.
Identifiers: *Land subsidence-streamflow relationships.

The influence of land subsidence on a river is discussed. The discharge of a river usually does not change under the influence of land subsidence. The theorem of the 'surface slope' shows that the absolute water levels are reduced in the zone of subsidence and upstream. However, the reduction of the absolute water level in the zone of subsidence is smaller than the amount of the subsidence and there is therefore a relative rising of the water level. In the case of floods, it is shown that the discharge of the river increases under the influence of subsidence with the following consequences: increase of the water level in the region of subsidence; increase of the absolute water levels downstream of the subsidence but decrease upstream. Debris and silt have more opportunity to deposit in the region of the subsidence. (See also W71-03148) (Knapp-USGS)
W71-03414

GEOLOGICAL AND GEOHYDROLOGICAL PROPERTIES OF THE LAND SUBSIDED AREAS-CASE OF THE NIIGATA LOW LAND,
Ministry of Agriculture and Forestry, Niigata (Japan). Hokuriku Regional Office.
S. Takeuchi, S. Kimoto, M. Wada, H. Shiina, and K. Mukai.
In: Proceedings of the Tokyo Symposium on Land Subsidence, Vol 1, International Association of Scientific Hydrology and UNESCO, September 1969, Tokyo, p 232-241, 1970. 10 p, 10 fig, 1 tab, 5 ref.

Descriptors: *Subsidence, *Withdrawal, *Land subsidence, Aquifers, Water levels, Water table, Water balance, Surface-groundwater relationships, Seepage, Infiltration, Compaction, Damages, Groundwater, Groundwater movement, Pumping, Soil mechanics, Rock mechanics, Water wells, Radioactive dating, Hydrogeology.
Identifiers: Niigata (Japan).

To trace the origin of the land subsidence in the low-land area in Niigata Prefecture, Japan, geological and geohydrological properties of the subsided area were studied. The tests used included micropaleontological analysis, absolute chronology by the radiocarbon method, tritium dating, penetration tests, and exploratory boring. The land subsidence had a close relationship with the chronology and depositional environment of alluvium, and the groundwater was rather old. Land subsidence can be calculated in terms of hydraulic balance of groundwater. (See also W71-03148) (Knapp-USGS)
W71-03415

WATER BALANCE INVESTIGATION BASED UPON MEASUREMENTS OF LAND SUBSIDENCE CAUSED BY GROUNDWATER WITHDRAWAL,
District Water Authority, Pecs (Hungary).
I. Orloci.
In: Proceedings of the Tokyo Symposium on Land Subsidence, Vol 1, International Association of Scientific Hydrology and UNESCO, September 1969, Tokyo, p 224-232, 1970. 9 p, 5 fig.

Descriptors: *Subsidence, *Withdrawal, *Land subsidence, Aquifers, Water levels, Water table, Water balance, Surface-groundwater relationships, Seepage, Infiltration, Compaction, Damages, Groundwater, Groundwater movement, Pumping, Soil mechanics, Rock mechanics, Water wells, Hydrogeology, Porosity.
Identifiers: *Debrecen (Hungary).

The total water demand of Debrecen, Hungary is supplied from wells tapping a 20-30 m thick coarse sand aquifer of the lower Quaternary at 100-200 m depth. The aquifer is overlain by a fluvial series topped by loess and sand. The first wells were drilled some 70 years ago. The yearly water withdrawal now exceeds 12 million cu m. The piezometric level of this aquifer in the vicinity of the wells has subsided 15-20 m since 1913. Because of water withdrawal, the alluvial layer consolidates and the land subsides. Town survey data are used to compare old and recent measurements. A consolidation data series extending over about 40 years was obtained. The maximum subsidence of land amounts to over 40 mm since 1927. The water balance of the aquifer can be characterized by parameters of the compaction and of the dynamic resource determined by land subsidence data. The maximum degree of compaction (which is equal to the pore volume variation produced by possible consolidation) can be estimated at 4-5% of the pore volume of the layer. (See also W71-03148) (Knapp-USGS)
W71-03416

SIMULATION OF GROUNDWATER BALANCE AS A BASIS OF CONSIDERING LAND SUBSIDENCE IN THE KOTO DELTA, TOKYO,
Tokyo Univ. (Japan). Faculty of Science.
Soki Yamamoto, Isamu Kayane, Shigeru Aoki, and Seietsu Fuji.
In: Proceedings of the Tokyo Symposium on Land Subsidence, Vol 1, International Association of Scientific Hydrology and UNESCO, September 1969, Tokyo, p 215-224, 1970. 10 p, 4 fig, 2 tab, 7 ref.

Descriptors: *Subsidence, *Withdrawal, *Land subsidence, *Mathematical models, Aquifers, Water levels, Water table, Water balance, Surface-groundwater relationships, Seepage, Infiltration, Compaction, Damages, Groundwater, Groundwater movement, Pumping, Soil mechanics, Rock mechanics, Water wells, Hydrogeology, Model studies, Computer programs.
Identifiers: *Tokyo (Japan), *Koto Delta (Japan).

The major cause of land subsidence in the Koto Delta area, Tokyo is believed to be the heavy withdrawal of groundwater. The rate of subsidence is generally in accord with the rate of change in piezometric surface. To simulate the secular trend of groundwater levels, a two-dimensional diffusion

model of a groundwater basin was adopted. Extraction data and water level histories were collected for the delta area and coefficients of storage and transmissibility were determined by the method of least squares using a digital computer. Most of the pumped groundwater in this area has been supplied not from the recharged groundwater but from that stored in the aquifer. (See also W71-03148) (Knapp-USGS)
W71-03417

GROUND SINKING IN SHIROISHI PLAIN, SAGA PREFECTURE,
Ministry of Agriculture and Forestry, Tokyo (Japan). Kanto Regional Office.
Hisao Kumai, Mitsuo Sayama, Tatsuo Sibasaki, and Kazuharu Uno.
In: Proceedings of the Tokyo Symposium on Land Subsidence, Vol 2, International Association of Scientific Hydrology and UNESCO, September 1969, Tokyo, p 645-657, 1970. 13 p, 10 fig, 6 ref.

Descriptors: *Subsidence, *Withdrawal, *Land subsidence, Aquifers, Water levels, Water table, Water balance, Surface-groundwater relationships, Seepage, Infiltration, Compaction, Damages, Groundwater, Groundwater movement, Pumping, Soil mechanics, Rock mechanics, Water wells.
Identifiers: *Japan.

Shiroishi Plain, Japan, is a deltaic plain of about 8 sq km on the Ariake sea. More than 150 deep wells which have been drilled since 1939 can supply water for irrigation. Wells have a depth ranging from 100-200 m and lift confined groundwater in deposits consisting of complex interfingered silt and gravel beds. The groundwater level declined very fast, and intrusion of saline water and ground sinking occurred. Zonal subsidence was found in this area in 1958 and occurred by the consolidation of alluvial clay. The sinking was found in the whole area of the plain in 1961. Sinking is about 20 cm/year maximum. It is directly proportional to the thickness of alluvial clay and volume of water withdrawn for irrigation. (See also W71-03148) (Knapp-USGS)
W71-03418

EXPERIMENTS ON WATER INJECTION IN THE NIIGATA GAS FIELD,
Geological Survey of Japan, Tokyo.
Yasufumi Ishiwada.
In: Proceedings of the Tokyo Symposium on Land Subsidence, Vol 2, International Association of Scientific Hydrology and UNESCO, September 1969, Tokyo, p 629-634, 1970. 6 p, 3 fig.

Descriptors: *Withdrawal, *Natural gas, *Injection wells, *Secondary recovery (Oil), *Land subsidence, Aquifers, Water levels, Water table, Water balance, Surface-groundwater relationships, Seepage, Infiltration, Compaction, Damages, Groundwater, Groundwater movement, Pumping, Soil mechanics, Rock mechanics, Water wells.
Identifiers: *Niigata gas field (Japan).

Experiments using water injection in the natural gas reservoirs of 'dissolved-in-water type' (confined aquifers with dissolved methane gas) were carried out in Niigata City, Japan from 1960 to 1963. The purpose was to study field practice of water injection aimed at the maintenance of the reservoir pressures. Both degassed formation water drained from a gas-water separator and surface water taken from a river were used for injection fluids. Permeability of the main reservoirs ranges from 10 to 50 darcys. Injectivity index is, in general, less than a quarter of productivity index. Back-washing at adequate time intervals is necessary to continue long-term injection. (See also W71-03148) (Knapp-USGS)
W71-03419

PREDICTION OF FUTURE SUBSIDENCE ALONG DELTA-MENDOTA AND SAN LUIS CANALS, WESTERN SAN JOAQUIN VALLEY, CALIFORNIA,
Bureau of Reclamation, Sacramento, Calif.
N. Prokopovich.
In: Proceedings of the Tokyo Symposium on Land Subsidence, Vol 2, International Association of Scientific Hydrology and UNESCO, September 1969, Tokyo, p 600-610, 1970. 11 p, 10 fig, 12 ref.

Descriptors: *Subsidence, *Withdrawal, *Land subsidence, Aquifers, Water levels, Water table, Water balance, Surface-groundwater relationships, Seepage, Infiltration, Compaction, Damages, Groundwater, Groundwater movement, Pumping, Soil mechanics, Rock mechanics, Water wells.
Identifiers: *Delta-Mendota Canal (Calif), *San Luis Canals (Calif), *San Joaquin Valley (Calif).

About 120 miles of the Delta-Mendota and San Luis Canals, California have been affected by subsidence caused by overdraft of groundwater. From 1905 to 1951 piezometric groundwater levels along the alignment declined up to 200 feet. Canal deliveries stopped the overdraft, but continuing readjustment of pore pressures caused some 'residual subsidence' to continue at gradually diminishing rates. The subsidence has affected the downstream 35-40 miles of the canal, locally exceeding 6 feet from 1953 to 1966. Estimates of ultimate future subsidence, varying from traces to 3.6 feet, were derived from bench mark data treated as an exponential decay function. About 80 miles of the San Luis Canal, constructed in 1963-67, are subsiding due to groundwater overdraft. From 1905 to 1962, piezometric levels along the alignment declined up to 470 feet, causing up to 18 feet of subsidence. Hydrocompaction of low-density sediments above the water table occurs in two portions of the San Luis Canal. The phenomena may be related to freezing swelling and following freeze-drying of Pleistocene mudflows. Ultimate amounts of hydrocompaction ranging from traces to 20 feet were calculated from average dry densities of sediments and 'ultimate' density values obtained in a few long-flooded areas. W71-03420

AN EXAMPLE OF GROUND SUBSIDENCE ESTIMATION,
Public Works Research Inst., Tokyo (Japan).
Masami Fukuoka.
In: Proceedings of the Tokyo Symposium on Land Subsidence, Vol 2, International Association of Scientific Hydrology and UNESCO, September 1969, Tokyo, p 595-599, 1970. 5 p, 3 fig, 1 tab.

Descriptors: *Subsidence, *Withdrawal, *Land subsidence, Aquifers, Water levels, Water table, Water balance, Surface-groundwater relationships, Seepage, Infiltration, Compaction, Damages, Groundwater, Groundwater movement, Pumping, Soil mechanics, Rock mechanics, Water wells.
Identifiers: *Tokyo (Japan).

The Koto delta area of the Tokyo Metropolis is a low alluvial land extending for about 5 km from east to west, about 10 km from south to north, with an area of approximately 40 sq km bordered by the River Sumida on the west, and by the Arakawa canal on the east. An external embankment was planned for the purpose of defending this area from floodtide. Before carrying out this undertaking, the estimation of future sinking was necessary. Data available for the estimation were not sufficient. Accordingly, sinking for about 20 years after 1955 was estimated. The estimated amount of sinking was based on the following assumptions: (1) As an initial condition, the water level in the permeable sublayer in the alluvial layer and that in the middle permeable sublayer in the tertiary layer coincide; (2) All of the material in the compacted sublayer in the Alluvium is consolidated clay; (3) As the result of excessive pumping of underground water from the middle permeable stratum in the tertiary layer, the ground sank because of consolidation in the middle clayey sublayer in the Alluvium as well as in the middle permeable stratum of the tertiary layer located at depths of up to 80 m; (4) Where t water level in the middle permeable stratum f below the lower face of the alluvial layer, a mospheric pressure was effective between t lower face of alluvial layer and the water tab Because the void ratio, unit weight, compressi index and coefficient of consolidation before t ground subsidence were not available, the soil co stants acquired by testing of samples obtained fro cores were used without adjustment. ANALYTICAL METHODS FOR PREDICTIN SUBSIDENCE,
Woodward-Clyde-Sherard and Associat Oakland, Calif.
Keshavan Nair.
In: Proceedings of the Tokyo Symposium on La Subsidence, Vol 2, International Association Scientific Hydrology and UNESCO, Septemb 1969, Tokyo, p 588-595, 1970. 8 p, 3 fig, 20 ref.

Descriptors: *Numerical analysis, *Subsiden *Land subsidence, *Mining, Mathematical studi Compaction, Damages, Groundwater, Grour water movement, Soil mechanics, Rock mechani Water wells.
Identifiers: *Finite element analysis.

The finite element technique is considered to the most useful technique for application to su sidence problems. This paper deals solely with t problem of subsidence which is a consequence the creation of underground openings. Analyti methods based on the principles of solid mechan and placed within the framework of a good u derstanding of the physical nature of the probl have proved to be the most useful means developing predictive techniques for engineeri problems. The major variables that have to be cluded in formulating a problem for investigati subsidence are: (1) location of the undergrou opening; (2) shape of the opening; (3) the ro profile and geologic conditions; (4) the propert of the rock mass surrounding the opening, and (the initial state of stress in the rock. WATER PERMEABILITY AND PLAST INDEX OF SOILS,
Kanazawa Univ. (Japan). Dept. of Engineering.

Yoshichika Nishida, and Seishi Nakagawa.
In: Proceedings of the Tokyo Symposium on Land Subsidence, Vol 2, International Association of Scientific Hydrology and UNESCO, September 1969, Tokyo, p 573-578, 1970. 6 p, 3 fig, 1 tab.

Descriptors: *Permeability, *Plasticity, Clays, *Rheology, *Subsidence, Aquifers, Seepage, Infiltration, Compaction, Groundwater, Groundwater movement, Soil mechanics, Rock mechanics, Water wells, Plasticity index.
Identifiers: *Permeability (Clays).

The coefficient of permeability of water in clay, on which the rate of consolidation settlement is dependent, can be approximately calculated from its void ratio and plastic index through a simple formula. A linear relationship was experimentally determined relating void ratio of a clay and the logarithmic value of its coefficient of permeability. (See also W71-03148) (Knapp-USGS)
W71-03424

RELATIONSHIP OF CONSOLIDATION CHARACTERISTICS AND ATTERBERG LIMITS FOR SUBSIDING SEDIMENTS IN CENTRAL CALIFORNIA, U.S.A.,
Geological Survey, Denver, Colo. Water Resources Div.
A. I. Johnson, and R. P. Moston.
In: Proceedings of the Tokyo Symposium on Land Subsidence, Vol 2, International Association of Scientific Hydrology and UNESCO, September 1969, Tokyo, p 579-587, 1970. 9 p, 5 fig, 1 tab, 13 ref.

Descriptors: *Plasticity, *Rheology, *Consolidation, *Clays, *Subsidence, California, Land subsidence, Aquifers, Liquid limits, Atterberg limits, Plasticity index, Seepage, Infiltration, Compaction, Groundwater, Groundwater movement, Soil mechanics, Rock mechanics, Water wells.
Identifiers: *San Joaquin Valley (Calif).

As one phase of research on land subsidence, laboratory analyses were made on many undisturbed cores obtained from sediments in subsiding areas of Central California. In 1948 Terzahi and Peck had presented equations relating compression index or coefficient of consolidation to liquid limit, but present research indicates that the same relationships do not hold for any of the sediments tested from Central California. The compression index could be estimated from liquid-limit data, but the relationship was different for each area of subsidence. Comparison of compression indices obtained from consolidation curves with indices computed from liquid limits showed better correlation for sediments of alluvial and lacustrine origin than for sediments of marine origin. Equations for the relationships were obtained by computer solution of data trends. In all three areas of subsidence, the coefficient of consolidation showed a general decrease for increasing values of liquid limit. However, the relationship could not be estimated with reasonable accuracy because the coefficient for any particular load range could vary through more than one order of magnitude for any given liquid limit. VISCO-ELASTIC THEORY OF THE DEFORMATION OF A CONFINED AQUIFER,
Kyoto Univ. (Japan). Disasters Prevention Research Inst.
Yoshiaki Fukuo.
In: Proceedings of the Tokyo Symposium on Land Subsidence, Vol 2, International Association of Scientific Hydrology and UNESCO, September 1969, Tokyo, p 547-562, 1970. 16 p, 4 fig, 6 ref.

Descriptors: *Subsidence, *Withdrawal, *Land subsidence, *Rheology, *Aquifers, Water levels, Water table, Water balance, Surface-groundwater relationships, Seepage, Infiltration, Compaction, Damages, Groundwater, Groundwater movement, Pumping, Soil mechanics, Rock mechanics, Water wells, Non-Newtonian flow, Plasticity, Viscosity, Confined water.
Identifiers: Japan.

The dynamic theory for the deformation of a granular solid saturated with a liquid, is derived assuming that the liquid filling up the pore space is a Newtonian viscous fluid and the skeleton constituted by solid particles is a linear visco-elastic solid. The theory consists of three fundamental equations, the equations of motion of liquid and skeleton and the equation of continuity between the particles and liquid. In a case where the particle and liquid are taken to be incompressible and the deformation of soil is a quasi-static process, these equations are accepted as the theory of three-dimensional consolidation including Terzaghi's well-known equation as a special case, and are also recognized as the basic equations of motion of confined groundwater in a visco-elastic aquifer. A theoretical example shows rheological deformation of an infinite confined aquifer with uniform thickness caused by pumping up water at a constant rate. (See also W71-03148) (Knapp-USGS)
W71-03426

COMPRESSION OF THE PEAT-BOGS AFTER DRAINING,
A. I. Murashko.
In: Proceedings of the Tokyo Symposium on Land Subsidence, Vol 2, International Association of Scientific Hydrology and UNESCO, September 1969, Tokyo, p 535-546, 1970. 12 p, 6 fig, 2 tab.

Descriptors: *Subsidence, *Withdrawal, *Land subsidence, *Drying, *Organic soils, Aquifers, Water levels, Water table, Water balance, Surface-groundwater relationships, Seepage, Infiltration, Compaction, Damages, Groundwater, Groundwater movement, Pumping, Soil mechanics, Rock mechanics, Water wells.
Identifiers: *Byelorussia (USSR).

Peat-bogs cover one fourth of the total territory of Byelorussia, or 4.5 million hectares. 70-80 thousand hectares of bogs are drained annually in the Republic for agricultural purposes. Peat compression results in diminishing of drain and canal depths, deformation of canal sections, and alternation of slopes of drain lines and relief. Methods are described for calculating peat compression, developed from solution of the differential equations developed by the author and utilization of data of long-term experiments. Formulas take into account thickness of peat layer and its density, characteristics of draining net system and duration of draining. They make it possible to calculate peat compression at any point of a peat-bog surface. (See also W71-03427) (Knapp-USGS)
W71-03427

SUBSIDENCE OF ORGANIC SOILS IN THE U.S.A.,
Agricultural Research Service, Athens, Ga. Soil and Water Conservation Research Div.
John C. Stephens, and William H. Speir.
In: Proceedings of the Tokyo Symposium on Land Subsidence, Vol 2, International Association of Scientific Hydrology and UNESCO, September 1969, Tokyo, p 523-534, 1970. 12 p, 5 fig, 17 ref.

Descriptors: *Subsidence, *Withdrawal, *Land subsidence, *Drying, *Organic soils, Aquifers, Water levels, Water table, Water balance, Surface-groundwater relationships, Seepage, Infiltration, Compaction, Damages, Groundwater, Groundwater movement, Pumping, Soil mechanics, Rock mechanics, Water wells.
Identifiers: *Everglades (Fla).

Organic soils subside when drained by shrinkage from drying, loss of groundwater bouyancy, compaction, wind erosion, burning, and biochemical oxidation. Relative loss due to each causative factor depends on soil origin, climate, and land management. Shrinkage rate is proportionate to drainage depth--the lower the water table, the greater the subsidence. Level surveys at 5-year intervals from 1913 to 1968 have established the pattern of subsidence in the Florida Everglades to be initially rapid, mainly from shrinkage and compaction, then declining to a continuous steady rate, primarily from oxidation until underlying mineral material is reached. Arable peats have average sinking rates of 3 cm per year. Predictive studies indicate that Everglades peats will be too shallow for agricultural use by 2,000 A.D. Under similar drainage, organic soils subside faster in warm climates, and lowmoor faster than highmoor peats. To conserve organic soils, water tables should be kept as high as crop and field requirements permit. (See also W71-03148) (Knapp-USGS)
W71-03428

PREDICTION OF HORIZONTAL MOVEMENTS DUE TO SUBSIDENCE OVER MINED AREAS,
California Univ., Los Angeles. Dept. of Engineering.
Kenneth L. Lee, and Michael E. Strauss.
In: Proceedings of the Tokyo Symposium on Land Subsidence, Vol 2, International Association of Scientific Hydrology and UNESCO, September 1969, Tokyo, p 512-522, 1970. 11 p, 8 fig, 7 ref.

Descriptors: *Subsidence, *Land subsidence, *Mining, Compaction, Damages, Groundwater, Groundwater movement, Soil mechanics, Rock mechanics, Water wells.
Identifiers: *Mine subsidence.

Some interrelations between vertical and horizontal movements in ground subsidence problems are summarized. The finite element method of analysis is shown to give a good prediction of the correct nature and magnitude of both vertical and horizontal movements resulting from mining subsidence. Two key features which are essential in order for horizontal movements to develop along with vertical subsidence are: first, the seat of major settlement must be located at some significant depth below the ground surface; and second, there must be significant differential vertical movement across the subsiding area. In subsidence areas where horizontal movement data have been obtained, there is no horizontal movement at the point of maximum subsidence, nor are there any horizontal movements at considerable distances beyond the subsidence zone. At each location the direction of horizontal movement is toward the zone of maximum settlement. The point of maximum movement corresponds to the point of steepest slope of the vertical subsidence profile, and the horizontal strain at this point is zero. The horizontal strain over much of the central part of the subsidence area is compressive, and extension strains develop near the outer edges of the subsidence zone. The point of maximum horizontal strain is located at the point of steepest of the horizontal movement curve. (See also W71-03148) (Knapp-USGS)

GROUNDWATER THERMAL REGIME IN A GLACIAL COMPLEX,
Department of Energy, Mines and Resources, Ottawa (Ontario). Inland Waters Branch.
Myles L. Parsons.
Water Resources Research, Vol 6, No 6, p 1701-1720, December 1970. 10 fig, 30 ref.

Descriptors: *Groundwater, Heat transfer, *Temperature, Hydrologic properties, Depth, Thermal conductivity, Mathematical models, Isotherms, Flow, *Glaciers, Glacial soils.
Identifiers: *Thermal regime, Surface cover.

A simple generalized model of a groundwater thermal regime is examined to develop insight into hydrologic and thermal framework. Numerical simulation of the groundwater thermal regime in a glacial complex in the northern Ontario clay belt and numerical modeling of a hypothetical groundwater basin suggest that groundwater flow has a significant effect on the subsurface temperature field. Borehole temperature measurements reflect the hydrogeologic contrast between the highly permeable eskerine deposits and the adjacent less permeable clay and till strata. The eskerine groundwater is several degrees warmer and possesses lower spatial temperature variations than does the clay-till groundwater. Numerical simulation of the temperature field indicates that the temperature variations are related to differences in thermal conductivities of the flow media, to variations in the magnitude of the groundwater flux between esker and clay-till flow systems, and to spatial variations in the water table temperature. The latter factor probably reflects contrasting surface cover conditions between the sandy eskerine terrain and the organic terrain of the clay plain. Contains 30 references. (Upadhyaya-Vanderbilt)

RELATIONSHIP BETWEEN HORIZONTAL STRAIN NEAR A WELL AND REVERSE WATER LEVEL FLUCTUATION,
Geological Survey, Washington, D.C.
Roger G. Wolff.
Water Resources Research, Vol 6, No 6, p 1721-1728, December 1970. 8 p, 8 fig, 11 ref.

Descriptors: *Water level fluctuations, *Strain, *Compaction, Subsidence, Porosity, Clays, Withdrawal, Shear stress, Hydraulic conductivity, Aquifers, Aquicludes, Pore pressure.
Identifiers: Pore pressure fluctuations.

Measurements of radial surface strains near a pumping well showed compression near the well that changed to tension farther away from the well. A theoretical model is presented. In general, this model reproduces the measured strains. Observations of anomalous increase in pore pressure in a clay adjacent to the pumped aquifer are related to the development of these strains. These increases in pressure are attributed to distortion of the pore space in the clay resulting from the transference of horizontal strain from the aquifer via shear. Applying a conceptual model that permits the transference of strain across confining layers to unpumped artesian aquifers accounts for reverse water level fluctuations. (Knapp-USGS)

STRATIGRAPHY, SEDIMENTOLOGY, AND MOISTURE CONTENTS IN A SMALL LOESS WATERSHED IN TAMA COUNTY, IOWA,
Iowa State Univ., Ames. Dept. of Agronomy.
W. J. Vreeken.
Iowa Academy of Science Proceedings, Vol 75, p 225-233, 1968. 9 p, 5 fig, 1 tab, 2 ref. OWRR Project A-014-IA (2).

Descriptors: *Loess, *Erosion, *Soil water, *Moisture tension, Sedimentation, Particle size, Particle shape, Sampling, Iowa, Hydrogeology, Soil physical properties.
Identifiers: Tama County (Iowa).

Particle-size analyses performed on many samples along a traverse across a first-order watershed in loess and integrated into a lithological profile show a clear vertical tripartition in the loess. Distinct stratification in the middle loess increment is shown by sand lenses and differences in silt fractions. Strong beveling of the strata in the south-facing slope indicates that this slope has experienced a higher rate of erosion than did the north-facing slope. Comparison of the lithological analysis with moisture distributions at different times within a one-year period shows a close relationship between particle-size distribution and moisture content. The explanatory physical phenomena must be moisture-tension relationships. (Knapp-USGS)

ORTHONORMAL FUNCTION TABLES AND THE SEEPAGE OF STEADY RAIN THROUGH SOIL BEDDING,
Iowa State Univ., Ames.
W. L. Powers, Don Kirkham, and G. Snowden.
Journal of Geophysical Research, Vol 72, No 24, p 6225-6237, December 15, 1967. 13 p, 6 fig, 5 tab, 9 ref. OWRR Project B-002-IA (7).

Descriptors: *Soil water movement, *Groundwater movement, *Seepage, *Flow nets, Drainage, Saturated flow, Mathematical studies, Furrow drainage, Furrow irrigation, Data processing, Numerical analysis.
Identifiers: *Computer techniques.

Tables of functions are developed for generating, with the aid of a digital computer, sets of general orthonormal functions useful in solving some potential flow problems. As an example of the use of the tables, a flow problem of seepage of groundwater through soil bedding (which is a series of formed parallel mounds and depressions used in land drainage design when soil overlies an impermeable layer) is solved. Flow nets are presented for a number of geometries for the bedding problem. It is noted that the bedding problem corresponds to the problem of seepage of groundwater into a shallow river between sloping hillsides when horizontal bedrock underlies the river valley. EXPLANATION OF PARADOXES IN DUPUIT-FORCHHEIMER SEEPAGE THEORY,
Iowa State Univ., Ames. Dept. of Agronomy.
Don Kirkham.
Engineering News, Vol 12, No 1, p 22-39, March 1967. 18 p, 10 fig, 29 ref. OWRR Project B-002-IA (6).

Descriptors: *Dupuit-Forchheimer theory, *Soil water movement, *Groundwater movement, Darcys law, Permeability, Anisotropy, Water levels, Drawdown, Percolation, Infiltration, Drainage, Seepage.
Identifiers: *Seepage theory.

Cutting into a porous medium of a large number of vertical, parallel, infinitely permeable, equally spaced, infinitesimally thin slots produces a fictitious soil that follows exactly and without paradoxes Dupuit's assumptions and hence Dupuit-Forchheimer (D.F.) drainage theory in two dimensions. A soil having these infinitesimally thin slots is designated a D.F. soil. Dupuit's two-dimensional 'parabolic seepage problem' and others, may now be considered as exactly solvable for D.F. soils. For three-dimensional axially symmetric seepage flow, as into wells, the fictitious slots of a D.F. soil become concentric coaxial rings. D.F. streamlines are not horizontal; they converge in a special way. Some differences between the behavior of D.F. soils and real soils are: (1) D.F. theory gives too low a water table, that is, drain spacings must be closer than D.F. theory gives to establish a given water table height; (2) D.F. theory gives a better approximation for flow into ditches than into tiles; (3) D.F. theory fails completely (gives infinite drain spacings) when the impermeable layer is at infinite depth; (4) streamlines in a D.F. soil converge to a plane vertical outflow surface or to a cylindrical vertical outflow surface; and (5) the equipotentials and streamlines in D.F. theory comprise a non-orthogonal flow net. (Knapp-USGS)

FRACTIONATION OF PHOSPHATE IN A MATURITY SEQUENCE OF NEW ZEALAND BASALTIC SOIL PROFILES: I,
Lincoln Coll., Canterbury (New Zealand).
J. D. H. Williams, and T. W. Walker.
Soil Science, Vol 107, No 1, January 1969, p 22-30. 2 tab, 1 fig, 24 ref.

Descriptors: *Phosphates, *Soil profiles, *Soil chemical properties, *Weathering, *Basalts,

aching, Soil water, Calcium, Equilibrium, osphorous, Ammonium salts, Sodium com- unds, Sierozems, Soil horizons, Iron, Aluminum, neralogy, Sampling, Variability.
ntifiers: *Fractionation, *Maturity sequence, ew Zealand, *Occlusion, Chang-Jackson ocedures.

rganic phosphate in 62 horizons from 16 New aland basaltic soils varying in weathering and ching degree was fractionated and studied. d-extractable Ca-P declined, and NH sub 4 F-P reased and then declined with increased athering. Reductant soluble P, secondary OH-P and residual inorganic P increased. First OH-P fraction showed no trend. Fractions, par- ilarly NH sub 4 F-P, reflected soil mineralogy. n- and aluminum-bound phosphate fractions e consistent with the theory that these catego- in freely-drained unfertilized soil consist of sphate ions randomly retained in non-occluded occluded form by Fe- and Al-containing soil. s implies that no absolute distinction can be wn between categories, and that the arbitrari- s of Chang and Jackson-type procedures is her increased when occluded Al-bound sphate is present. A sequential paper (Soil ence, Vol. 107, No. 3) proposes 'maturity uence' related to generalized weathering uence and equilibrium with soil water. Tables w phosphate fraction values and mean values several properties. (See also W71-03483) (Pop- -Arizona)

ACTIONATION OF PHOSPHATE IN A TURITY SEQUENCE OF NEW ZEALAND SALTIC SOIL PROFILES: 2,
coln Coll., Canterbury (New Zealand).
. H. Williams, and T. W. Walker.
Science, Vol 107, No 3, March 1969, p 213- . 2 tab, 4 fig, 11 ref.

criptors: *Phosphates, *Soil profiles, *Soil mical properties, *Basalts, *Weathering, ching, Soil water, Equilibrium, Phosphorous, monium salts, Slerozems, Soil horizons, eraiogy.
ntifiers: *Fractionation, *Maturity sequence, ew Zealand, *Occlusion, Chang-Jackson cedures, Apatite, Pedogenesis.

nges in relative amounts of phosphate in tite, organic phosphate, and non-occluded and luded forms of secondary inorganic phosphate ng pedogenesis were illustrated by a 'maturity uence' of 16 New Zealand basaltic soil profiles. iculties in defining these categories and in their surement due to inadequacies in Chang and kson-type procedures are discussed. Mineralog- differences between and within soil profiles partly account for the similarity in organic P NH sub 4 F-P behavior within profiles, but the tionship also reflects equilibrium between or- ic phosphate and non-occluded forms of secon- inorganic phosphate. The hypothesis that sphate in apatite is transformed into occluded sphate by these forms accounted for distribu- changes of phosphate between the fractions increasing profile maturity. The generalized thering sequence and equilibrium with soil er are considered. Tables show phosphate frac- profiles and nomenclature. Figures show mean es of Ca-P, and various P as percentage of total tal inorganic P, phosphate fraction transforma- in acid soils and phosphate fraction magnitude nges. THE CHELATION AND MOVEMENT OF SR89-SR90 (Y90) IN A CALCAREOUS SOIL,
Arizona Univ., Tucson.
Michael F. L'Annunziata, and Wallace H. Fuller.
AEC AT (11-1)-947. Soil Science, Vol 105, No 5, May 1968, p 311-319. 3 tab, 10 fig, 27 ref.

Descriptors: *Strontium radioisotopes, *Chelation, *Radioactive wastes, *Calcareous soils, *Leaching, Soil water movement, Arid lands, Electrophoresis, Radioactivity effects, Color reactions, Calcium, Hydrogen ion concentration, Assay, Stability, Structure, Soil chemistry, Sands, Loam, Southwest U.S., Distribution patterns, Radioisotopes.
Identifiers: *Synthetic chelates, *Natural organic chelates, Phosphomolybdotungstic aicd, HEEDTA, DCyTA, EDTA, EGTA, DTPA.

The influence of synthetic chelating agents on radiostrontium movement through soil with leaching was studied. Phosphomolybdotungstic acid (Folin-Ciocalteau Reagent) was an excellent indicator for chelons, producing a blue color with Nu sub 2 CO sub 3 addition. Color reaction and paper electrophoresis indicated the presence of radionuclide complexes in the soil solution as formed by synthetic chelates. Displacement of Sr 89 from columns of Mohave sandy loam was 19, 38, 44, 47 and 81 percent for HEEDTA, DCyTA, EDTA, EGTA and DTPA. Only 5 percent of the Sr 89 was leached in the absence of synthetic chelates. Natural organic chelates did not influence radiostrontium movement. Tables of stability constants of chelates with Ca and Sr, leaching treatments and carboxyl, chelate and effectiveness of Sr movement interrelationships are presented. Figures show structural formulas; chelation of Ca with synthetic chelates; Sr 89 displacement, movement, percentage and profile distribution; electrophoresis of radiostrontium and displaced soil solution; and general chelating reaction. Commonwealth Scientific and Industrial Research Organization, Canberra (Australia). Div. of Land Research.
B. G. Williams.
Soil Science, Vol 105, No 5, May 1968, p 376-377. 2 fig, 5 ref.

Descriptors: *Leaching, *Equipment, *Infiltrometers, *Permeameters, *Infiltration, *Permeability, Soil physics, Suspension, Hydraulic conductivity, Cation exchange, Tubes, Drainage water, Arid lands, Sampling, Filters, Flow control, Rates of flow.
Identifiers: *Intrinsic permeability, Reverse flow.

Leaching tests are important in determining soil properties in arid lands for agricultural and hydrologic studies. A soil leaching apparatus which controls colloidal material loss is described in this paper. Reverse flow of the extracting solution is the leaching method used. This results in partial suspension of the sample, free access of the solution to all soil particles and avoidance of find particle packing. Leaching tubes are constructed from 'perspex.' Twelve tubes can be arranged to be fed from one manifold with individual stopcocks. A manifold tap reduces the flow when desired. Infiltration, hydraulic conductivity, intrinsic permeability, cation exchange capacity and effect of soil on drainage water may be measured with this apparatus. Two sketches of the leaching tube and apparatus are shown. (Popkin-Arizona)

A SOIL AND VEGETATION PATTERN IN THE SANTA CATALINA MOUNTAINS, ARIZONA,
California Univ., Irvine; and North Carolina State Univ., Raleigh.
R. H. Whittaker, S. W. Buol, W. A. Niering, and Y. H. Havens.
NSF grant. Soil Science, Vol 105, No 6, June 1968, p 440-450. 2 tab, 2 fig, 50 ref.

Descriptors: *Soil texture, *Mountains, *Distribution patterns, *Arizona, *Vegetation, Soil-water-plant relationships, Mexico, Calcium, Magnesium, Potassium, Nitrogen, Biomass, Air temperature, Arid lands, Soil profiles, Elevation, Soil horizons, Slopes, Color, Depth, Sampling, Temperature, Topography, Organic matter, Plant populations, Biological communities, Ecosystems, Sierozems, Fluctuation, Thermocline, Desert plants.
Identifiers: *Santa Catalina Mountains (Arizona), *Desert range, Carbon/nitrogen ratio, Topographic moisture gradient, Elevation gradient.

The Santa Catalina Mountains are a desert range in southeastern Arizona with Mexican affinities in their floras and faunas. Soil characteristics and temperatures and vegetation were studied in a transect across the Santa Catalinas. Trends of interrelated characteristics of plants and soils were observed from high to low elevations: decreasing productivity, biomass and coverage of plant communities; shifts in growth-form composition of communities; decreasing litter cover and organic soil content; increasing annual and diurnal amplitude of soil temperature; decreasing nitrogen content and C/N ratios of soils; increasing pH; and increasing Ca, Mg and K contents. Trends along the topographic moisture gradient paralleled these along parts of the elevation gradient. The elevation and topographic moisture gradients define a pattern of mountain ecosystems, comprising corresponding patterns of climatic and topographic environments, soils and plant communities. Tables show summary of measurements and profile descriptions. Figures show the pattern of plant communities to elevation and topography and soil characteristic trends to elevation. (Popkin-Arizona)

Descriptors: *Saline salts, *Salts, *Clays, *Soil texture, *Arid lands, Rainfall, Topography, Drainage, Soil chemistry, Salinity, Dunes, Permeability, Evaporation, Electrical conductance, Subsoil, Soil horizons, Maps, Sampling, Depth, Distribution patterns, Sodium, Topsoil, Geomorphology, Surface drainage, Colluvium, Alluvium, Lake shores.
Identifiers: *Republic of the Sudan, *West Central Gezira (Sudan), White Nile (Sudan), Closed depressions, Clay plains, Salinity controls, Extractable sodium, Exchangeable sodium.

Subsoil and topsoil salinity was mapped for 1.3 m. acres of land bordering the White Nile between Khartoum and Rabak, in the Sudan. Salt peaks in the second horizon except in the southern colluvial clays, where it increases with depth. Relationships between salinity and rainfall, soil texture, topography, drainage and soil chemical properties are discussed. Soils are saline in closed depressions and

on the northern clay plains. Soils are non-saline on dunes, recent alluvial terraces and colluvial upland clays. Subsoil salinity is highest around former lake margins, and decreases with increasing elevation. Soil texture, permeability and topography are dominant salinity controls. Rainfall and evaporation have a minor influence on salt distribution in this area. Figures include physiographic and soil maps, topsoil and subsoil electrical conductivity distribution, soil class and electrical conductivity relations, relation between depth and salinity, exchangeable sodium and clay content relationships, and total extractable sodium and electrical conductivity relations. (Popkin-Arizona)

MORPHOLOGY OF THE ARGILLIC HORIZON IN DESERT SOILS OF SOUTHERN NEW MEXICO,
Soil Conservation Service, University Park, N. Mex.
L. H. Gile, and R. B. Grossman.
Soil Science, Vol 106, No 1, July 1968, p 6-15. 2 tab, 7 fig, 15 ref.

Descriptors: *Soil horizons, *Sierozems, *Clays, *Geomorphology, *New Mexico, Carbonates, Montmorillonite, Abrasion, Soil moisture, Energy, Animals, Root systems, Recent epoch, Pleistocene epoch, Calcium carbonate, Arid lands, Sands, Pedocals, Age, Geologic time, Soil types, Depth, Particle size, Soil profiles.
Identifiers: *Argillic horizon, *Authigenic carbonate, *Illuviation, Clay skin.

The argillic horizon in a southern New Mexico desert is affected by anthigenic carbonate, silicate clay and coarse fragments. Prominent horizons occur only in soils of Pleistocene age. Clay skins are not a requirement for an argillic horizon. Many oriented clay bodies are clay skin remnants formed on ped surfaces during Pleistocene pluvial periods and are evidence of an illuvial origin. Clay skins are found on ped surfaces in pipes of overthickened horizons in buried Pleistocene soils. These skins are evidence of clay Pleistocene illuviation. Clay skin preservation through Recent time requires restricted physical disturbance, though authigenic carbonate accumulation, shallowness of horizon and access by roots and fauna, high energy, moisture changes and montmorillinitic clay favor disturbance. Oriented clay coatings are typical of Bt horizons of the area. The coatings are strongly expressed in the silicate clay horizon and are markers of clay illuviation. Expression of argillic horizon is related to soil age, carbonate accumulation horizon, subjection to abrasion during moisture changes and other Pleistocene events. Tables show illustrative soils, geomorphic surfaces, ages and laboratory data for soils. (Popkin-Arizona)

QUANTITATIVE STUDIES OF ROOTS IN SOIL. I. LENGTH AND DIAMETERS OF COTTON ROOTS IN A CLAY-LOAM SOIL BY ANALYSIS OF SURFACE-GROUND BLOCKS OF RESIN-IMPREGNATED SOIL,
Commonwealth Scientific and Industrial Research Organization, Griffith (Australia). Irrigation Research Lab.
F. M. Melhuish, and A. R. G. Lang.
Soil Science, Vol 106, No 1, p 16-22, July 1968. 2 tab, 4 fig, 7 ref.

Descriptors: *Root distribution, *Soil-water-plant relationships, *Resins, *Soil water movement, *Cotton, Soil water, Clay loam, Porosity, Pores, Probability, Analytical techniques, Sampling, Length, Surfaces, Measurement, Instrumentation, Plant growth, Voids, Mathematical studies.
Identifiers: *Derivation, Mean root surface area.

Distribution and measurement of the roots of a cotton plant grown in a drum of clay-loam soil are described in this paper. Core soil samples were oven-dried and vacuum impregnated with a thermosetting polyester resin. Plane surfaces were prepared by surface grinding the cured samples. Root analysis was determined by measurement of voids left in the soil after drying and root shrinkage. A theoretical derivation based on geometrical probability of probable root length per unit soil volume from the numbers of roots intersecting a plane of known area was verified experimentally. The probable root length per unit volume and probable mean root surface area per unit volume were calculated. Root distribution in the drum of soil was expressed quantitatively and reliably. Measurements obtained in this way are to be applied in studies of water movement from soil to plants. Figures show the drum and sampling positions, root number versus root length, root void distribution and root number relation to surface area. There are 4 equations, and a table of root surface area as a position function. (Popkin-Arizona)

EFFECTS OF PETROLEUM MULCH ON SOIL WATER CONTENT AND SOIL TEMPERATURE,
Oregon State Univ., Corwallis. Dept. of Soils.
Ahang Kowsar.
MS Thesis, Oregon State University June 1968. 103 p, 45 fig, 6 tab, 49 ref. OWRR Project B-001-ORE (2).

Descriptors: *Mulching, *Soil-water-plant relationships, *Soil temperature, *Crop response, Evaporation control, Water conservation, Soil water movement, Soil environment, Laboratory tests.
Identifiers: *Petroleum mulches.

Petroleum mulch applied on the soil surface over a row of planted seeds promotes a more rapid and a more uniform germination of seeds, enhance elongation of seedlings and in some cases increases the yield of the crop. An experiment was designed so that changes in soil temperature and soil water content of mulched and unmulched soil, subjected to the same radiation, could be measured under controlled conditions. Soil at a predetermined water content was packed into boxes. A band of mulch was applied to one side of the slab. The soil was subjected to a temperature cycle by turning on infrared heat lamps at 8:00 A.M., increasing the energy output until 2:00 P.M. and then decreasing the energy output until the lights were turned off at 8:00 P.M. Soil temperatures, water content, and heat flux were measured at regular intervals. The mulch-covered soil was about 5 deg C warmer than the bare soil when the soil temperatures attained maximum value. The bare soil rapidly lost water in the upper 4 cm. The mulch covered soil lost water in the upper cm of soil but gained water deeper. The beneficial effect of petroleum mulch is attributed to improved soil water conditions as well as to improved soil temperature conditions. (Knapp-USGS)

SOIL MATRIC SUCTION CHANGES WITH TIME IN PRESSED SOIL BRIQUETTES,
Minnesota Univ., Minneapolis. Dept. of Soil Science.
Victor C. Fuentes.
MS Thesis, Minnesota University, July 1970. 68 p, 13 fig, 2 tab, 59 ref. OWRR Project B-015-MINN (3).

Descriptors: *Soil water movement, *Compacte soils, *Soil moisture, *Moisture content, Laborat ry tests, Free energy, Time, Soil structure, Soil pr perties, Mass transfer, Crystallizatio Monomolecular films, Dehydration, Soil strengt Soil physical properties, Soil physics.
Identifiers: *Soil matric suction, Clarion loam.

A Clarion loam surface soil was pulverized wh dry to pass a 0.3 mm sieve. Samples were wetted water contents ranging from 0.215 to 0.458 g/g a pressed in a brass chamber at 3.5 Kg/sq cm. At lo water contents (less than 0.258 g/g) there was rapid decrease in soil matric suction with time af pressing, indicating an increase in the free ener state of the water. At higher water contents, t rate of decrease in matric suction was smaller. A water content of 0.258 g/g, suction remained co stant with time. This indicates that at this wat content the crystal internal space had a wat monomolecular layer that kept the surfaces at equilibrium distance. Therefore, there was not mass transfer gradient present. At water conte over 0.258 g/g soil matric suction increased w time. In order to more fully understand the proc of stabilization in newly-formed soil aggregat changes in soil matric suction that come about d ing aging of pressed soil were measured. The ag process suggests a thixotropic reaction in whi water content is known to be an important fact (Woodard-USGS)

preliminary reconnaissance of areas to be im-nded in the Salt River basin of Kentucky ex-ded from 1 April through 30 June 1968. Since first impoundment was to be at Taylorsville on Salt River, principal effort was expended in that nage area. A preliminary survey of vascular nts of the area to be inundated by Taylorsville ervoir, Salt River basin, Kentucky was made to ect and catalog specimens of vascular plants, to ct areas for future intensive studies of in-enous plant communities, and to select sites for g-term studies of the effects of inundation. More n 100 species of plants referable to more than families were collected, identified, and loged. More than 50 species are indigenous to area. The area is productive of animals. The in-ebrate and vertebrate faunas are abundant and erse. Preliminary stations for the collections of atic organisms, water samples, and other data germane to the study were established. PHOTOSYNTHETIC SYSTEMS OF MEDITERRANEAN-CLIMATE SHRUBS AND TREES OF CALIFORNIA AND CHILE,
Stanford Univ., Calif. Dept. of Biological Sciences.
H. A. Mooney, and E. L. Dunn.
NSF (GB 8184) (GB 5223). American Naturalist, Vol 104, No 939, p 447-453, September-October 1970. 5 fig, 1 tab, 6 ref.

Descriptors: *Photosynthesis, *Leaves, *Root systems, *Habitats, *Water balance, Semiarid climates, Biological communities, Ecosystems, Shrubs, Trees, Xerophytes, Cacti, California, Chaparral, Carbon dioxide, Ecological distribution, Drought tolerance, Drought resistance, Altitude, Environmental effects, Mode of action, Energy budget, Energy conversion, Efficiencies, Light, Temperature, Soil moisture, Gradation, Soil-water-plant relationships, Deciduous trees, Coniferous trees, Wet seasons, Dry seasons.
Identifiers: *Evergreens, *Sclerophyllous plants, *Succulents, *Chile, Assimilation, Mediterranean climate.

Mediterranean-type climatic areas of both California and Chile lie in the same latitudinal zones. Dominant growth forms of the plant communities occur at about the same position along a moisture gradient extending over 80-1600 mm annual precipitation. From wet to dry end of the gradient occur evergreen trees, evergreen shrubs, drought-deciduous shrubs and succulents. Plant cover, stature and evergreen leaf size decrease with increasing aridity. Since these communities from each hemisphere have had different evolutionary histories, convergent evolution suggests limited adaptive options along these climatic gradients. The drought-deciduous plants have photosynthetic rates twice as great as the evergreen species. Further, they are characterized by shallow root systems which more efficiently utilize temporally limited soil moisture and lower foliage densities which eliminate competition for light and facilitate carbon dioxide uptake. When water supplies vanish, the leaves are shed. The low energy costs in leaf production combined with high assimilation capacity result in much more energy available for growth and storage per unit time in contrast with the evergreen species and their small, densely packed, yearround leaves with deep roots utilizing deep soil water. THE ROLE OF THE MESOPHYLL CELL WALL IN LEAF TRANSPIRATION,
Australian National Univ., Canberra. Research School of Biological Sciences.
P. G. Jarvis, and R. O. Slatyer.
Planta (Berlin), Vol 90, No 3, p 303-322, 1970. 7 fig, 28 ref.

Descriptors: *Water balance, *Leaves, *Stomata, *Vapor pressure, *Water transfer, Nitrogen compounds, Plant physiology, Saturation, Evaporation, Flow control, Resistance, Moisture stress, Carbon dioxide, Transpiration, Evapotranspiration control, Mode of action, Physiological ecology, Cytological studies, Cuticle, Pores, Diffusion, Hydraulic conductivity, Equations, Moisture content, Cotton, Water vapor.
Identifiers: *Water potential, *Leaf mesophyll, *Leaf flow resistances.

Two main pathways are generally recognized in plant transpiration: movement through cuticles and movement through stomatal pores. Stomatal resistance has generally been considered the limiting factor in transpiration of water-stressed plants but other mechanisms, particularly lengthening of mesophyll cell diffusion pathways, have been considered. The value of the cell wall resistance (r sub w) was determined by calculating and comparing leaf resistances to water vapor diffusion and to nitrous oxide vapor diffusion. The latter will not contain r sub w. The 2 outstanding results were that r sub w values were greater than 2.0 sec/cm and that they increased with increasing transpiration rates and water stress. In the calculations, the same result would be obtained with increasing r sub w or decreasing water vapor concentration at the cell evaporating surface (c sub w). A number of possible mechanisms were considered and it is felt that the most likely is the existence of a zone of low hydraulic conductivity associated with the cutinized outer cell wall layer which leads to decreasing c sub w. It is conceded that the long-standing assumption of uniform saturation vapor pressures at cell wall evaporating sites, may not be true. (Casey-Arizona)

A CRITICAL EVALUATION OF TISSUE-IMMERSION METHODS FOR MEASUREMENT OF PLANT WATER POTENTIAL,
Arizona Univ., Tucson. Environmental Research Lab.
James W. O'Leary.
Ohio Journal of Science, Vol 70, No 1, p 34-38, January 1970. 1 fig, 30 ref.

Descriptors: *Osmotic pressure, *Free energy, *Laboratory tests, *Plant tissues, *Plant physiology, Analytical techniques, Water analysis, Thermodynamic behavior, Physicochemical properties, Equilibrium, Movement, Flow, Moisture uptake, Mode of action, Absorption, Water measurement, Flow measurement, Moisture stress, Measurement, On-site investigations, Infiltration.
Identifiers: *Water potential, *Plant-water relationships, *Tissue-immersion methods.

Water moves into, through and out of plants along free-energy gradients expressed by the term water potential (psi). Since water potential reflects plant water stress, its measurement in the field is desirable. For practical reasons, only methods involving immersion of tissue segments in graded osmotic solutions are possible. Theoretically, equal values should be obtained by measurements of tissue change (length, weight, or volume) and by measurements of solute concentration changes. Cylinders of potato tissue were immersed in sucrose solutions of 1-12 bars osmotic pressure and water potentials were measured by the Schardakow-dye method and the change-in-length method. In 8 of 14 measurements the change-in-length underestimated psi. Errors inherent in the method are discussed. Probably the most crucial error factor is infiltration into intercellular spaces leading to tissue stretching. It is concluded that only the dye method is suitable for field measurements. THE BEHAVIOR OF LARREA DIVERICATA (CREOSOTE BUSH) IN RESPONSE TO RAINFALL IN CALIFORNIA,
Oxford Univ. (England). School of Botany.
S. R. J. Woodell, H. A. Mooney, and A. J. Hill.
Journal of Ecology, Vol 57, No 1, p 37-44, March 1969. 2 fig, 3 tab, 15 ref.

Descriptors: *Vegetation, *Xerophytes, *Sampling, *Ecology, *On-site investigations, Arid lands, Environmental effects, On-site data collections, Estimating, Measurements, Probability, Reliability, Statistical methods, Variability, Rainfall, Shrubs, Deserts, Mode of action, Competition, Root systems, Biological communities, California, Density, Crop response, Distribution patterns, Correlation analysis, Spatial distribution.
Identifiers: *Creosote bush.

Creosote bush locations in 8 differing desert areas were sampled and analyzed for spacing regularity. The spatial distribution were then correlated with rainfall. The sampling methods used were either the variance/mean ratio or Pielou's point-to-plant distance method, which uses density estimates and a selection of random points. The results showed a

fairly good correlation of density with annual rainfall. Larrea density seemed independent of other shrubs, although all followed the same general trends. The density of other shrubs was high on coarser soils with moderate rainfall and low on either sandier soils or lower rainfall. Regular distribution in sparse Larrea stands is very likely a result of root competition for available water. The theory of spacing by toxic root secretions was considered and deemed unlikely. ECO-PHYSIOLOGICAL STUDIES ON PLANTS IN ARID AND SEMI-ARID REGIONS IN WESTERN AUSTRALIA. II: FIELD PHYSIOLOGY OF ACACIA CRASPEDOCARPA F. MUELL.,
Western Australia Univ., Nedlands. Dept. of Botany.
Erhart O. Hellmuth.
Journal of Ecology, Vol 57, No 3, p 613-634, November 1969. 10 fig, 6 tab, 29 ref.

Descriptors: *Physiological ecology, *Photosynthesis, *Transpiration, *Water balance, *Xerophytes, Arid lands, Legumes, Water conservation, Solar radiation, Temperature, Osmosis, Desert plants, On-site investigations, Metabolism, Environmental effects, Mode of action, Photoactivation, Cuticle, Drought resistance, Heat resistance, Light, Carbon dioxide, Microenvironment, Stomata, Turgidity, Economic efficiency, Moisture deficit, Semiarid climates, Diurnal, Seasonal.
Identifiers: *Australia, *Acacias, *Phyllodes, *Transpiration ratio, *Water potential, Sclerophyllous plants, Photosynthetic efficiency.

Acacia craspedocarpa is a phyllodinous sclerophyll type xerophyte of Western Australia. As the dry season progresses, the phyllodes turn from green to yellowish and their cuticles thicken and develop and 'epistomal cavity' which reduces to a narrow pore - 3-5 microns wide. Essentially this structure increases resistance to water movement without affecting carbon dioxide assimilation so that photosynthetic efficiency increases throughout the summer. Stomatal closure does not occur even though transpiration decreases with increasing water deficit. This is correlated with a number of other xeric adaptations. Saturation light intensities for photosynthesis were fairly low (about 850-1000 ft. -candles). Once saturation intensities were achieved, both photosynthetic and respiration rates were controlled by phyllode temperatures, which were never greater than 6 degrees C. above air temperature. Therefore, they never reached the point of heat damage. Water deficits reach 33 percent before zero turgor is reached; possibly hydrophilic colloids with imbibitional forces are involved. VEGETATION OF THE ERER-GOTA PLAIN, ETHIOPIA,
Haile Sellassie I Univ., Addis Ababa (Ethiopia).
Edward W. Beals.
NSF GB-1694. Journal of Ecology, Vol 57, No 3, p 655-667, November 1969. 4 fig, 3 tab, 24 ref.

Descriptors: *Distribution patterns, *Vegetation, *Biological communities, *Semiarid climates, *Ecological distribution, Shrubs, Trees, Grasses, Data collections, On-site investigations, Ecosystems, Sampling, Data processing, Statistics, Legumes, Plant groupings, Plant populations, Hardpan, Soil moisture, Salinity, Mapping, Environmental effects, Rainfall, Altitude, Nitrogen, Correlation analysis, Frequency analysis, Grasslands.
Identifiers: *Stand arrangement, *Plant associations, *Africa, *Ethiopia, Base exchange capacity, Ordination.

Species and vegetation-type distributional patterns of 6 semidesert plant communities were analyzed by ordination techniques. The study area was the southern Afar Depression of Ethiopia where rainfall estimates are 25-50 cm/year. Data analysis was based largely on Cole's index of association and each species was placed in a 2-dimensional ordination. Coordinates of the ordination were used as adaptation numbers to place each of the 18 stands of vegetation in a 2-dimensional continuum. The following vegetation types were discerned: open grassland, Acacia arabica scrub, A. ehrenbergiana scrub, Cadaba rotundifolia scrub, Tamarix orientalis woodland and A. nubica scrub. In all stands perennial grasses were the dominant cover. The stand ordination maps showed a clearcut separation between the first 3 and the last 3 vegetation types. The break probably results from presence of a hardpan below soil surface in the former stands. The same stands were also much richer in salts. Ecological factors underlying the various distributions are discussed and ordination techniques seem valid. Correlations appear probably between stand arrangement and water level, particularly in view of rainfall and soil moisture retention. Definite correlations were found between stand arrangement and altitude, soil base exchange capacity, and soil N. (Casey-Arizona)

ESTIMATION OF WATER STRESSES IN THE ACTIVE ROOT ZONE OF SOME NATIVE HALOPHYTES IN ISRAEL,
Tel Aviv Univ., (Israel). Dept. of Botany.
Y. Waisel, and G. Pollak.
Journal of Ecology, Vol 57, No 3, p 789-794, November 1969. 2 fig, 2 tab, 9 ref.

Descriptors: *Soil-water-plant relationships, *Halophytes, *Arid lands, *Moisture stress, *Root systems, Physiological ecology, Habitats, On-site investigations, Shrubs, Xerophytes, Biological communities, Laboratory tests, Wilting point, Soil horizons, Soil texture, Niches, Environmental effects, Balance of nature, Water balance, Drought tolerance, Drought resistance, Moisture content, Fluctuation, Monthly, Equilibrium, Plant growth.
Identifiers: *Water potential, *Israel.

Since plant habitats are highly variable, both topographically and in soil layers, root moisture stress determinations by soil sampling are almost impossible. Glass sleeves were installed on branches of naturally growing large halophytic plant species in a saline area near the Dead Sea. Between 6-12 weeks later adventitious root systems developed inside the sleeves and their water potentials equilibrated with the water potentials of the sleeve soils. The adventitious root and ground root water potentials were linearly correlated. Mean water potentials obtained for various months of the year ranged for -0.340-50 bars, depending on the species and ecological niche. The lower stress levels were far beyond the 1-15 bar wilting point usually found in the lab. Depending upon magnitude of annual stress fluctuations and year-round growth, the plants were classified as: (1) poikilohydric drought avoiding - Aeluropus litoralis, (2) poikilohydric drought enduring - Arthrocnemum glaucum and Tamarix jordanis and (3) stenohydric drought enduring - Suaeda monoica and Nitraria retusa. Despite occurring together in the same habitat, Tamarix and Suaeda roots exploited different soil horizons. (Casey-Arizona)

Cesium uptake by four arid soils in micro
macroamounts with salts was studied by a mod

bauer technique using sudangrass as a testing
t. Little differences were exhibited when Cs ad-
ons ranged from 10 to the minus 7 to 10 to the
us 2 meq/100g soil. Cs toxicity symptoms com-
ced when Cs concentration in the shoots were
to 0.03 meq/Cs/g dry shoots. When Cs was
ed to soils in microamounts (less than 10 to the
us 4 meq/100g) with different salts, Cs availa-
y was influenced by the salt concentration,
cially of K and NH sub 4 salts. When 0.1 meq
l was added to 100 g soil, the Nh sub 4
ancing effect on Cs absorption did not occur.
nder macroconcentration affect K and NH-
availability. For any concentration of Cs
d, the Cs uptake was higher when it was added
rather than before Nh sub 4 or K ions, espe-
y in vermiculitic soils and with increasing Cs
entration. Tables of salt, soil KCl and NH sub
and CsCl effects on Cs uptake by sudangrass
lings are included. (Popkin-Arizona)

J. J. Franco.
Prepared for presentation at the Hydrologic Engineering Seminar on Sediment Transport in Rivers and Reservoirs, held at Hydrologic Engineering Center, Davis, Calif., April 1970. U.S. Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Miscellaneous Paper H-70-2, April 1970. 16 p, 6 ref.

Descriptors: *Sedimentation, *Sediments, *Sediment transport, Hydraulic models, Alluvial channels, Rivers.

Movement of sediment in alluvial streams presents many problems that must be considered in the development and improvement of these streams for navigation and flood control. Laboratory investigations have contributed to a better understanding of sedimentation processes, but very little information is available on control of sediment movement in natural streams. The Waterways Experiment Station has conducted a number of studies concerned with the solution of specific problems in unusually troublesome or unstable reaches. Some of these studies and results, summarized in this report, are: Arkansas River development for navigation; movement of sediment between locks and dams; shoaling in lower lock approach; dike systems; bifurcated channels; and open river problems. DeLynn R. Ray, D. F. Kibler, and C. E. Busby.
Available from NTIS as AD-713 644, $3.00 in paper copy, $0.95 in microfiche. Technical note, WLC-TN-70-018, Aug 1970. 25 p, 14 ref. Air Force Contract F29601-69-C-0039.
Identifiers: *Erosion, Control, *Sails, Erosion, *Construction, Military facilities, State-of-the-art reviews, Rainfall, Drainage, Intensity, Exposure, Terrain, Wind, Water, Particles, Air Force Operations.

A state-of-the-art review of the soil erosion field as it relates to the erosion control needsof the US Air Force was conducted. The review will serve as a guide for preparation of a Base Civil Engineer erosion control handbook. Typical military construction activities which have exposed large areas of unprotected soil and subsequently have led to serious erosion problems are presented. Factors involved in the wind and erosion processes are discussed and soil-loss equations and soil erodibility indices are reviewed. The erodibility indices are reviewed. The erodibility K-factor in the ARS soil-loss equation is evaluated for land management planning techniques. Guidelines for effective erosion control practices to protect exposed land surfaces against soil particle detachment and transport by either water or wind are presented. Further efforts to establish a more reliable erodibility index which can be used to define areas of highly erodible soils, especially for subsurface soils that are exposed during construction are indicated.

SEDIMENT TRANSPORTATION MECHANICS: F. HYDRAULIC RELATIONS FOR ALLUVIAL STREAMS.

ASCE Proceedings, Journal of the Hydraulics Division, Vol 97, No HY1, Paper 7786, p 101-141, January 1971. 41 p, 10 fig, 2 tab, 64 ref, append.

Descriptors: *Alluvial channels, *Sediment transport, *Bed load, *Sedimentary structures, *Channel morphology, Sedimentation, Streamflow, Fluid friction, Roughness (Hydraulic), Stage-discharge relations, Discharge (Water), Discharge measurement, Velocity.
Identifiers: *Bed forms (Alluvial channels).

The several bed forms found in alluvial streams are described and the theoretical treatment of these forms is outlined briefly. The general problem of flow in alluvial streams is then analyzed in general terms and the variables governing such flows and the seven relationships between them are identified. Among these relationships are the friction factor relation and the sediment discharge relation which are of primary importance to engineers. This analysis serves as an introduction to the main part which deals with prediction of the stage-discharge relation. In this part several of the most important methods of calculating these relations are presented clearly and concisely. The paper will be of interest to many engineers and engineering students not only because it presents practical methods for calculating the relation between discharge, velocity and depth of alluvial streams but also because of the fundamental concepts outlined in it. (See also W71-03668) (Knapp-USGS)
W71-03667

SEDIMENT TRANSPORTATION MECHANICS: Q. GENETIC CLASSIFICATION OF VALLEY SEDIMENT DEPOSITS.

ASCE Proceedings, Journal of the Hydraulics Division, Vol 97, No HY1, Paper 7815, p 43-53, January 1971. 11 p, 1 fig, 1 tab, 37 ref.

Descriptors: *Sediment transport, *Sedimentary structures, *Classification, *Sediments, *Alluvium, Bed load, Rivers, Alluvial channels, Geology, Sedimentation, Sedimentology, Silts, Gravels, Sands, Sand bars, Deltas.
Identifiers: *Alluvium classification.

Valley fluvial sediment deposits are classified according to origin. All such deposits are intergradational, but most can be classified as dominantly transitory channel deposits, lag deposits, lateral or vertical flood plain accretions, splays, channel fill, or colluvium. Mass movements, especially mudflows but also debris avalanches and earthflows in places, form significant deposits under limited circumstances. Other terms are useful for typical surface forms, subdivisions or associations of types of deposits. Point bars are the most conspicuous forms of lateral accretion. Vertical accretion includes natural levee, backland and backswamp

deposits, although splays are also important in natural levees. Channel fills range from course-grained to fine clay plugs. Alluvial fans and deltas are associations of types of deposits, characteristic of specific topographic situations. Valley plugs are fan-like local concentrations along filled channels, with characteristic splays, but not in typical alluvial fan locations. (See also W71-03667) (Knapp-USGS)

TOPOLOGICAL AND GEOMETRICAL PROPERTIES OF BRAIDED STREAMS,
Virginia Univ., Charlottesville.
Alan D. Howard, Mary E. Keetch, and C. Linwood Vincent.
Water Resources Research, Vol 6, No 6, p 1674-1688, December 1970. 15 p, 6 fig, 3 tab, 27 ref.

Descriptors: *Braiding, *Alluvial channels, *Sediment transport, *Mathematical models, Regime, Channel morphology, Networks, Sediment load, Bed load, Deposition (Sediments), Distribution patterns.
Identifiers: *Topology (Channels).

Strong relationships among dimensionless properties of braided streams indicate that similarity is preserved in streams with the same average number of channels but of different sizes. The degree of braiding in streams, conveniently measured by the average number of channels bisected by lines crossing the channel, increases with the product of discharge and gradient, but decreases with higher variance in discharge. A random walk simulation model of braiding duplicates many of the numerical relationships observed in natural streams, suggesting that most of the downstream variation in the number of channels in braided streams is explainable by local fluctuations in discharge and sediment in transport, as apposed to large-scale factors such as valley constriction. Descriptors: *Waves (Water), *Turbulent flow, *Diffusion, *Sediment transport, *Hydraulic models, Turbulence, Diffusivity, Model studies, Beaches, Settling velocity, Suspension.
Identifiers: *Turbulent diffusion.

By oscillation of an array of turbulence-generating grids in still water, the turbulent fluid velocity field in shoaling waves near the bottom was simulated in a laboratory channel. Solid particles with fall velocities varying between 1 and 40 mm/sec were introduced into the test volume from above. Multiple-image photography recorded the grain trajectories. The Lagrangian intensities of turbulence and diffusion coefficients were directly measured from the photographic data. The scale times, scale lengths, and the frequencies of the power spectra modes can then be calculated. The turbulent velocity distributions of both fluid and heavy particles are Gaussian, and their standard deviations increase regularly with increasing grid Reynolds numbers. Diffusion coefficients also increase with increasing grid Reynolds numbers. Diffusivities of the heavy particles are a function of both particle fall velocity and the structure of the fluid turbulence. (Knapp-USGS)

Descriptors: *Sand waves, *Sediment transport, *Beaches, Waves (Water), Littoral drift, Currents (Water), Bed load, Sands, Surf, Ocean waves, Sedimentation, Topography, Sand bars, Sedimentary structures.
Identifiers: *Sand waves (Beaches).

Collective movements of sediment occur in the form of sand waves in the nearshore zone and affect beach topography to a significant extent. Bar-type sand waves move only in the onshore direction and account for various accretive profiles on the subaerial beach. When the beach is eroded, these sand waves are simply disintegrated on the subaerial beach, instead of migrating back in the form of sand waves. These characteristics of bar-type sand waves help explain dynamic behavior of beach profiles with respect to profile configuration, sediment storage, and beach width. Cusp-type sand waves are considered to be a product of interaction between longshore currents and an erodible bed. Their presence causes variability in beach profiles along the shore between those containing a prominent bar and those without a bar. Migrati
of these sand waves may well produce pulsatio
transfer of material along the shore. (Knap

Guernsey Reservoir (Wyo), Sediment deposits.

The 1966 sediment survey of Guernsey Reser
was made to determine the present reser
capacity and the quantity of sediment accumul
since the dam was closed in 1927. Present capa
of the reservoir is 45,228 acre-ft and the sur
area is 2,377 acres at normal water surface el
tion 4420 ft. The total volume of sediments a
mulated in the reservoir amounted to 28,582 a
ft below elevation 4420 ft. Sediments accumul
at an annual rate of 719 acre-ft between 1927
1966. Twenty-one sediment samples of reser
deposits were collected and a gamma probe
used to measure wet bulk densities of t
deposits at 20 reservoir ranges. Analyses of sam
collected in 1947, 1957, and 1966 showed
average unit weight of 54 lb/cu ft. Size analys
samples collected during the 3 surveys resulte
an average breakdown of 43% clay, 44% silt,
13% sand. A sonic depth recorder was use
make the hydrographic survey. The rese
capacity was computed on the basis of areas d
mined by a width ratio method.

The objective was to obtain a better understa
of the behavior of surfactants in aqueous solu
at electrodes. With this understanding it shou
possible to design electrochemical methods f
detection, identification, and quantitative
mination of such substances. This study was
cerned primarily with the influence of extra
salts on the behavior of surface active agents
these are examined by the electroche
technique known as tensammetry. The tensam

ethod consists essentially of the measurement
electrical impedance of an electrochemical
This impedance is characteristically increased
presence of surfactants at those potentials
the surfactants are absorbed on the elec-
At sufficiently negative and at sufficiently
e polarization, surfactants are absorbed, and
se absorption potentials, the impedance of
ell is decreased. Curves of admittance as a
on of polarization of the electrode therefore
y show two tensammetric waves. The extent
face activity is proportional to the separation
en the two tensammetric waves, to the
s of these waves, and to the degree to which
mpedance is increased at polarizations
en the two waves. Since tensammetric mea-
ents can be made only in solutions of suffi-
high conductivity, the nature and effects of
salts on the result obtained is a considerable
tance. In this study it was found that the salt
is relatively unimportant when the salt con-
tion is not greater than approximately 0.1 m.
oncentration might then be used as a stan-
condition for making measurements of the
tant concentration in aqueous solution. The
ability of the technique to the analysis of sur-
ctive agents under actual field conditions was
empted.

Ohio Journal of Science, Vol 70, No 3, p 170-179, May 1970. 10 p, 4 fig, 2 tab, 17 ref. OWRR Project No B-004-Ohio (2).

Descriptors: *Solutes, *Water quality, *Ohio, *Water chemistry, Surface waters, Calcium, Sodium, Potassium, Strontium radioisotopes, Limestones, Discharge (Water), Streamflow.
Identifiers: *Scioto River (Ohio), *Olentangy River (Ohio).

Concentrations of sodium, potassium, calcium, and strontium were determined in water samples collected from the Olentangy and Scioto Rivers at Columbus, Ohio, during 1966. The water samples were collected at weekly intervals throughout the year and were combined into four-week composites. The average concentrations in the Olentangy River (in units of micrograms/ml) were: Na, 22.3; K, 3.3; Ca, 72.4; Sr, 0.923. In the Scioto River the concentrations of these elements were: Na, 12.2; K, 3.6; Ca, 78.8; Sr, 1.91. In both rivers the concentrations of sodium and strontium decreased linearly with increasing discharge, whereas the concentrations of potassium and calcium did not. The concentration of potassium increased steadily during the summer and reached a peak in the fall. The Sr-87/Sr-86 ratio of the Olentangy River decreased with increasing discharge from 0.7116 to 0.7088 while that of the Scioto River appeared to be constant at 0.7093. (Knapp-USGS)

VACUUM UV ABSORPTION SPECTRA OF LIQUID WATER AND ICE,
Ryumyo Onaka, and Tsutomu Takahashi.
Journal of Physical Society of Japan, Vol 24, No 3, p 548-550, March 1968. 3 p, 5 fig, 18 ref.

Descriptors: *Water properties, *Absorption, *Spectroscopy, *Ultraviolet radiation, Crystallography, Hydrogen bonding, Physical properties, Spectrometers.
Identifiers: *Ultraviolet spectrometry (Water).

Fundamental absorption bands of ice and liquid water were studied. Cubic ice has a well-defined absorption band at about 8.7 eV, while hexagonal and amorphous ices show only a gradual increase of absorption intensity toward the higher energy in the range from 7 to 10 eV. Absorption coefficient of liquid water is found to comply with the Urbach rule at the low energy tail of the fundamental absorption. (Knapp-USGS)

SOLUBILITY AND DISSOLUTION RATE OF AMORPHOUS SILICA IN DISTILLED AND SEA WATER AT 20 DEG C,
Nagoya Univ. (Japan). Water Research Lab.
Kikuo Kato, and Yasushi Kitano.
Journal of the Oceanographical Society of Japan, Vol 24, No 4, p 147-152, August 1968. 6 p, 4 fig, 1 tab, 18 ref.

Descriptors: *Aqueous solutions, *Silica, *Water chemistry, *Sea water, *Solubility, Solutes, Hydrogen ion concentration, Chemical properties, Saturation, Salinity.
Identifiers: *Silica solubility.

The solubility of amorphous silica in sea water is about 85 mg per liter at 20 deg C, which is less than that in distilled water (about 113 mg per liter). The dissolution rate seems to be controlled by the amount of silica gel present and its solubility. Silica gel in sea water is transformed to dissolved silica at a much faster rate than in distilled water. A maximum value of dissolved silica is observed during the process of dissolution without abrasion, when the dissolution rate is very large. The differences in the solubility and in the dissolution rate of amorphous silica in distilled and in sea water cannot be explained by the difference in pH values of the waters but seem to be related to the salts present in sea water. GEOCHEMICAL STUDY OF GROUNDWATERS IN THE MATSUSHIRO AREA - PART 2: CHEMICAL COMPOSITION OF GROUNDWATERS,
Nagoya Univ. (Japan). Water Research Lab.
Yasushi Kitano, Ryuma Yoshioka, Setsuo Okuda, and Kazuo Okunishi.
Kyoto University Disaster Prevention Research Institute Bulletin, Vol 18, Part 1, No 133, p 49-58, May 1968. 10 p, 7 fig, 8 ref.

Descriptors: *Earthquakes, *Water quality, *Springs, *Water sources, *Water chemistry, Geology, Hydrogeology, Landslides, Water circulation, Aquifers, Groundwater, Groundwater movement, Geochemistry.
Identifiers: *Japan, *Matsushiro (Japan).

A hydrological survey and chemical analysis of groundwaters in the Matsushiro area between September 1966 and February 1968 was made to study chemical quality changes caused by the earthquakes of 1965. Water balance and chemical composition of groundwaters in the area show that groundwaters have a deep source and that they are not influenced by recent precipitation. There is a general tendency for the concentrations of calcium and chloride ions, among dissolved ions, to increase with time. A positive relationship between the activity of the swarm earthquakes, the amount and the concentration of the chemical composition of groundwaters in the area was observed. Many of the springs which gushed out accompanying the heavy earthquakes and landslides disappeared entirely after a decrease in their discharge, whereas large amounts of water are still discharging from some springs. STREAM TEMPERATURE STUDY, NORTH FORK SNOQUALMIE RIVER, WASHINGTON,
Washington Univ., Seattle. Charles W. Harris Hydraulics Lab.
E. Ronald Nece.
OWRR Project A-012-WASH (1). State of Washington Water Research Center, Completion Report, January 1968. 49 p, 10 fig, 4 tab, 11 ref. Technical Report No 23.

Descriptors: *Water temperature, *Micrometeorology, *Streams, *Solar radiation, *Air temperature, Hydrology, Groundwater flow.
Identifiers: *Stream water temperature, *Groundwater temperatures.

The upper basin of the North Fork of the Snoqualmie River was used to study stream temperatures in the headwater regions of a typical Pacific Northwest mountain River. One objective was to see if relatively simple calculation methods could be devised for formulating predictions of stream temperature in the upper reaches of such rivers. This involved consideration of the temperature of the groundwater flow. Measurements of air temperatures and of solar radiation in the test basin were performed and a check was made to verify the assumption that these variables may be predicted on the basis of conventional data obtained from regional weather stations. Field data obtained and attempts to develop a computational procedure for predicting stream temperature variations as function of assumed climatological conditions and streamflows are described. The question of transferral of some climatological data from one area to another was checked in more detail; results are presented and discussed. (Herrera-Vanderbilt)

SIGNIFICANCE OF SILICA IN THE LOSS OF MAGNESIUM FROM IRRIGATION WATERS,
California Univ., Riverside.
Frank M. Eaton, G. W. McLean, G. S. Bredell, and H. E. Doner.
Soil Science, Vol 105, No 4, April 1968, p 260-280. 10 tab, 3 fig, 53 ref. California Water Resources Center Project W202.

Descriptors: *Calcium, *Magnesium, *Silica, *Drainage water, *Irrigation water, Water quality, Chlorides, Runoff, Sulfates, Saline soil, Carbonates, Alkalinity, Ion exchange, Sodium, Solubility, Groundwater, California, Rio Grande, Silicates, Arid lands, Rivers, Chemical precipitation, Hydrogen ion concentration, Saline water, Surface waters, Water chemistry, Water analysis, Analytical techniques, Data collections, Electrical conductance.
Identifiers: *Soil solution, *River water.

In this article illustrations show that the tendency for Ca/Mg ratios in saline soil solutions and drainage waters in similar to those in irrigation supplies, though Cl concentrations may increase with runoff. Ca is lost to CaSO sub 4 and CaCO sub 3 precipitation while Mg is lost to silicates as an alkalinity and an ionization function through an increase in Na and CaCO sub 3 precipitation in the alkalinity source. Variations in SiO sub 2 solubilities in river and groundwaters as influenced by discharge, time and temperature are discussed for a California watershed. Tables show silica and average ionic concentrations in the Rio Grande drainage basin; silica, Cl and Ca/Mg ratios for selected sites; long term silica and electrolyte concentrations in California rivers; effects of HCO sub 3 and SiO sub 2 and Ca and Mg precipitation; serial additions of sodium nitrate and silicate effects; pH ranges on sodium carbonates and silicates; factorial summary of Mg losses; and sea water effects. Also included are figures of Mg solubilities in SiO sub 2, SiO sub 2 in Mg as influenced by pH, concentration and time, and solubilities of Mg and SiO sub 2 in MgCl sub 2 and Na sub 2 SiO sub 3. Identifiers: *Calcium activity, *Ion activity, Partial pressure.

The behavior of all soil-related Ca compounds is of vital interest to soil scientists, particularly those studying arid and calcareous soils. This paper reports on the different forms of Ca that may be in equilibrium with CaCO sub 3 with their appropriate dissociation or association constants. Constants related to each of the species are K sub 1 equals 0.0564 for the relation positively monovalent CaHCO sub 3 equals positively divalent Ca plus negatively monovalent HCO sub 3, K sub 2 equals 1.245 times 10 to the seventh for CaCO sub 3 plus positively monovalent H equals positively monovalent CaHCO sub 3, and K sub 4 equals 0.329 times 10 to the minus four for CaCO sub 3 equals positively divalent Ca plus negatively divalent CO sub 3. In saturated CaCO sub 3 solution under partial pressure conditions resembling that of atmospheric CO sub 2, suitable correction must be employed to get the actual positively divalent Ca concentration when the Ca activity cannot be measured directly. Activity, concentration and equilibrium values are given in tables. There are 9 equations and a plot of experimental data testing the estimation of the equilibrium equation. (Popkin-Arizona)

Geological Survey, Washington, D.C.; Geological Survey, Denver, Colo.
F. J. Pearson, Jr., and Irving Friedman.
Water Resources Research, Vol 6, No 6, p 1775-1781, December 1970. 7 p, 2 fig, 2 tab, 14 ref.

Descriptors: *Water chemistry, *Carbonates, *Groundwater, *Provenance, *Stable isotopes, Water sources, Recharge, Infiltration, Groundwater movement, Solutes, Aquifers.
Identifiers: *Long Island (NY).

Water from 14 wells in the Magothy aquifer, Long Island, New York, was sampled for chemical analysis and C-13/C-12 ratio measurements of the dissolved carbonate. The Magothy is essentially free of carbonate minerals and contains water whose chemistry is controlled by the chemistry of the atmospheric precipitation that recharged the aquifer. Wells near the recharge area have delta C-13 values of -2.5% and total carbonate contents corresponding to a PCO2 of about 0.004 atmosphere, showing that the carbonate here is derived from the soil zone. Downgradient, the total carbonate content doubles, but the delta C-13 values remain more negative than -1.8%. The dissolved carbonate increase is due in part to carbonate mineral solution but results largely from oxidation of lignite in the aquifer by oxygen dissolved in the water. (Knapp-USGS)

Identifiers: *Hele-Shaw models.

Model studies are used to verify theories in grou water flow systems. In complex cases, the mo studies may be extremely useful especially whe theoretical rigorous analysis does not exist. models cannot be considered entirely satisfact due to the several drawbacks in each type in ac tion to the normal human errors in experimer tion. This paper is concerned with viscous fl models. A brief summary of the other types models, which may be possibly be used in conn tion with salt water intrusion problems, is a given. Gravity flow systems are analogous to so phases of salt intrusion problems. Problems in fields bear general similarities to sea water int sion zones. In oil fields, gas cycling studies g valuable information to sea water problems. Mo studies are used by hydraulic engineers, geologi petroleum engineers, physicists, foundation gineers and several other professional groups. napp-USGS)

n C. Ludwick.
ilable from NTIS as AD-713 195, $3.00 in er copy, $0.95 in microfiche. Technical Report l, September 1970. 107 p, 32 fig, 57 ref. ONR Number NR388098.
tifiers: *Estuaries, Sand, *Tides, Chesapeake Sedimentation, Floods, Ocean waves, Fluid , Interactions, Hydrographic surveying, ythermograph data, Tidal channels, Shoal elopment.

l waves 5-12 feet in height and 200-1200 feet ngth occur in water 25-50 feet deep in the sand and tidal channel area of the entrance to sapeake Bay. Most waves are asymmetrical in sverse profile, some facing with ebb currents, rs facing with flood currents, depending which ominant at a given place. Steep slopes on the ous waves range from 4 deg to 31 deg and age 12 deg. The sand waves occur in associa- with tidal channels and especially on the flanks oals that form channel boundaries. Migration nd waves, judged from their facing direction, is d sediment transport mechanism by which sand oved up onto shoals. Many large shoals of the occur between ebb-dominated and flood- inated channels. This implies the existence of circulation loops of water and sediment in cells ted ober shoals. The action of such cells is to sediment. Other ebb-flood shear zones may sites of future shoaling in the entrance.

Descriptors: *Desalination, Waste disposal, Water sources, *Desalination plants, Heat, Environment, Environmental engineering, Ecology, Biological communities, *Coasts, Deserts, *Arid lands.
Identifiers: Waste heat utilization.

Of the world's 20,000 miles of arid coastline, a large percentage remains berefit of cultivation. Considerable portions of these sparse areas could be made productive if the basic amenities of life were present. On this premise, investigations were started in November 1966 on possible designs for an economical package for power-water-food production in such locations. An integrated, closed-environment system has been devised. Waste heat from engine-driven electric generator sets is used to desalt seawater. This fresh water, in turn, is utilized for the irrigation of vegetables planted within greenhouses of air-inflated plastic. High-quality vegetables have been grown in a pilot facility on the Gulf of California while planning has begun for the first large-scale installation--in the Arabian Peninsula Shaikdom of Abu Dhabi. The concept is believed to be widely applicable. (Novotny-Vanderbilt)

Descriptors: Desalination, *Membrane processes, *Electrodialysis, *Electrochemistry, Ion Exchange Membranes, Permselective Membranes, Ion transport, Scale prevention, Scale deposition.
Identifiers: Membrane fouling, Membrane scaling.

The main objectives of the experiments described were the detailed observation of the fouling of anionselective membranes by colloids, the understanding of the mechanism of this phenomenon and, if possible, its elimination or alleviation. The fouling characteristics of various existing membranes as well as synthesized new ones were determined in an effort to find membranes that would be less prone to fouling. Bimolecular leaflet membranes were examined to give a better understanding of the phenomena occurring on the surface of membranes. (Kindley-Office of Saline Water)

3B. Water Yield Improvement

ON ICE NUCLEATING PROPERTIES OF DIFFERENT FACES OF SILVER IODIDE CRYSTALS,
Nagoya Univ. (Japan). Water Research Lab.
K. Isono, and Y. Ishizaka.
Journal de Recherches Atmospheriques, Vol 3, p 139-140, 1968. 2 p, 1 fig, 1 ref.

Descriptors: *Chemistry of precipitation, *Cloud seeding, *Crystallography, *Nucleation, *Silver iodide, Ice, Supercooling, Freezing, Condensation, Crystal growth, Crystals.
Identifiers: Supercooled clouds.

To clarify the mechanism of ice nucleation, experiments were conducted on ice nucleation on silver iodide films and particles. Specimens of silver iodide films to be used were examined with an electron microscope to determine crystal structures before experiments. Each sample of silver iodide film was mounted on a copper rod cooled with a Peltier element. Temperature and dew point on the surface of the samples were controlled. Below -8 deg C and below water saturation, ice crystals were nucleated on prism faces of AgI, whereas above water saturation ice crystals were nucleated from supercooled water droplets on both basal and prism faces, preferentially on the basal. The silver iodide films were deposited on the basal plane of muscovite crystals with special care that most films

were so orientated that their basal faces were parallel to the basal faces of muscovite. (Knapp-USGS)

EFFECTS OF A MONOLAYER ON RESERVOIR TEMPERATURE AND EVAPORATION,
Army Electronics Command, Fort Huachuca, Ariz. Atmospheric Science Lab.
Jon F. Bartholic, Jack R. Runkles, and Ernest B. Stenmark.
Water Resources Research, Vol 3, No 1, p 173-179, First quarter 1967. 3 fig, 1 tab, 12 ref.

Descriptors: *Water temperature, *Evaporation control, *Monomolecular films, *Reservoir evaporation, Water conservation, *Temperature, Water balance, Energy budget, Mass transfer.

Since a considerable portion of the available supply of water is stored in reservoirs, emphasis has been placed on preserving this water for future use. It is the purpose of this paper to evaluate the effectiveness of a monolayer in retarding evaporation from the surface of a reservoir by means of three approaches, such as: the water-budget method, the energy-budget, mass-transfer method and the U. S. Bureau of Reclamation simplified method (U. S. B. R.). The application of a monolayer to a reservoir water surface to reduce evaporation showed a relative rise in the water temperature not only at the surface, but also at greater depths. It is stated that this increase in temperature must be accounted for in predicting the reduction in evaporation by monolayers. Neglecting this change in temperature, the corresponding change in vapor pressure and using only the temperature actually measured after film application, results in evaporation reduction estimates by the U. S. B. R. simplified method, which estimates are found to be 8 to 14% too large. (Herrera-Vanderbilt)

POSSIBLE EFFECTS OF PRECIPITATION MODIFICATION ON STREAM CHANNEL GEOMETRY AND SEDIMENT YIELD,
Pennsylvania State Univ., University Park.
Albert Rango.
Water Resources Research, Vol 6, No 6, p 1765-1770, December 1970. 6 p, 1 fig, 3 tab, 11 ref. Bur of Reclamation Contract 14-06-D-6467.

Descriptors: *Weather modification, *Rainfall-runoff relationships, *Channel morphology, *Sediment yield, Sediment transport, Bed load, Scour, Stream erosion, Suspended load, Data collections, Hydrologic data, Regression analysis, Simulation analysis, Mathematical models, Sampling, Discharge (Water).
Identifiers: *Channel geometry.

Stream channel geometry data were collected on 18 small watersheds in the West and sediment yield data were obtained for 673 small watersheds across the United States. Regression analysis was used to test what effects precipitation modification might have on these watershed parameters. No consistent changes of stream channel geometry between watershed areas were obtained, but the results indicated that the stream channel at a given location would adjust significantly in response to increases in precipitation (amounting to 14% annually). This response would probably initiate increased stream channel erosion. Sediment yield will increase substantially in semiarid regions with increasing precipitation until about 27 inches mean annual precipitation; at this point vegetation growth as a result of increased precipitation will begin to reduce sediment yield. Significant changes in stream channel geometry and sediment yield may result in sufficient economic damage to nullify many of the beneficial effects of weather modification. (Knapp-USGS)

CHANGING AGRICULTURAL PRACTICE IN AN ARABIAN OASIS; A CASE STUDY OF THE AL'AIN OASIS, ABU DHABI,
Durham Univ. (England). Dept. of Geography.
J. H. Stevens.
Geographical Journal, Vol 136, No 3, p 410-418, September 1970. 3 fig, 10 ref.

Descriptors: *Irrigation practices, *Arid lands, *Regional analysis, *Social impact, *Economic impact, Cultivated lands, Crop production, Forages, Dates, Trees, Economic efficiency, Climatic data, Hydrologic data, Soil types, History, Social adjustment, Area redevelopment, Social change, Agriculture, Seasonal, Resource development, Irrigation water, Vegetable crops, Diversification.
Identifiers: *Trucial states, *Abu Dhabi, *Oases, *Underdeveloped lands, *Agricultural evolution, Africa, Oasis agriculture.

Abu Dhabi is one of the 7 Trucial states and has a large national income from oil. Major development projects have concentrated on communications, industry and municipalities. However, due to an increasing population and greater national wealth, the agricultural sector has increased in size and has become more diversified and more commercially oriented. Most of the agriculture is concentrated around a few small strings of oases and expansion has been through the drilling of irrigation wells in these areas. The traditional small data gardens (less than 1 ha) have been surrounded by many small holdings (20-25 dunnums) and several large units (15-100 ha). This has been accompanied by crop diversification into income-yielding vegetables and forages (mainly lucerne). The rather swift agricultural changes have been accompanied by some social consequences - seasonal market gluts of vegetables, inefficiencies due to ignorance of modern agricultural techniques and increa spread of human and plant disease vectors du increased irrigation. Nevertheless it appears the transition from the traditional economy is gely successful. (Casey-Arizona)

Identifiers: *Africa, *Pastoral cultures, *Noma cultures, *Wildlife harvesting, Tsetse flies.

A modern paradox is that while man, at leas Africa, systematically eliminates native wildlif the process of agricultural development, hardly natural areas have been destroyed by wildlife. tually every area inhabited by man and domestic animals has been methodically and s ously damaged. Three types of African grassla are distinguished on the basis of rainfall. Agri tural activities in each area must vary becaus differing productivities. Highest rainfall areas 40 ins/yr) are also the highest agricultural pro tivity areas and elimination of most wildlif probably justified. However, inefficient cultiva and soil conservation practices in these areas to the shifts in human population to lower rai areas and consequent destruction of vital wil habitats. It is argued that crucial economic fac are ignored in exploitation of low-rainfall ar Because of adaptation to a wider variety of pla more efficient water conservation mechani greater disease resistance and adaptive popula restriction mechanisms, which avert overgra wild animals may be more economical po producers than domestic animals. Nomadic p tices in arid regions, systematic wildlife harves elimination of expensive tsetse fly eradication grams and more realistic economic evaluation suggested. (Casey-Arizona)

RROW WATERSHEDS,
Agricultural Experiment Station, College n.
Mulkey, Jr.
A and M University, Texas Agricultural Ex- ent Station, Progress Report 2619, 1968, p 7- ig, 2 tab.

iptors: *Agricultural watersheds, *Planting gement, *Water utilization, *Cotton, *Crop ction, Water conservation, Water manage- (Applied), Texas, Rainfall, Soil moisture, ation, Soil-water-plant relationships, Arid lands, Small watersheds, Dry farming, Fallowing, Fibers (Plant), Spatial distribution, Moisture availability, Data collections, Surface runoff.
Identifiers: *Interrow watersheds, *Skip-row planting, *Fallow rows, Texas Rolling Plains, Semiarid lands.

Establishing interrow watersheds in skip-row planted cotton was investigated at Chillicothe, Texas, from 1965 to 1967. Cotton lint yields increased 151 pounds per acre in normal rainfall years when planted in two fallow rows, in a two in-two out skip row pattern. The rows were ridged and covered with a plastic fabric, forming an interrow watershed. Interrow watersheds increased available soil moisture in the Texas Rolling Plains. Available water is the most limiting factor for producing cotton fiber in arid and semiarid lands. Figures show dryland cotton under conventional and interrow watershed cultivation. Tables include rainfall and lint yield data. (Popkin-Arizona)

THREE METHODS OF WATER CONSERVATION FOR DRYLAND COTTON PRODUCTION,
Texas Agricultural Experiment Station, College Station.
P. T. Marion.
Texas A and M University, Texas Agricultural Experiment Station, Progress Report 2620, 1968, p 10-12. 3 fig, 1 tab, 3 ref.

Descriptors: *Cotton, *Land forming, *Water conservation, *Crop production, *Dry farming, Land management, Contour farming, Slopes, Soil-water-plant relationships, Texas, Terracing, Soil moisture, Soil water, Runoff, Water utilization, Bench leveling, Contour furrows, Depth, Moisture availability, Agricultural watersheds, Water management (Applied).
Identifiers: *Cotton lint, *Row spacing, Border spacing, Semiarid lands.

The Texas A. and M. University Research Station at Spur has used several water conservation methods since 1927. Closed-end contour terraces, which hold all the water that falls on the land, were compared with contoured rows and sloping rows. Contour terracing increased available moisture and lint cotton yield. Land leveling between terraces increased crop production. Runoff water utilization of leveled terraces effected the greatest crop production increase. Bench leveling using parallel borders (8 to 16 rows apart) produced a uniform crop without increasing available soil moisture or cotton lint yield. Close border spacing was a disadvantage. A new parallel terrace system was constructed with terraces spaced 64 rows apart on leveled land. The crop was more uniform and field work was facilitated, although there was no increase in crop production. Figures show effect of depth of soil moisture at planting time, uniform water spread and crop production over a leveled terrace. A table compares parallel leveled terracing, contour non-leveled terracing and contributing level watershed in terms of total acreage, planting pattern and lint yields. (Popkin-Arizona)

STRAW MANAGEMENT-NITROGEN TREATMENT INVESTIGATIONS IN THE CONTINUOUS PRODUCTION OF IRRIGATED WINTER WHEAT,
Southwestern Great Plains Research Center, Bushland, Tex.
John Shipley, J. S. Wehrly, and Cecil Regier.
Texas A and M University, Texas Agricultural Experiment Station, Progress Report 2706, October 1969. 17 p, 1 fig, 7 tab, 6 ref.

Descriptors: *Crop production, *Wheat, *Nitrogen, *Soil-water-plant relationships, *On-site investigations, Burning, Fertilization, Texas, Sampling, Treatment, Irrigation water, Infiltration, Organic matter, Weight, Proteins, Soil analysis, Economic feasibility, Crop response, Farm management, Soil aggregates, Data collections.
Identifiers: *Straw management, *Irrigated crops, *Soil working, *Mechanical removal, Replications, Semiarid lands, Plots.

A 15-year study began at Etter, Texas, in 1964 to test long-range effects of removing straw from land cropped continuously to irrigated winter wheat. Results from 1965 to 1969 are discussed. Three straw management treatments and 2 replications were applied, including straw working into soil, mechanical removal (simulated bailing) and burning. Treatment plots contained 12 subplots, where 6 nitrogen rates were replicated twice and randomized. Worked-in, removal and burning treatments produced 41.6, 44.5 and 46.8 bushels per acre. Yields from burning and removal treatments were significantly higher than incorporation treatments. Yields did not respond to nitrogen fertilizer, though effects of airborne waste products from a nearby ammonium nitrate plant were probable. Figures and tables show wheat straw yield, treatment, infiltration rate, protein analysis, and soil sample analysis. (Popkin-Arizona)
W71-03488

THE EFFECT OF ROW SPACING AND PLANT POPULATION ON IRRIGATED CORN PRODUCTION,
Texas Agricultural Experiment Station, College Station.
K. B. Porter, G. W. Grogan, G. L. Peterson, and W. W. Watson.
Texas A and M University, Texas Agricultural Experiment Station, Progress Report 2724, February 1969, p 22-29. 3 tab.

Descriptors: *Plant populations, *Corn (Field), *Crop production, *Grains (Crops), *Spatial distribution, Forages, Texas, Irrigation efficiency, Weight, Water conservation, Sampling.
Identifiers: *Row spacing, *Irrigated crops, *DeKalb XL 45, *Texas 40, *Ear weight, Plots, Semiarid lands, Texas High Plains.

Optimum row spacings and plant populations for growing irrigated corn on the Texas High Plains were investigated. DeKalb XL 45 averaged 98.6 bushels per acre, regardless of plant population factors of 18, 24 and 30 thousand plants per acre. Texas 40 averaged 80.4 for 18, 57.9 for 24, and 51.8 bushels per acre for 30 thousand plant populations. Row spacings did not greatly affect grain yield. Texas 40 forage production was not affected by row spacing or plant population, though 40-inch spacing produced greater ear weight than did narrower spacings. Greater forage ear weights were produced from 18 thousand plant populations than higher populations. Tables show row spacing and plant population effects on grain yield and forage production for irrigated corn in the 1969 tests at Bushland, Texas. (Popkin-Arizona)

CORN IRRIGATION FIELD STUDY IN MULESHOE AREA, 1969,
Texas Agricultural Experiment Station, College Station.
Leon New.
Texas A and M University, Texas Agricultural Experiment Station, Progress Report 2725, February 1969. 4 fig, 1 tab.

Descriptors: *Corn (Field), *Irrigation practices, *Irrigation efficiency, *Crop production, *Water management (Applied), Moisture stress, Growth stages, Consumptive use, Soil-water-plant relationships, Texas, On-site investigations, Timing, Rates of application, Leaves, Frequency, Variability, Sampling, Analytical techniques, Soil moisture, Spatial distribution, Depth, Data collections, Rainfall, Water requirements.
Identifiers: *Row irrigation, *Growing season, Mixed soils, Texas High Plains, Semiarid lands.

Corn irrigation was investigated in 9 fields in the Muleshoe, Texas, area during the 1969 growing season to determine irrigation management in-

fluence. Number, amounts and timing of irrigation were evaluated to find important management guides for High Plains growers seeking to improve irrigation efficiency in corn production. Three irrigations applied between the 10 leaf growth and the milk stage of kernel development produced the highest yields. Water application allowed only limited to zero moisture stress during growth stages. Highest average yield was 1,835 pounds per irrigation with 4 irrigations. The number of irrigations varied from 4 to 7 and yields from 6,800 to 8,700 lbs./acre. Alternate row irrigation can be used in mixed soils to speed up water application frequency. The timing of irrigation is more important than the amount of water. Tables and figures show number and amount of irrigation and yield and effects of timing, number and depth of irrigation. (Popkin-Arizona)

AN IRRIGATION TREATMENT-YIELD STUDY WITH CORN GROWN ON THE TEXAS HIGH PLAINS,
Texas Agricultural Experiment Station, College Station.
O. C. Wilke, and R. R. Allen.
Texas Agricultural Experiment Station, Texas A and M University, Progress Report 2726, February 1970. 9 p, 2 tab, 2 fig, 1 ref.

Descriptors: *Corn (Field), *Irrigation effects, *Crop production, *Moisture stress, *Soil-water-plant relationships, Growth stages, Irrigation efficiency, Moisture tension, Irrigation practices, Crop response, Plant growth, Soil moisture, Moisture availability, Tensiometers, Texas, Arid lands, Data collections, Treatment, Clay loam, Plant populations, Leaves, Moisture content.
Identifiers: *Maximum yields, Texas High Plains.

Corn (DeKalb XL45) planted in 30-inch rows in Pullman clay loam at Bushland, Texas, was subjected to 9 different irrigation treatments based on stage of plant development. Plant populations and moisture regimens were not optimum for maximum yields. Moisture stress during the silking and pollination period was most injurious to yields. Visual symptoms of stress--crinkling of leaf edges and dying of lower leaves--were apparent in some instances when the soil water content in the top 4 feet of soil was 28 to 30 percent by volume. Soil moisture tensiometers operated satisfactorily in the Pullman clay loam at soil moisture tensions less than 70 centibars. To obtain maximum yields of corn, the soil moisture tension at the 12-inch depth should be less than 70 centibars. Data was not sufficient to verify Taylor's root-zone soil moisture tension of 50 centibars for maximum corn production. Tables and figures show corn irrigation treatments and yields; effect on stage of plant development of yield response and irrigation efficiency; stress days versus corn yield and changes in soil moisture tensions on dryland and irrigated corn with time. (Popkin-Arizona)

CORN DATE-OF-PLANTING AND IRRIGATION TIMING STUDY,
Texas Agricultural Experiment Station, College Station.
John Shipley, and Cecil Regier.
Texas Agricultural Experiment Station, Texas A and M University, Progress Report 2727, February 1970. 7 p, 4 tab, 2 ref.

Descriptors: *Corn (Field), *Timing, *Growth stages, *Irrigation effects, *Crop response, Soil-water-plant relationships, Irrigation practices, Crop production, Plant growth, Moisture stress, Smuts, Texas, Mature growth stage, Irrigation water, Rates of application, Water requirements, Water utilization, Data collections, Planting management, Consumptive use, Flexibility, Varieties, Scheduling.
Identifiers: *Texas High Plains, Limited irrigation, Hybrids.

Three hybrid corn varieties (DeKalb XL 45, Agrow 204, Texas 40), each representing a different maturity group, were evaluated under 3 different irrigation timing schedules based on growth stage on 4 separate planting dates (1 April, 15 April, 1 May, 19 May). The relatively low yields can be explained partly by moderate to severe moisture stress experienced by all groups during the silking-pollination period and by the smut in some varietal subplots. Although this report covers only one year's results, the data indicate that irrigated corn can be produced over a wide range of planting dates in the High Plains. This range permits corn and grain sorghum to be compatible under limited irrigation water conditions. If the 5 post-plant irrigations scheduled in this study are assumed to be accurate, results justify application of irrigation water when the variety reaches the growth stage specified. Tables present yields of several hybrids under various irrigation timing schedules, general agronomic data, number of days to reach specified growth stages and stages of growth versus period of high consumptive water use. SEEPAGE IN MISSISSIPPI RIVER BANKS; REPORT 1, ANALYSIS OF TRANSIENT SEEPAGE USING VISCOUS FLOW MODEL AND NUMERICAL METHODS,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
C. S. Desai.
Sponsored by U. S. Army Engineer Division, Lower Mississippi Valley. U. S. Army Waterways Experiment Station, Vicksburg, Mississippi, Miscellaneous Paper S-70-3, February 1970. 54 p, 2 app, 18 fig, 21 ref.

Descriptors: *Seepage, *Mississippi River, *Ba stability, *Numerical analysis, Viscous fl *Model studies, Slope stability.
Identifiers: *Finite element method.

Design of stable riverbank slopes along Mississi River is dependent upon seepage conditions wit the banks. Because available seepage analyses not adequate for determining changing free-wa surface, a parallel plate viscous flow model constructed, tested, and found to be a relia means of obtaining the transient free surface wit a sloping bank. Two series of model tests were p formed using a vertical upstream face and an stream slope of 45 deg. Because experime results are suitable only for simple boundary co tions and for homogeneous banks, some analyt techniques were developed for use with more co plex conditions. The finite difference and the fi element methods provide efficient numer techniques for obtaining numerical soluti There was good agreement between the two w comparing numerical results with those obtai from experiments with the model. Basic form tion of the finite element method was develo and is included in this report. (Spivey-WES)

E ROLE OF TVA RESERVOIRS IN REDUC- FLOOD CRESTS ON THE LOWER OHIO D MISSISSIPPI RIVERS,
nessee Valley Authority, Knoxville. Procedures elopment Section.
sell L. Tucker.
Proceedings Water Resources Conference, Mis- ppi State University, State College, April 14- 1970, published by Mississippi State Univ ter Resources Research Institute, p 47-73, 0. 27 p, 10 plate, 1 tab, 8 ref. OWRR Project A- -MISS (6).

Descriptors: *Flood control, *Reservoir operation, *Tennessee Valley Authority Project, River forecasting, Flood damage, Economics, Tennessee River, Water management (Applied), Ohio River, Mississippi River.

TVA reservoirs have a significant role in reducing flood crests on the lower Ohio and Mississippi Rivers. They have effected crest reductions of over 3 feet. Direct flood damages already prevented total over $43,000,000, and additional protection is afforded to 6 million acres of productive land protected by downstream levees. Meeting demands for increased effectiveness in flood control requires improved meteorological forecasts and the development of even more effective operating procedures. (See also W71-03380). FLOOD REGULATION BY COLUMBIA TREATY PROJECTS,
Corps. of Engineers, Portland, Oreg. Water Control Branch.
Mark L. Nelson, and David M. Rockwood.
ASCE Proceedings, Journal of the Hydraulics Division, Vol 97, No HY1, Paper 7798, p 143-161, January 1971. 19 p, 12 fig, 1 tab, 9 ref.

Descriptors: *Flood control, *Historic flood, *Columbia River, *Treaties, *International Joint Commission, Peak discharge, Dams, Reservoirs, Regulation, Routing, Flood routing, Streamflow forecasting, Water management (Applied), Reservoir operation, Systems analysis.
Identifiers: *Columbia River Treaty.

Reservoir regulation by Columbia Treaty Projects, in conjunction with existing U. S. Columbia Treaty Projects, should provide assured control of major floods to reasonably safe levels. A flood control operating plan for the Treaty Projects was developed in accordance with Treaty requirements. This paper describes the flood characteristics of the Columbia River, the principles of flood regulation, and the methods used in developing the flood control operating plan. Results of flood regulation studies for the period 1929-1958, together with the flood of 1894, the maximum flood of historic record, are presented. (Knapp-USGS)

SOME EXTENSIONS OF TWO-STREAMS STORAGE MODEL,
Lancaster Univ., Bailrigg (England).
A. A. Anis.
Journal of Hydrology, Vol 11, No 4, p 363-378, November 1970. 16 p, 3 ref.

Descriptors: *Water storage, *Reservoir design, *Streamflow forecasting, Probability, Statistical methods, Mathematical studies, Time series analysis, Markov processes, Stochastic processes, Statistical models.
Identifiers: *Reservoir storage forecasting.

Methods are given for calculating reservoir storage probability when two streams of water meet in a joint path but technical difficulties prohibit building a dam on the joint path. The respective inputs are mutually independent, non-seasonal, and without any serial correlation structure. The reservoir is to be managed in such a way as to maintain a given minimum flow below the confluence. The probability of emptiness of the dam before filling completely may also be obtained. This two-stream model is formally equivalent to a single stream model with unit release and a modified input. (Knapp-USGS)

WATER FOR ILLINOIS - A PLAN FOR ACTION.
Illinois State Technical Advisory Committee on Water Resources, Springfield.

Springfield, Ill, March 1967. 452 p, 201 fig, 5 map, 2 illus, 152 photo, 83 tab, 3 chart, 95 ref.

Descriptors: *Water resources development, *Water supply, *Water pollution, *Illinois, State governments, Water resources, Water management (Applied), Water conservation, Water control, Water costs, Water delivery, Water demand, Water policy, Water quality, Water requirements, Water storage, Water treatment, Water utilization, Water loss, Water purification, Watershed management, Federal government, Administrative agencies, Cities, Recreation demand.

This comprehensive study of available Illinois water resources and plans for development defines water resources planning as 'the consideration of alternative uses of the resource to meet future problems and opportunities and to establish priorities for action.' Primary subdivisions of the work are: (1) water resources, (2) water supply and use, (3) pollution and pollution control, (4) land and water management, (5) floods and flood control, (6) navigation, (7) water related recreation, and (8) laws and government. Specific conclusions and recommendations are set forth at the conclusion of each chapter. In the last chapter, the relationships between federal, state, and local government are examined, with special emphasis upon federal assistance for the various projects. The committee concludes that $1 billion is necessary for the program, as follows: water-related recreation--$200 million; pollution control--$350 million; flood control--$100 million; and water management--$350 million. The study is replete with graphs, charts, maps and photographs. (Hart-Florida)

4B. Groundwater Management

DELINEATION OF GROUNDWATER FLOW SYSTEMS IN NEVADA,
Nevada Univ., Reno. Center for Water Resources Research.
Martin D. Mifflin.
Available from NTIS as PB-196 657, $3.00 in paper copy, $0.95 in microfiche. Desert Research Institute Technical Report Series H-W, Publication No 4, Nevada Univ Water Resources Research Center, July 1968. 111 p, 13 fig, 2 plate, 2 tab, 206 ref, append. OWRR Project A-009-NEV (1), A-001-NEV (1), and B-006-NEV (1).

Descriptors: *Groundwater movement, *Nevada, *Aquifers, *Groundwater basins, Transmissivity, Recharge, Discharge (Water), Water sources, Water yield, Phreatophytes, Surface-groundwater relationships, Model studies, Flow nets, Potential flow, Hydrogeology, Water chemistry, Water temperature, Hydrologic data, Data collections.
Identifiers: Groundwater flow systems (Nev).

Available hydrologic and geologic information was studied using flow system theory in an attempt to delineate groundwater flow systems in Nevada with definition of sink areas, source areas and configuration of flow within the flow system as the primary objective. Source areas and configuration of flow were approximated in most areas. Sink areas have been confidently located for nearly all of the flow systems. Several types of fluid potential measurements are demonstrated to be the optimal methods of delineating groundwater flow systems. Changes in fluid potential in the vertical direction establish source areas, zones of lateral flow, sink areas and boundaries of circulation cells. Groundwater temperature was used to establish apparent depth of circulation. Characteristics of large springs in the carbonate rock province of Nevada, including water chemistry, water temperature, variation in discharge, tritium concentrations and C-14 determinations, have aided flow system delineation. Interbasin flow is closely related to bedrock permeability and availability of moisture for recharge. In nearly every area where interbasin flow has been recognized, there is also relatively permeable bedrock. In most areas of interbasin flow, only limited moisture is available for recharge. GROUNDWATER IN UNCONSOLIDATED SEDIMENTS - RECENT DEVELOPMENTS IN NEW SOUTH WALES,
Water Conservation and Irrigation Commission (Australia).
W. H. Williamson.
In: Proceedings of Groundwater Symposium, New South Wales University, Manly Vale, Australia, August 28-29, 1969: New South Wales University Water Research Laboratory Report No 113, Paper No 1, p 1-12, April 1970. 12 p, 1 fig, 5 ref.

Descriptors: *Water resources development, *Hydrogeology, *Alluvium, Surface-groundwater relationships, Irrigation water, Water yield, Reviews, Surveys.
Identifiers: *Australia, *New South Wales.

There has been a marked increase in the development of the groundwater resources of unconsolidated sediments in New South Wales, Australia in recent years. The causative factors, including the discovery of hitherto unknown resources and the trend to large diameter bores, are reviewed. The acreage irrigated with groundwater has expanded rapidly, particularly since about 1964. In 1967-68, about 97,000 acres were irrigated, an increase of about 12% over irrigation in 1966-67. DRILLING-MUD LUBRICITY,
National Lead Co., Houston, Tex. Baroid Div.
T. C. Mondshine.
Oil and Gas Journal, Vol 68, No 49, p 70- December 7, 1970. 5 tab, 4 ref.

Descriptors: *Drilling fluid, *Drilling, Oil indus Mud.
Identifiers: *Mud lubricity tester, *Lubricity coe cient, Drill string lubrication, Drilling mud ac tives.

Unless the drilling fluid provides adequate lubri tion, considerable friction exists when a drill str is rotated against a borehole or walls of a ca hole. These frictional forces are especially high directional or crooked holes, and may result in cessive torque when the string is rotated, or in cessive drag when the drill string is pulled from hole. Many drilling mud additives are used reduce torque and drag. The overall performan of many of these materials as drilling mud lub cants is doubtful. Laboratory studies were initia to investigate drilling mud lubricity which primar involves the rubbing of drill pipe and bit against borehole during rotation and tripping. A m lubricity tester simulates drill-pipe rotation a load and measures frictional force. The step-b step procedure of testing the lubricity of drilli mud is listed. In order to simulate various con tions of drillpipe speed and load, tests were co ducted at loads of 240, 480, and 720 psi, and at 120, 240, and 360 rpm. The force needed to itiate movement (static) was measured also at the loads. The coefficient of friction was measured each of these conditions using water and a typi drilling mud field sample. The results are given tabular data. (Campbell-NWWA)

FISHING IS MORE ART THAN SCIENCE,
Forest Oil Corp., Midland, Tex.
E. W. Porter.
Oil and Gas Journal, Vol 68, No 38, p 95-96, Se tember 21, 1970. 1 fig.

Descriptors: *Drilling, *Drilling equipment, Oil i dustry.
Identifiers: *Fishing, *Mechanical equipme failure, Down-hole problems, Human error, Coll inspection, Service factor, Aluminum drill pip Sluffing conditions, Excessive torque, Overshot Grapples.

The art of fishing, broadly defined as the attempte recovery of any item from a well which prohibi the continued progress of the desired operation undoubtedly only very little younger than the art drilling. Drilling has progressed to a science, b fishing remains as it started, an art. The causes fishing jobs fall into 3 main categories: mechanic failure of equipment, downhole problems related hole conditions, and human errors. Each cause ca be minimized, but it is important to realize tha economics and time must always be considered The normal practice in safeguarding agains mechanical failure is limited to the inspection drill pipe and collars. The problems in hole cond tion which create fishing jobs relate primarily t unstable formations. These are generally controlle with one or more of the many mud systems availa ble. In evaluation of preventive measures to pro vide hole stability, the time factor must be con sidered. Human error continues to remain a majo factor in causing fishing jobs. The best chance o avoiding a fishing job lies in good job plannin based on the best available data; in the ability to an ticipate problems; and in good communications (Campbell-NWWA)

SIDER LOST CIRCULATION IN WELL NNING, RIG SELECTION,
il Oil Corp., New Orleans, La.
Kerr.
nd Gas Journal, Vol 68, No 38, p 92-94, Sep-er 1970. 2 fig.

riptors: *Drilling, *Rotary drilling, Drilling pment, Oil industry.
tifiers: *Lost circulation, *Rig selection, *Well ning, Formation pore pressures, Fracture ients, Mud loss, Lost circulation recognition.

circulation continues to be a serious drilling lem. Sufficient occurrences can double the of an oil well. Improved drilling technology has a significant impact on the problem. The ability lculate formation pore pressures and fracture ients has done much to reduce the frequency st circulation problems. Using the minimum weight required to control the formation pore sure will not only speed drilling but will also t in less mud loss. Lost circulation can be clas-d as: (1) seepage loss to highly permeable, mented, shallow sands, gravel or shell beds, or lar limestone, (2) sudden complete loss to rnous formation and (3) partial or complete to natural or induces fractures. This is the most blesome type. (Campbell-NWWA)

RELATION BETWEEN AQUIFER PERMEABILITY AND IMPROVEMENT ACHIEVED BY WELL STIMULATION,
Louis Koenig-Research, San Antonio, Tex.
Louis Koenig.
American Water Works Association Journal, Vol 53, No 5, p 652-670, May 1961. 22 ref.

Descriptors: *Water wells, *Water yield improvement, Specific capacity, Coefficient of permeability, Oil industry.
Identifiers: *Permeation factor, Equilibrium radial flow, Fracturing, *Improvement ratio, Poiseuille Law.

The article states that variation in permeability of aquifers has certain bearing on improvement achieved by well stimulation. The relation is defined in numerical terms and suggests that improvement ratios achieved by every type of treatment decrease with increases in permeation factor. Methods are discussed which offer increases in permeability of various types of well stimulation. Some of the techniques used in the petroleum industry can be adapted to the groundwater industry. (Campbell-NWWA)
W71-03840

CLEANING METHODS FOR DEEP WELLS AND PUMPS,
Board of Water and Light, Lansing, Mich.
Claud R. Erickson.
American Water Works Association Journal, Vol 53, No 2, p 155-162, February 1961.

Descriptors: *Water wells, *Municipal wells, Pumps, Pump testing, Well screens, Corrosion.
Identifiers: *Deep well cleaning, *Stimulation, Redevelopment, Inefficient pump operation, Scale deposits, Static water level.

Two factors which are extremely important to the efficient operation of a well are: (1) stimulation, or redevelopment-of the well when it has declined in productivity, and (2) the cleaning and, if necessary, reconditioning of the pump. The article assumes four basic causes of declines in well production: (1) lowering of the static water level, (2) inefficient pump operation caused by worn, corroded, or plugged parts, (3) deposits of scale, corrosion products, and microorganism growths in the well screen area and on the face of the producing formation, and (4) fouling of the well screen area by mud, sand and silt. Reconditioning of the well and pump can aid in recovering lost production if the decline is due to any of the last three causes. (Campbell-NWWA)

SURVEY AND ANALYSIS OF WELL STIMULATION PERFORMANCE,
Louis Koenig-Research, San Antonio, Tex.
Louis Koenig.
American Water Works Association Journal, Vol 52, No 3, p 333-350, March 1960.

Descriptors: *Water wells, *Water yield improvement, Oil industry, Recharge.
Identifiers: *Well stimulation, Specific capacity improvement, Water well hydraulics, Oil well hydraulics.

The results of a study of 870 water well stimulation cases in 141 counties of 24 states are discussed. For all types of treatment in all types of formations median ratio indicates 97% improvement over specific capacity immediately before treatment and 20% improvement over original productions of water well. Treatment failures amounted to 11% with success being greater in consolidated formations than in unconsolidated formation. The study is based on the assumption that a close similarity exists between the technology of crude-oil production and the technology of groundwater production. (Campbell-NWWA)

DRILLING POROSITY LOG PROVES ACCURATE,
J. L. Kennedy.

Oil and Gas Journal, Vol 68, No 34, p 53-55, August 24, 1970. 2 fig.

Descriptors: Logging (Recording), Drilling, Porosity, Boreholes, Drill holes, Geologic formations, Radioactive logging.
Identifiers: Drilling data, Drilling costs, Optimum drilling conditions, Computer use, Rock properties, Bit performance, Pore pressure, Gulf Coast formations, Bulk density logging, Pseudodensity.

Continued refinement in the use of drilling data has been a big factor in keeping oil drilling costs within reasonable limits as materials and labor expense continue to climb. One big hurdle was developing the ability to collect this information during drilling, and analyze it thoroughly enough to be of immediate benefit. Drilling data can be gathered on a given bit run and analyzed in time to determine the optimum drilling conditions to be used on the succeeding bit run. The use of computers is the basis for this advancement. It has been concluded that drilling response is related to the shear and compressive strength of rocks, and these properties are used to indicate porosity in several logging techniques. Thus, rock properties used initially for predicting bit performance and drilling optimization are now used for formation evaluation. One of the resultant new logs is the drilling porosity log (DPL). It interprests drilling data that are related to formation properties, providing an early indication of formation type and porosity. (Campbell-NWWA)
W71-03850

4C. Effects on Water of Man's Non-Water Activities

RATES OF WATER INFILTRATION RESULTING FROM APPLICATIONS OF DAIRY MANURE,
Cornell Univ., Ithaca, N.Y. Dept. of Agronomy.
P. J. Zwerman, A. B. Drielsma, G. D. Jones, S. D. Klausner, and D. Ellis.
In: Relationship of Agriculture to Soil and Water Pollution; Proceedings, Cornell University Conference on Agricultural Waste Management, Rochester, January 19-21, 1970, Ithaca, 1970, p 263-270. 6 tab, 17 ref.

Descriptors: *Farm wastes, *Cattle, *Infiltration, Time, Corn, Alfalfa, Wheat, Rotations, Rainfall simulators, Rates of application, Fertilizers, Surface runoff, Rainfall.
Identifiers: *Dairy cattle, Intensity, Plots, Mass infiltration.

Sixty randomly selected plot locations were subject to infiltration tests with a rainfall simulator. Three successive tests of one half hour each were applied to the same plot. These results represent the effects of fourteen years of past management on seed beds prepared for corn. The rainfall rate was two and one half inches per hour. A two-by-two factorial and a two-by-four factorial experimental design were utilized. The two-by-two comparisons involved six tons of dairy manure plowed down versus no manure on continuous corn for grain at two rates of mineral fertilization. Manure increased infiltration by 27 percent, heavy mineral fertilization without manure on the last run resulted in a 60 percent decrease in infiltration as compared to manure with moderate mineral fertilization. The two-by-four factorial study again involved six tons of manure plowed down versus no manure on four rotations: (1) continuous corn for grain, (2) corn-oats-alfalfa-alfalfa, (3) corn-corn-oats-alfalfa-alfalfa, and (4) wheat-alfalfa-alfalfa-alfalfa-alfalfa. Manure did not significantly increase rates of infiltration. All rates of fertilization were very moderate. Only rotation No. 4 gave a significant 16 percent increase in rate of infiltration. DEVICE FOR FIELD DETERMINATION OF HEAVY METALS IN NATURAL WATERS,
Illinois Univ., Urbana. Water Resources Center.
Robert E. Van Atta.
Available from NTIS as PB-196 665, $3.00 in paper copy, $0.95 in microfiche. Final Report, Illinois Water Resources Center, Urbana, WRC Research Report No 35, December 1970. 28 p, 6 tab, 15 fig. OWRR Project A-032-Ill (1).

Descriptors: Trace elements, Water analysis, Water chemistry. Electrolytes, Streams, Electrodes, Polarographic analysis, Analytical techniques, *Pollutant identification, *Heavy metals, Instrumentation, Ions, Copper, Chromium.
Identifiers: Cadmium, Lead, Nickel, Zinc.

The objective was the development and testing of a simple, portable, self-contained device suitable for in situ analysis of natural waters for certain trace metals. The trace metals which were of primary interest were copper, lead, cadmium, nickel, chromium and zinc. Two models of the analyzer were built during the course of this experiment. The first model utilized a rotating platinum electrode in sulfosalicylic acid electrolyte. This was abandoned due to the inconsistent quality of high sensitivity results in the field and the interference of the sulfosalicylic acid medium with analysis of lead and iron ions. The second model used a dropping mercury electrode (DME) in the same electrolytic medium. The medium was discarded due to the interference with lead and iron, but the DME was retained with tri-sodium citrate as the medium since this allows analysis of lead, cadmium, zinc and iron. Details of the construction and field operation of the kit are explained in full. Field sampling techniques are also discussed. The operation of the device is relatively simple and the cost of construction of the inital model was less than $400. The design of the instrument allows the possibility of future development and adaptations. At present, however, the determination of metals is limited to only four ions. The use of mercury makes careful disposal of waste materials necessary. The results have not been compared with the results from known different tests with known reliability.

RELATIONSHIP BETWEEN POLLUTION INDICATOR ORGANISMS AND THE SALINITY OF MISSISSIPPI'S ESTUARINE WATERS,
Gulf Coast Research Lab., Ocean Springs, Miss.
D. W. Cook, and G. W. Childers.
In: Proceedings Water Resources Conference, Mississippi State University, State College, April 14-15, 1970, published by Mississippi State Univ. Water Resources Research Institute, p 181-191, 1970. 11 p, 6 fig, 6 ref. OWRR Project A-999-MISS (6).

Descriptors: *Estuaries, *Mississippi, *Coliforms, *Salinity, Water pollution sources, Bioindicators, Oysters, Wetlands, Commercial fishing, Sport fishing, Water pollution effects.
Identifiers: *Mississippi Sound.

In general, there is an inverse relationship between the median coliform MPN and the median salinity of the waters of the Mississippi Sound and nearby estuaries. There was, however, considerable variation in the individual coliform MPN counts obtained at all stations. The coliform MPN - salinity relationships in the major bay areas of the Sound were found to be different. These differences are attributed to the different natures and locations of the sources of the indicator organisms in the area and to the variations in the deep water channels in the area. A CONTROLLED DEPTH, VOLUMETRIC BOTTOM SAMPLER,
Herbert W. Jackson.
The Progressive Fish Culturist, Vol 33, No 2, p 113-115, April 1970. 4 fig, 14 plates, 3 ref.

Descriptors: *Sampling, *Benthos, *Estuarine environment, Limnology, Volume, Shallow water, Potamology, Safety, Mechanical equipment

Dredging, Bottom sediments, Marine animals, Aquatic environment, Ecology, Mudflats, *Pollutant identification, *Littoral.
dentifiers: Quantitative sampling, Infauna, Pollution ecology.

Basic plans are presented for a modification of the Petersen dredge principle for use by hand in wadeble waters, freshwater or marine. Extension hanles could be rigged for use from a boat for use in vaters up to ten or twelve feet in depth, similar to yster tongs. Both area and depth sampled can be ontrolled by design, making volumetric sampling easible if desired. Tips of jaws travel at constant epth. Ample vents covered with fine screening ermit escape of water without loss of organisms. losure of side gap when dredge is open eliminates ss of organisms via open ends during closure, also running water. Depth regulator prevents sinking soft bottoms, strong construction permits use in nds and gravels with up to three or four inch ones. Manipulation and power of hand closure educes dry hauls from sticks or pebbles jammed etween jaws. Handles promote safety from broken ass and other sharp objects in polluted areas. hey also permit use in deeper waters than can be onveniently sampled with Surber type hand samer, or sampling in inclement weather such as rough ice. Sample can be taken quickly, dumped to tub, and slurried or handsorted as desired. onstruction of high strength thin steel would duce weight; stainless steel would eliminate corsion.

FATTY ACID CONTENT AS A MEASURE OF THE ODOUR POTENTIAL OF STORED LIQUID POULTRY MANURE,
Guelph Univ. (Ontario). Dept. of Microbiology.
R. G. Bell.
Poultry Science, Vol 49, No 4, p 1126-1129, July 1970. 4 fig, 7 ref. Ontario Dept of Food and Agr No 695-04 Research Council of Canada No A5730.

Descriptors: *Poultry, *Legislation, *Odor, Farm wastes, Liquid wastes, Gas chromatography.
Identifiers: Fatty acid content, Odor potential.

An attempt was made to find a correlation between odour and the concentration of volatile fatty acids in stored liquid poultry manure. Using both gas chromatographic and column partition chromatographic analysis procedures a relationship between the odour and the fatty acid content of stored liquid poultry manure was observed. A total fatty acid content of 0.1% is suggested as a maximum level to be deemed acceptable for new installations and 0.2% as a minimum level for the initiation of prosecution which may be contemplated for existing facilities. (Christenbury-Iowa State)

URINARY CREATININE AS AN INDEX COMPOUND FOR ESTIMATING RATE OF EXCRETION OF STEROIDS IN THE DOMESTIC SOW,
Purdue Univ., Lafayette, Ind.
R. E. Erb, S. A. Tillson, G. D. Hodgen, and E. D. Plotka.
Journal Paper No 3644, Purdue University Agricultural Experiment Station. Journal of Animal Science, Vol 30, No 1, p 79-85, January 1970. 5 tab, 20 ref.

Descriptors: Farm wastes, Urine, Hogs, Livestock, Animal physiology.
Identifiers: *Steroids, *Creatinine, Index compound.

During two experiments urine was collected form 36 yearling sows to estimate rate-of-excretion of creatinine and to evaluate its use as an index compound. Excretion rate averaged 205 mg/hr. and 1.35 mg/hr./kg live weight for Experiment I as compared to 201 mg/hr. and 1.38 mg/hr./kg live weight for Experiment II. Measurement of urine volume for 48-hr. allows estimation of creatinine excretion rate of sows with coefficients of variability of 7-8%. In comparison, the coefficients of variability were 18 and 13%, respectively, for 12-hr. and 24-hr. periods. These experiments show that the ratio, microgram steroid per mg urinary creatinine is an accurate method for expressing rate of excretion of steroids in urine. (Christenbury-Iowa State)

INTRODUCTION,
Michigan State Univ., East Lansing. Dept. of Poultry Science.
H. C. Zindel, and C. J. Flegal.
In: Research Report 117, Farm Science, MSU Agricultural Experiment Station, July 1970, p 4-7.

Descriptors: *Farm wastes, *Poultry, Odor, Water pollution, Air pollution, Soil contamination, Technology, Nitrates, Nitrites, Disease, Insects, Treatment, Disposal, Standards, Land use.
Identifiers: *Environmental quality, *Confinement production, Animal management, Facility design.

The introductory remarks explain that agriculture-related pollution is but one part of a large national problem; so it must be considered together with municipal, industrial, marine and all other types of pollution in developing an integrated plan for improving the quality of our environment. The volume of livestock wastes produced is a function of the degree concentration and the size of individual production units. Animal wastes are of concern in water, air, and soil pollution. Examples of the increasing numbers of livestock and poultry being produced are given. New and improved technology is needed to handle the wastes from these animals. Problems discussed concerning pollution are: disease, odor, soil contamination, and insects. Four areas of emphasis are given that encompass the elements of a program for controlling animal wastes. W71-03556

DISTRIBUTION OF ARSENIC FROM POULTRY LITTER IN BROILER CHICKENS, SOIL, AND CROPS,
Salsbury Labs., Charles City, Iowa. Dept. of Biochemistry.
Joseph L. Morrison.
Journal of Agricultural and Food Chemistry, Vol 17, p 1288-1290, November 1969. 5 tab, 27 ref.

Descriptors: *Arsenic, *Farm wastes, *Poultry, Soil, Crops, Assay, Alfalfa, Clovers, Correlation analysis, Groundwater, Pesticides.
Identifiers: *Poultry litter, *Arsenical feed additives, Hydrolized feather meal, Poultry tissue, Roxarsone.

The effect of the presence of organoarsenicals from feed additives in poultry house litter was investigated with respect to the distribution of arsenic in chickens raised on this litter, to the distribution of arsenic in soil fertilized with this litter, and to the distribution of arsenic in crops raised on soil fertilized with this type litter. Although measurable amounts of arsenic (15-30 ppm) were found in the litter, the arsenic content of soil and crops was unaffected by the use of poultry litter as fertilizer. Similarly, the arsenic content of birds was unaffected when raised on this type litter. (White-Iowa State)

SURFACE RUNOFF AND NUTRIENT LOSSES OF FENNIMORE WATERSHEDS,
Wisconsin Univ., Madison. Dept. of Agricultural Engineering. State of Wisconsin.
S. A. Witzel, Neal E. Minshall, M. Starr Nichols, and John Wilke.
Transactions of the ASAE, Vol 12, No 3, 1969, p 338-341. 4 tab, 3 fig, 5 ref.

Descriptors: *Surface runoff, *Nutrients, Fertilizers, Farm wastes, Nitrogen, Phosphorus, Potassium, Wisconsin, Agricultural watersheds, Discharge, Soils, Topography, Geology, Cover crops, Weirs, Precipitation, Snow.
Identifiers: *Runoff sampler, Fennimore, Wisconsin.

The paper describes the soils, geology, topographic features and cover of a 330 acre watershed near Fennimore, Wisconsin. The watershed was subdivided and wiers were placed with semi-automatic runoff samplers to sample winter runoff water. The amount of commercial fertilizer as well as manure that was applied was determined. The runoff samples were analyzed and the amount of nutrients lost was calculated from the wier calibration. The amount of runoff during the winter of 1967 was about twice the 29 year average. The nutrients lost in surface runoff were much greater than those in the base flow of southwestern Wisconsin streams. In a year of average runoff, assuming nutrient losses directly proportional to runoff, the losses would be 2 lb. nitrogen, 0.6 lb. phosphorus and 4 lb. potassium per acre. (White-Iowa State)

NITRATE AND OTHER WATER POLLUTANTS UNDER FIELDS AND FEEDLOTS,
Agricultural Research Service, Fort Collins, Colo. Soil and Water Conservation Research Div.
B. A. Stewart, F. G. Viets, Jr., G. L. Hutchinson, and W. D. Kemper.
Environmental Science and Technology, Vol 1, No 9, p 736-739, September 1967. 2 fig, 1 tab, 1 ref.

Descriptors: *Nitrogen, *Nitrates, *Farm wastes, Groundwater, Water pollution, Water table, Soils,

Irrigation, Fertilizers, Precipitation, Corn, Hydraulic conductivity, Carbon, Oxidation-reduction potential, Alfalfa, Ammonium compounds, Colorado.
Identifiers: Feedlots, Soil cores, Groundwater pollution, South Platte.

Agriculture's effect on nitrate pollution of groundwater was investigated in the South Platte valley of Colorado. The valley is intensively farmed and contains many concentrated livestock feeding operations. A water table, generally between 3 and 20 meters below the surface, underlies much of the area. The average total nitrate-nitrogen to a depth of 6.7 meters in the profiles for the various kinds of land use was: alfalfa (13 cores), 70; native grassland (17 cores), 81; cultivated dry land (21 cores), 233; irrigated fields not in alfalfa (28 cores), 452; and feedlots (47 cores), 1282 kg. per hectare. Groundwater samples often contained high concentrations of nitrate, and those obtained beneath feedlots contained ammonium-nitrogen and organic carbon. (White-Iowa State)

SWINE WASTE MANAGEMENT - PROPERTIES OF SWINE WASTES,
Illinois Univ., Urbana. Dept. of Agricultural Engineering.
Arthur J. Muehling.
Cooperative Extension Service, University of Illinois at Urbana-Champaign, August 1969. 2 p. AEng-876.

Descriptors: *Farm wastes, *Physical properties, *Chemical properties, *Biological properties, Hogs, Antibiotics, Nitrogen, Potash, Biochemical oxygen demand, Chemical oxygen demand, Nutrients, Animal physiology, Biological treatment.
Identifiers: *Daily production, *Fertilizer value, Phosphoric acid, Population equivalent, Feed ration, Solids.

An understanding of the properties of swine wastes is necessary to develop an adequate system of waste management. The properties of swine wastes as classified by this fact sheet are physical, chemical, and biological. The physical and chemical properties may be affected by the physiology of the animal, the feed ration, and the environment. The quality of feed influences the amount the hogs will eat and the chemical composition of the wastes. The physical properties of daily production and amount of solids are listed by this fact sheet. The fertilizer value of swine manure is shown and the amounts required to obtain certain pounds per acre of nitrogen, potash, and phosphoric acid are told. Average values for BOD, COD and population equivalent are listed as biological properties of swine manure. (White-Iowa State)

PHOSPHORUS CONTENT IN UNCONSOLIDATED SEDIMENTS FROM SOUTHERN LAKE MICHIGAN,
Illinois State Geological Survey, Urbana.
John A. Schleicher, and John K. Kuhn.
Illinois Geological Survey Environmental Geology Notes No 39, November 1970. 15 p, 12 fig, 4 tab, 5 ref.

Descriptors: *Phosphorus, *Bottom sediments, *Lake Michigan, Pollutant identification, Path of pollutants, Water pollution sources, Sampling, Chemical analysis, X-ray fluorescence, X-ray spectroscopy.
Identifiers: Southern Lake Michigan.

177 samples from unconsolidated sediments on the bottom of Lake Michigan were analyzed by X-ray fluorescence spectrography for total phosphorus content; the samples, from varying depths, were taken from 56 locations. Statistical analyses of the results show that although the concentrations of phosphorus are uniformly rather low, correlations can be shown between the phosphorus content and, notably, the amounts of arsenic, iron, and organic carbon. WATER POLLUTION IN LAKE MICHIGAN BY TRACE ELEMENTS FROM POLLUTION AEROSOL FALLOUT,
Michigan Univ., Ann Arbor.
John W. Winchester, and Gordon D. Nifong.
Contribution 161, Dept of Meteorology and Oceanography, (1970). 29 p, 14 tab, 1 fig, 22 ref. USAEC Contract AT (11-1)-1705.

Descriptors: *Lake Michigan, *Water pollution sources, *Water pollution, *Air pollution, *Air pollution effects, *Water quality, Urbanization, Cities.
Identifiers: *Metropolitan areas, *Chicago metropolitan area, *Milwaukee metropolitan area, *Northwestern Indiana metropolitan area, Urban environment.

Certain trace elements which are strongly associated with air pollution sources in the Lake Michigan basin may be contributing significantly to lake water pollution by an atmospheric fallout route. A partial inventory of air pollution emissions for 30 trace elements is presented for the Chicago, Milwaukee, and northwest Indiana metropolitan areas, based on available published information, and compared with natural and pollution stream trace element inputs. Evidence indicates that the atmosphere may be the major source of Zn in Lake Michigan, and atmospheric inputs of Cu and Ni are also considerable. Moreover, the evidence suggests that air pollution probably exceeds expected unpolluted stream inputs for many additional elements in Lake Michigan, highlighting the need for more comprehensive chemical data to quantify the evaluation. (Davis-Chicago)

DESIGN OF AN OVERVIEW SYSTEM FOR EVALUATING THE PUBLIC-HEALTH HAZARDS OF CHEMICALS IN THE ENVIRONMENT VOLUME I TEST-CASE STUDIES,
Battelle Memorial Inst., Columbus, Ohio. Columbus Labs.
G. A. Lutz, S. B. Gross, J. B. Boatman, P. J. Moore, and R. L. Darby.
Available from NTIS as PB-194 398, $3.00 in paper copy, $0.95 in microfiche. Final Report, July 1967. 146 p. PHS Contract PH-86-66-165.
Identifiers: *Hazardous materials, Evaluation, *Pollution, Hazardous materials, *Public health, Human ecology, Toxic diseases, Mercury, Vanadium, Nickel, Fluorohydrocarbons, Paper industry, Pulp mills, Dosimetry, *Environmental health hazards.

The report is an initial effort in the development of a program that allows the Public Health Service to maintain an active overview of chemical contaminants that are now, or are likely to be, present in the environment. To illustrate the methods of applying the approach, as well as to develop the base for considering eventually all possible hazards, five specific contaminant classes are selected for individual treatment in separate sections following the general discussions. These sections summarize the contamination potentials of mercury, vanadium, nickel, fluorocarbons, and pulp and paper production, respectively. (See also W71-03771)
W71-03770

DESIGN OF AN OVERVIEW SYSTEM FOR EVALUATING THE PUBLIC-HEALTH HAZARDS OF CHEMICALS IN THE ENVIRONMENT. VOLUME II. THE OVERVIEW SYSTEM,
Battelle Memorial Inst., Columbus, Ohio. Columbus Labs.
G. A. Lutz, S. B. Gross, J. B. Boatman, P. J. Moore, and R. L. Darby.
Available from NTIS as PB-194 399, $3.00 in paper copy, $0.95 in microfiche. Final report, July 1967. 85 p. PHS Contract PH-86-66-165.
Identifiers: *Hazardous materials, Evaluation, *Pollution, *Information centers, *Public health, Human ecology, Toxic diseases, Data processing, Management systems, Warning systems, Forecasting, *Environmental health hazards, *Environmental health overview centers.

The United States Public Health Service, Office of Environmental Health, conceived a project to develop a mechanism for evaluating existing information and reducing it to manageable proportions and forms which would enable it to better carry out its responsibilities in research and control programs. The needed mechanism was considered to be a system which would provide an overview and identification of those activities which might lead to public-health hazards. A system design study verified this concept utilizing an overview information center to provide the necessary hazards-identification, evaluation, and alerting system. (See also W71-03770)

DIGITAL SYSTEMS FOR ON-SITE DATA COLLECTIONS FOR WATER QUALITY ANALYSIS,
Arkansas Univ., Fayetteville. Water Resources Research Center.
M. K. Testerman.
Available from NTIS as PB-197 116, $3.00 in paper copy, $0.95 in microfiche. Arkansas Water Resources Research Center, Publication No. 8, Fayetteville, 1970. 58 p, 2 tab, 26 fig, 3 ref, append.

Descriptors: *Data processing, Design criteria, Digital computers, Electronic equipment, *On-site data collection, *Monitoring, *Data transmission, *Data collections, Water quality, *Pollutant identification, Analytical techniques, Instrumentation.

A prototype system has been developed for recording and transmitting digital data at a remote water quality monitoring station in an unattended manner. As many as eight analog signals from transducers, which measure water quality characteristics such as dissolved oxygen, temperature, pH, chlorides, conductivity, redox, and turbidity, are converted to digital signals and recorded in binary coded decimal format on magnetic tape. This unit may be contacted from a central station for playback of the day's recording. The transmitted data can be recorded at the central station by teletype. Each data record includes a time-of-day 'word' so that all data is identifiable. The techniques developed during this contract period have possible application in many areas of water resource research, particularly for use in making water quality measurements in remote areas or at numerous sites report to one central station.

ı order to understand the effect of additional tem-
erature variations due to power station operation,
is necessary to study the natural seasonal tem-
erature ranges and the frequency and magnitude
the short term temperature variations of the in-
rtidal zone. An automatic data-recording system
ith thermistor probes for measuring the tempera-
re of intertidal zones is described. During a single
w tide period, variations in temperature of up to
) deg C and rates of change in temperature of 1
:g C/min have been recorded 1 cm below the sur-
ce. At a depth of 20 cm the changes in tempera-
re were slight. The temperature gradient in the
il may at times change rapidly. The intertidal
ne acts as a variable area radiator constantly ab-
rbing and re-radiating heat. In the Blackwater
tuary the heat exchanged at spring flood tides,
ıen the intertidal zone is cooled to a depth of 30
ı by an average of 1 deg C, was estimated to be
out 6.0 x 10 to the 12th power cals (24 Tera
ules). This value is equivalent to one-third of the
at discharged by Bradwell Nuclear Power Station
60 MW capacity) in 24 hours. The results of
me observations in Milford Haven are also given.

AGRICULTURE POSES WASTE PROBLEMS.

Environmental Science and Technology, Vol 4, No 12, p 1098-1100, December 1970. 2 fig.

Descriptors: *Farm wastes, *Pollutants, *Wastes identification, *Environmental effects, Water pollution sources.
Identifiers: *High intensity farming, Contamination, Plant emissions, Government action.

Increasing concentration and intensity of agricultural activities necessary to the development and prosperity of the economy, are responsible for many new environmental issues. Primary sources of pollution resulting from agricultural practices can be grouped as: animal wastes, wastes from processing of raw agricultural products, rural domestic wastes, and sediment from land; also plant nutrients from fertilizers, inorganic salts and minerals resulting from irrigation, pesticides, aeroallergens and infectious agents contribute to the problem; particulate and gaseous substances derived from the combustion of wastes and natural plant emmissions add to the problem. A brief description of these sources and some possible solutions are presented. (Christenbury-Iowa State)

RELATIONSHIP OF AGRICULTURE TO SOIL AND WATER POLLUTION.
Cornell Univ., Ithaca, N.Y.

Proceedings, Cornell University Conference on Agricultural Waste Management, January 19-21, 1970. Ithaca, 1970. 270 p.

Descriptors: *Soils, *Farm wastes, *Fertilizers, Groundwater, Precipitation, Potassium, Poultry, Cattle, Hogs, Nitrogen, Nitrate, Phosphorus, Phosphates, Rates of application, Nutrients, Effluent, Aquifer, Ammonia, Soil contamination, Water pollution, Water table, Oxidation lagoon, Irrigation, Aeration, Biochemical oxygen demand, Chemical oxygen demand, Odor, Biological treatment, Costs, Denitrification, Nitrification, Sludge, Storage, Nutrient requirements, Florida, Nebraska, Surface runoff, Infiltration.
Identifiers: *Feedlots, Oxidation ditch, Slotted floors, Aerator, Spreading, Land disposal.

The 1970 Conference attempted to bring knowledgeable individuals from many disciplines together to discuss various aspects of the problem. It was designed to serve as a mechanism for transmitting new research findings to those interested in this area and to demonstrate that agriculture is aware of its potential contributions to environmental pollution as well as its responsibility to society to find methods of alleviating such pollution while increasing the efficiency of production. The Conference played a useful role in providing communication across disciplines. Thirty-two papers are published in the proceedings dealing with all areas of agricultural pollution. GROUNDWATER QUALITY AND FLUCTUATIONS IN A SHALLOW UNCONFINED AQUIFER UNDER A LEVEL FEEDLOT,
Department of Agriculture, Lincoln, Nebr.
L. N. Mielke, J. R. Ellis, N. P. Swanson, J. C. Lorimor, and T. M. McCalla.
In: Relationship of Agriculture to Soil and Water Pollution; Proceedings, Cornell University Conference on Agricultural Waste Management, Rochester, January 19-21, 1970, Ithaca, 1970, p 31-40. 2 tab, 4 fig, 13 ref.

Descriptors: *Farm wastes, *Cattle, *Groundwater, *Nitrate, Aquifer, Discharge, Aquifer characteristics, Effluent stream, Groundwater recharge, Transmissivity, Water level fluctuations, Ammonia, Nebraska, Soil contamination, Observation wells, Water table, Infiltration.
Identifiers: *Feedlot, Platte River Valley.

The quality was investigated of the groundwater in the proximity of a level feedlot on a permeable soil with fluctuating high water table. At the feedlot site, the aquifer consists of 30-35 feet of high quality gravel having a coefficient of transmissibility in the range of 90,000-120,000 gallons per day per foot. Aquifer recharge occurs as a result of direct precipitation and interflow from the valley uplands. Six observation wells were installed in the vicinity of the feedlot as well as six water level measuring wells. Two recording wells, constructed of 4-inch diameter aluminum irrigation pipe, were jetted into the gravel aquifer. The water table depth at the feedlot varies with the season. Groundwater level changes reflect major rainstorms within hours after the event. The maximum groundwater elevation under the feedlot was approximately 2 feet below the soil surface. Soil cores were taken to determine the quantity of nitrate which could move into the water table. Low levels of nitrate were found below the first foot. Ammonia was present in only moderate amounts below 3 feet (A30ppm) and rapidly decreased in concentration with increased depth to the water table. Analysis of the core samples indicated that downward movement of nitrates and other forms of nitrogen in the soil was minor. The 12-15 inches of manure pack decreased the actual penetration depth of the nitrogen into the profile. Some samples exhibited levels of nitrate that exceeded Public Health standards (10ppm). This may have been due to the application of anhydrous ammonia prior to the first irrigation. Generally, the nitrate analysis showed relatively low nitrate level in the profile. THE NITROGEN CYCLE OF A DAIRY FARM,
Connecticut Agricultural Experiment Station, New Haven.
C. R. Frink.
In: Relationship of Agriculture to Soil and Water Pollution; Proceedings, Cornell University Conference on Agricultural Waste Management, Rochester, January 19-21, 1970, Ithaca, 1970, p 127-133. 4 fig, 1 tab, 11 ref.

Descriptors: *Nitrogen, *Nitrogen cycle, Farm wastes, Nutrients, Fertilization, Foliar application, Corn, Silage, Efficiencies, Nitrate, Groundwater, Ureas.
Identifiers: *Nitrogen conversion, Yield, Foliar fertilization.

Analyses of nutrient cycling on dairy farms in the Northeast have shown that significant quantities of nitrogen may be lost to groundwater. Calculations of the efficiency of nitrogen conversion on these farms revealed that losses to the environment increased dramatically as farm size decreased. Milk production was not affected by the increased nitrogen imported onto the farm while yields of corn silage increased only slightly. Thus, the total nitrogen imported onto the smaller farms could apparently be reduced without seriously reducing productivity. In addition, losses to the environment during cycling of the required amounts of nitrogen can be reduced by foliar applications to the growing crop, selection of varieties with high yield and nitrogen content, increased plant populations, and more extensive use of cover crops. HYDROLOGIC STUDIES FOR EVALUATION OF THE POLLUTION POTENTIAL OF FEEDLOTS IN EASTERN NEBRASKA,
Department of Agriculture, Lincoln, Nebr.
Norris P. Swanson, Lloyd N. Mielke, and Jeffery C. Lorimor.
In: Relationship of Agriculture to Soil and Water Pollution; Proceedings, Cornell University Conference on Agricultural Waste Management, Rochester, January 19-21, 1970, Ithaca, 1970, p 226-232. 15 ref.

Descriptors: *Farm wastes, *Cattle, *Runoff, Overland flow, Surface runoff, Infiltration, Water pollution, Erosion, Evaporation, Discharge, Settling basins, Precipitation, Slopes, Storage, Time, Nebraska.
Identifiers: *Feedlots, Mulch, Water stage recorder, Manure pack, Intensity.

Four questions are discussed which arise as a result of large numbers of cattle contained in feedlots in eastern Nebraska. There were two primary objectives of the research. First, the annual water balance of the feedlots was to be defined. The second objective was to characterize the water leaving the feedlots in overland flow or by percolation through the profile. The data collected provide only rough comparison, but should serve to put the probable runoff, erosion, and infiltration, or retention of water on a feedlot into perspective with the better known hydrologic characteristics of cropped land. In eastern Nebraska, this can be summarized as follows: (1) Infiltration on an established beef feedlot appears to be restricted to water storage in the manure pack, with very limited water movement through the profile; (2) the runoff from a feedlot, and hence the pollution potential, is a function of the area of the lot; (3) annual runoff from a beef feedlot may be two or three times that of adjacent cropland, and (4) despite increased runoff in comparison adjacent cropland, the protective mulch of the manure pack keeps erosion losses below those of the cropland. Descriptors: *Water quality, *Farm wastes, *Nutrients, Nitrogen, Phosphorus, Potassium, Fertilizers, Water pollution, Sediments, Pesticides, Regions, Basins, Time.
Identifiers: *Balance Sheet Method, Nutrient losses, Biologic inputs.

To the extent that the data are accurate, the paper presents a Balance Sheet Method that will show explicitly the quantity of nutrients contributed by agricultural activities to a stream. From this, one can determine the relative importance of agricultural pollution given knowledge of the total amount of nutrient pollution. Combining this information with that available on water quality and contributions from other sources, a waste management association will be able to more accurately determine the share that the agricultural industry will have to pay of the total cost of a program to maintain an abundant quantity of good quality water for all uses. Using this general method as well as modifying and improving the procedure will aid society's efforts toward effective water pollution control for all rivers and lakes in the United States. THE FARM ROLE IN WATER QUALITY MANAGEMENT,
Soil Conservation Service, Beltsville, Md.
Hollis R. Williams.
Water and Sewage Works, Vol 115, October 1968, p 463-464.

Descriptors: *Farm wastes, *Sediments, *Fertilizers, Insecticides, Herbicides, Water pollution, Watershed Protection and Flood Prevention Act, Channels, Cattle, Poultry, Pollution abatement.
Identifiers: Soil Conservation Service.

This article is based on information contained in an address by Williams to the Federal Water Quality Association. It is stated that three things find their way from farm lands into waterways to form major pollution problems. These are sediment, agricultural chemicals, and animal wastes. Sediment is the most significant of the three. Sediment also adsorbs phosphate and pesticides and carries them in streams. The major source of sediment is farmland, however, housing developments, new roads and other construction produces extremely large quantities of sediment. Four areas are mentioned which need continuing attention to control the erosion problem. The increased use of fertilizer is pointed out along its pollution capabilities. Research is currently being done to study the behavior of fertilizers, insecticides and herbicides on soils, water and plants. The problem of animal waste is also discussed. Four tools are pointed out as being necessary to achieve the goal of clean rivers and streams and successful control of pollution on farmlands as well as urban areas. (White-Iowa State)

SOURCES OF NITROGEN AND PHOSPHORUS IN WATER SUPPLIES - TASK GROUP REPORT.

Journal of the American Water Works Association, Vol 59, p 344-366, March 1967. 8 tab, 1 fig, 64 ref.

Descriptors: *Nitrogen, *Phosphorus, Farm wastes, Eutrophication, Great Lakes, Distribution, Fertilizers, Ammonia, Nitrates, Nitrites, Phosphorus, Compounds, Domestic wastes, Detergents, Industrial wastes, Nutrients, Fuels, Water treatment, Rivers, Runoff, Drainage water, Sediment transport, Cultivated lands, Water fowl, Atmosphere, Rainfall, Nitrogen fixation.
Identifiers: *Fertilizer consumption, Concentrations, Urban runoff, Dustfall, Historical trends.

The results of this survey have indicated that nitrogen and phosphorus nutrients are contributed to water in significant quantities from a variety of man-made and natural sources. Data taken from a small scale were extrapolated to large areas of the country. This brings attention both on the sources of most significance as well as on the sources for which additional information is most needed. The estimation of nutrient contributions from various sources is presented in tabular form. The complete elimination of nitrogen and phosphorus nutrients from surface water supplies does not appear economically feasible because the sources are so widespread. Therefore, appropriate efforts must be made to cope with many of the problems that have been created, and increased effort must be devoted to the development of better methods for prevention of algal growth in reservoirs. A more concentrated effort by the water utility profession to reduce the detrimental effects caused by eutrophication of water supplies is recommended. (White-Iowa State)

SOIL POLLUTANTS: THEIR ORIGIN AND BEHAVIOR,
Guelph Univ. (Ontario). Dept. of Microbiology.
D. E. Elrick, J. W. Biggar, and L. R. Webber.
Journal Soil Water Conservation, Vol 21, p 7-11, 1966. 3 fig, 26 ref.

Descriptors: *Pollutants, *Pesticide residues, *Degradation (Decomposition), Farm wastes, Pollutant identification, Effluents, Pesticides, Sewage, Domestic wastes, Disposal, 2-4-D, DDT, Chlorides, Radioactive wastes, Air pollution effects.
Identifiers: *Contaminants, Biological contaminants.

Pesticides, industrial and municipal wastes, radioactive materials, microbes, and other potential pollutants are coming in contact with our soil in ever increasing amounts. This article discusses certain sources of soil contaminants and outlines a few of the research techniques being used in an attempt to understand their behavior in soil. Agricultural chemicals may become harmful pollutants if improperly used. Sewage and industrial wastes make up the bulk of contaminating substances produced by our society. Waste disposal related to biological contamination of water supplies by bacteria and viruses. Radioactive contamination and some air pollutants come into contact with the soil. The movement of some of the soil pollutants is discussed. (Christenbury-Iowa State)

A GENERAL NUMERICAL SOLUTION OF THE TWO-DIMENSIONAL DIFFUSION-CONVECTION EQUATION BY THE FINITE ELEMENT METHOD,
California Univ., Davis.
G. L. Guymon, V. H. Scott, and L. R. Herrmann.
Water Resources Research, Vol 6, No 6, p 1611-1617, December 1970. 7 p, 3 fig, 11 ref. NSF Grant GZ-790.

Descriptors: *Diffusion, *Convection, *Linear programming, Mathematical studies, Equations, Computer programs, Numerical analysis, Dispersion, Porous media, Flow, Open channel flow.
Identifiers: *Finite element analysis.

The two-dimensional diffusion-convection equation, together with the appropriate auxiliary conditions, is used to describe approximately the motion of dissolved constituents in porous media flow, dispersion of pollutants in streams and estuaries, energy transfer in reservoirs, and other natural transport processes. The two-dimensional diffusion-convection equation, with an assumed set of auxiliary conditions, is converted to a variational principle for systems that do not involve mixed partials. The variational principle is in turn solved by the Ritz procedure by dividing the domain of interest into an arbitrary number of finite triangular elements. Within each element the unknown function states are represented by a first order space polynomial. The resulting system of first order linear equations is then solved by numerical differentiation using the Adams-Moulton multistep predictor-corrector method. (Knapp-USGS)

FFECT OF DDT ON TEMPERATURE SELEC-ON BY YOUNG ATLANTIC SALMON, LMO SALAR,
niversity of Western Ontario, London. Dept. of ology.
M. Ogilvie, and J. M. Anderson.
urnal of the Fisheries Research Board of Canada. l 22, p 503-512, 1965. 4 fig, 15 ref.

escriptors: *Pesticides, *DDT, *Temperature, tlantic salmon, Juvenile fishes, Chlorinated drocarbon, Pesticides, Acclimatization, Insecti-les, Water pollution effects.
entifiers: Sublethal doses, Salmo salar.

posure of Atlantic salmon, Salmo salar, un-ryearlings for 24 hr to sublethal doses of DDT, nging from 5 to 50 ppb, resulted in changes in the ected temperature. Low doses produced a wnwards shift in the selected temperature ereas higher doses produced an upwards shift. e DDT effect appeared to be more marked for rm-acclimated fish (17C) than for cold-accli-ted ones (8C). Exposure of warm-acclimated h to 10 ppb DDT or more appeared to make em extremely sensitive to cold water and there s some evidence to suggest that the lower lethal nit may have been raised. DDT may interfere th the normal thermal acclimation mechanism. Vahtola-Washington)

A PRELIMINARY REPORT ON RAPID BIOLOGICAL INFORMATION SYSTEMS FOR WATER POLLUTION CONTROL,
Virginia Polytechnic Inst., Blacksburg, Va.
John Cairns, Jr., Kenneth L. Dickson, Richard E. Sparks, and William T. Waller.
Journal Water Pollution Control Federation, Vol 42, p 685-703, 1970. 1 tab, 22 fig, 22 ref.

Descriptors: *Water pollution control, Systems analysis, Toxicity, *Monitoring, Data collections, Bioindicators, Surveys, Ecosystems, Water quality, Fish, Fish physiology, Fish behavior.

The time required to generate biological information may be reduced according to preliminary results of tests of one in-stream and two in-plant biological monitoring systems studied. A Sequential Comparison Index (SCI) was developed as a rapid method for non-biologists to assess the biological consequences of pollution and express the results numerically. Fish movement patterns and heart and breathing patterns were studied in-plant. Changes in these parameters may indicate toxicant concentrations not detectable by traditional bioassays. (Wahtola-Washington)
W71-03367

INFLUENCE OF BODY WEIGHT ON CHRONIC ORAL DDT TOXICITY IN COHO SALMON,
Bureau of Sport Fisheries and Wildlife, Columbia, Mo. Fish-Pesticide Research Lab.
Donald R. Buhler, and W. E. Shanks.
Journal of the Fisheries Research Board of Canada, Vol 27, p 347-358, 1970. 7 fig, 3 tab, 22 ref.

Descriptors: *DDT, *Pesticides, Weight, *Fish diets, Mortality, Laboratory tests, Bioassay, *Lethal limit, Pesticide removal, Toxicity, Salmon, Water pollution effects, Insecticides.
Identifiers: Coho salmon, *LD50, Body size, *Median survival time, *Pesticide uptake.

Median Survival time was directly proportional to body weight in young coho salmon of the same age that were fed a diet containing technical DDT. Supplementation by additional feeding with DDT-free diet prolonged the lifespan of these fish but the median survival time remained a direct function of body weight. The primary effect of body size on lethality was to control the rate of DDT intake by the fish. The smallest fish consumed the greatest amounts of diet and, consequently, these fish received the highest milligram per kilogram doses of DDT. In addition, however, the smaller salmon succumbed to a lower milligram per kilogram cumulative lethal dose than did the larger fish, perhaps because the smallest fish contained a lower percentage of lipid and thus failed to provide for adequate storage detoxification of the DDT. (Sjolseth-Washington)
W71-03368

TOXICITIES OF SOME HERBICIDES TO SIX SPECIES OF FRESHWATER CRUSTACEANS,
Bureau of Sport Fisheries and Wildlife, Columbia, Mo. Fish-Pesticide Research Lab.
Herman O. Sanders.
Journal Water Pollution Control Federation, Vol 42, p 1544-1550, 1970. 3 tab, 16 ref.

Descriptors: *Pesticides, *Bioassay, *Toxicity, *Crustaceans, Herbicides, Shellfish, Aquatic animals, Water pollution effects, Shrimp, Daphnia, Crayfish, Mortality, Invertebrates.
Identifiers: TL50, Scud, Sowbug, Dichlone.

The relative toxicities of some 37 herbicides to six species of freshwater crustaceans were described. Static bioassays were conducted on scud, glass shrimp, sowbug, crayfish, daphnia, and seed shrimp. Toxic effects were measured by determining the Median Tolerance Limit (TL50) for 24-, 48-, and 96-hr exposures. The 37 herbicides not only differed greatly in toxicity but also exhibit large variations in sensitivity among the six species. The toxicities of different formulations of the same herbicide also differ greatly. Dichlone was the most toxic herbicide tested. Herbicides were generally most toxic to daphnia; following in descending order of sensitivity were seed shrimp, glass shrimp, sowbug, scud, and crayfish. (Wahtola-Washington)

DISTRIBUTION OF INGESTED ZINC-65 IN THE TISSUES OF SOME MARINE CRUSTACEANS,
Oregon State Univ., Corvallis. Dept. of Oceanography.
Scott W. Fowler, Lawrence F. Small, and John M. Dean.
Journal of the Fisheries Research Board of Canada, Vol 27, p 1051-1058, 1970. 3 tab, 2 fig 20 ref. Atomic Energy Commission AT (45-1) 1830, PHS Grant ES00026.

Descriptors: *Heavy metals, Metabolism, Crustaceans, Shrimp, Water pollution effects, *Metals, Marine animals, Rates, Shellfish, *Zinc radioisotopes, Radiochemical analysis, Invertebrates.
Identifiers: Euphausia pacifica, Zn-65, Thysonoessa spinifera.

Autoradiographs of tissues of euphausids and shrimps fed 65Zn through a food chain showed the isotope located primarily in the muscle fibers, in the eye, within the exoskeleton, and on the interior surface of the exoskeleton. Comparisons of the autoradiographic evidence with concentrations of radiozinc and stable sinc in the various dissected tissues were in good agreement. The specific areas of Zinc is highly labile in marine crustaceans and will accumulate in certain specific locations regardless of the mode of uptake. The rates at which various tissues became saturated with 65Zn were dependent upon mode of uptake, however. Because most of the 65Zn was located intracellularly, and not intrcellularly, most ingested zinc apparently accumulates in excess of the animals' needs and is not used metabolically. (Wahtola-Washington)

MINERALIZATION PROCESS OF ORGANIC MATTER IN LAKE WATER,
Nagoya Univ. (Japan). Water Research Lab.
Tadashiro Koyama, and Takao Tomino.
Kyoto University Misaki Marine Biological Institute Bulletin, No 12, p 111-124, February 1968. 14 p, 6 fig, 4 tab, 22 ref.

Descriptors: *Biodegradation, *Organic matter, *Lakes, *Eutrophication, *Water chemistry, Nitrification, Solubility, Solutes, Plankton, Decomposing organic matter.
Identifiers: *Japan.

Studies on the mineralization process of organic matter were carried out in Lake Kizaki-ko (maximum depth: 28.5m), a mesotrophic lake in Navano Prefecture, Japan. The ratio of organic carbon to organic nitrogen was 5.7 in plankton, 9.3 in detritus collected at 25 meters in water, and 15.5 in bottom sediments. During the early stage of the stagnation period, the process of nitrogen fixation is generally a little more active than denitrification, but during most of the stagnation period, denitrification remarkably exceeds nitrogen fixation. At the end of the stagnation period, the amount of denitrified N is considerably larger than other mineralized nitrogenous compounds. Denitrification constitutes the dominant process determining the nitrogen metabolism in the lake water. The average ratio of total mineralized carbon and nitrogen in the lake at the end of the stagnation period was 3.53, a value considerably smaller than the corresponding value for plankton, 5.7. This fact supports the view that the greater ease of decomposition of nitrogenous fraction of dead planktonic material as compared with that of the carbonaceous fraction causes the increase in the ratio of Org.C/Org.N towards the bottom. (Knapp-USGS)

REPORT OF NATIONALLY DESIGNATED EXPERTS ON EUTROPHICATION CONTROL.
Organization for Economic Co-Operation and Development, Paris (France).

Organization for Economic Co-Operation and Development, Ex 40103, 1970. 34 p, 5 append.

Descriptors: *Conferences, *Eutrophication, *Control, *Foreign research, Water quality, Water pollution effects, Water pollution sources, Integrated control measures, Legal aspects, Fertilizers, Detergents, Water resources, Investment, Costs.
Identifiers: *OECD, *Water Management Research Group, Development projects, Canada, Finland, France, Germany, Italy, Netherlands, Norway, Spain, Sweden, Switzerland, United Kingdom, United States.

This report, submitted in 1969 by delegates of different countries, contains a review of problems and control measures of water eutrophication. The document raises several legal issues relative to the agricultural use of fertilizers and the sale of phosphorus-free detergents. Five appendices include a list of representatives of different nations, a list of submitted national reports, and proposals for measurements of essential factors of eutrophication. (Wilde-Wisconsin)

SCIENTIFIC FUNDAMENTALS OF THE EUTROPHICATION OF LAKES AND FLOWING WATERS, WITH PARTICULAR REFERENCE TO NITROGEN AND PHOSPHORUS AS FACTORS IN EUTROPHICATION,
Organization for Economic Co-Operation and Development, Paris (France).
Richard A. Vollenwider.
Organization for Economic Co-Operation and Development, Ex 40105, 1970. 193 p, 34 fig, 41 tab.

Descriptors: *Eutrophication, *Phosphorus, *Nitrogen, Lakes, Rivers, Impoundments, Aquatic life, Plankton, Biomass, Productivity, Trophic level, Nutrients, Water pollution control, Water pollution effects, Water pollution sources, Waste water treatment, Inorganic compounds.
Identifiers: *OECD, *Committee for Research Cooperation, Aquatic blooms, Hydrophytes, Nutrient sources, Nutrient concentration.

These 160 pages of text, supplemented by many diagrams (and a bibliography (See W71-03448) issued separately) are described as a report. In actuality this volume is a textbook-like monograph covering a good many aspects of inorganic water eutrophication, particularly that caused by nitrogen and phosphorus. The subjects which were given primary attention in the 7 chapters of the volume include physiology and ecology of bloom-forming organisms; relation between the biomass of plankton and trophic level of waters; sources, supply, and critical concentration of nutrients; elimination of phosphorus and nitrogen from wastewaters. A considerable fraction of the assembled information could be well incorporated into a textbook on the subject. (Wilde-Wisconsin)

CHANGES IN THE BLOOD OF BROOK TROUT (SALVELINUS FONTINALIS) AFTER SHORT-TERM AND LONG-TERM EXPOSURE TO COPPER,
National Water Quality Lab., Duluth, Minn.
J. M. McKim, G. M. Christensen, and E. P. Hunt.
Journal of the Fisheries Research Board of Canada, Vol 27, No 10, p 1883-1889, 1970. 1 tab, 1 fig, 27 ref. FWQA Project 18050 ETN 12/70.

Descriptors: *Brook trout, *Trout, *Toxicity, *Copper, Water pollution effects, Pollutant identification, Analytical techniques.
Identifiers: *Blood change, Plasma.

Seven blood characteristics--red blood cell count (RBC), hematocrit (Hc), hemoglobin (Hb), plasma chloride (Cl), plasma glutamic oxalacetic transaminase (PGOT), L-aspartate: 2-oxoglutarate amino transferase), osmolarity (Os), and total protein (TP)--were measured in brook trout (Salvelinus fontinalis) that had been exposed to three concentrations (67.5-69.2, 38.2-39.0, and 22.8-24.0 ug/liter) of Cu (II) for 6 and 21 days. Concentrations of 67.5-69.2 and 38.2-39.0 ug/liter caused statistically significant increases in RBC, Hc (6-day only), Hb, PGOT, and TP (6-day only), whereas Cl and Os decreased during both exposure periods. Five blood characteristics (RBC, Hb, Hc, Cl, and PGOT) were also measured in brook trout, which were exposed for 337 days to Cu (II) concentrations of 32.5, 17.4, 9.5, 5.7, and 3.4 ug/liter. After this long-term exposure, no changes were observed in the blood except for a measurable decrease in PGOT values at 32.5 and 17.4 ug/liter. The disappearance of initial blood changes, after extended exposure, suggests the transient nature of these early responses. Application of this study to the evaluation of the physical condition of fish and the possible long-range forecasting of reproductive success and survival of a species is discussed.
W71-03450

MOLLUSCS FROM A POWER STATION CULVERT,
Central Electricity Generating Board, Leatherhead (England). Central Electricity Research Labs.
D. S. Davis, and W. R. White.
Journal of Conchology, Vol 26, No 1, p 33-38, 1966. 2 fig, 1 tab, 6 ref.

Descriptors: Power plants, *Fouling, *Molluscs, *Mussels, Water pollution effects.
Identifiers: Intake culvert.

The objective was to gain information on the fouling which may be of use in devising control measures. The samples were taken to study the settlement of the edible mussel which grows in large numbers in the culvert. If left unchecked these growths of mussels may cause reductions in the water flow and blocking of condenser tubes which can decrease the efficiency of the power station and consequently increase the cost of electricity generation. The samples collected were initially preserved in 5 percent formation in sea water but later transferred to sea water. The collections made from the culvert have provided some 34 species. The species recorded are listed, with appropriate notes, according to the system and nomenclature employed by Winckworth. The occurence of various mollusc species in the samples are given in a table. The many dead shells and the distorted shells of living specimens indicate the large-scale settlement of larvae on to a substrate which is totally unsuitable for the adults. This feature is particularly well shown by those pelecypods which normally have a burrowing habit, e.g. Venerupis and Petricola pholadiforms. (Upadhyaya-Vanderbilt)
W71-03468

SOME EFFECTS OF HEATED EFFLUENTS ON MARINE PHYTOPLANKTON,
Central Electricity Generating Board, London, (England).
P. D. V. Savage.
Symposium on marine biology, p 27-32, October 2, 1969. 3 fig, 1 tab, 4 ref. Laboratory memorandum RD/L/M 269.

Descriptors: *Thermal pollution, *Phytoplankton, *Food chains, Power plants, Estuaries, Cooling water, Carbon radioisotopes, Plant physiology, Photosynthesis, Water pollution effects.
Identifiers: *Marine environment.

Phytoplankton species, as primary producers, play a fundamental role in marine food chains. In situ measurements of the effects on phytoplankton of passage through power station condensers is made. In situ measurements of the carbon assimilation rates of natural phytoplankton populations at the different temperatures was made using the 14C technique as recommended by Steemann Nielesen. Over the course of the year there appeared to be no significant difference between the carbon-assimilating capacities of heated and unheated samples. Regular microscopical examination of samples show no apparent increase in the number of dead cells in outfall samples. Effect of the duration of exposure to elevated temperatures on subsequent growth of Isochrysis galbana in culture is shown in two figures. Existing knowledge of algal physiology indicates that over limited temperature ranges above the optimum, the inactivation of biochemical components of cells is reversible. Such effects might well occur in marine phytoplankton. (Upadhyaya-Vanderbilt)
W71-03469

THERMAL POLLUTION THREAT DRAWS NEARER,
E. E. Dallaire.
Civil Engineering, p 67-71, October 1970. 3 fig.

Descriptors: *Thermal pollution, *Nuclear power plants, *Temperature, Ecology, Cooling towers, Fish.
Identifiers: Temperature standards, Waste heat.

The thermal pollution threat will be met by, disposing of excess heat through cooling towers, cooling ponds, or spray ponds, by upgrading power generating efficiency, by managing the receiving waters to reduce the harmful impact of heat on water bodies and by making use of waste heat. Increase in temperature of the water body causes increase in metabolism, decrease in reproductive ability of fish and other organisms. They become more susceptible to disease and poisoning and their ability to catch food decreases. Recent biological studies at several power plant sites around the U. S. found that thermal discharges had no significant short-term impact on aquatic life. The use of evaporative cooling tower rather than once-through systems increases the cost of generating power by about 5%. Some of the more frequently heard proposals for putting this heat to good use include space heating, industrial processes, agriculture, aquaculture, water and waste treatment, desalinization, de-icing harbors, and recreation. Temperature recommendations proposed by the National Technical Advisory Committee on water quality standards are discussed. (Upadhyaya-Vanderbilt)

BENEFICIAL USES OF THERMAL WATER,
Vitro Corp. of America, Portland, Oreg. Portland Operation.
Herman H. Miller, Jr.
Thermal Water Horticultural Demonstration Project at Springfield, Oregon, Chemurgic Council 32nd Annual Conference, Washington, D.C., October 22-23, 1970. Typescript. 6 p.

Descriptors: *Thermal water, *Sprinkler irrigation, *Irrigation, Water reuse, Horticulture, Demonstration farms, Drainage, Cooling water, Thermal pollution, Cooling towers.
Identifiers: Springfield, Oregon.

The utilization of thermal waters from industry in a multi-use concept that would benefit the public, industry and agriculture is treated in this paper. A field-demonstration project for agriculture is presented. Programs such as: Frost protection, plant cooling, irrigation, soil heating and drainage

studies are analyzed. A critical factor in frost protection by sprinkler application is the proper management of water application to preclude limb breakage, as a result of ice formation, which can cause breakage loss to trees that exceeds the loss caused by frost. Warm water from sprinklers can be used to cool plants during warm, dry summer months. The project demonstrates how this procedure reduces sunscald, eliminates cold water shock, increases yields and improves the quality of crops. Broad irrigation effects of thermal water are being monitored on the project. (Herrera-Vanderbilt)
W71-03471

HEAT TRANSIENTS AND ECOLOGY,
Central Electricity Generatirng Board, London, England).
J. Holmes.
Symposium on marine biology, p 50-51, October 2, 1969. 1 ref. Laboratory memorandum RD/L/M 69.

Descriptors: *Thermal pollution, *Ecology, Power plants, Coasts, Temperature.
Identifiers: Heat transients.

The stream of warmed water from a coastal power station may produce marked local heating effects or in excess of the average level of heating in the outfall area. As the sea surface rises and falls with the tide, this warmed layer comes into contact with varying areas of the sub-littoral zone. The behavior of shore animals under steady temperature conditions gives little guide to their probable reactions to these rapidly changing temperature. The presence of under and overshoot effects may be particularly significant. At lower, sublethal, values constantly varying temperatures affect feeding efficiency, food conversion, growth rate and gonad maturation. (Upadhyaya-Vanderbilt)
W71-03472

PHYSICAL AND ECOLOGICAL EFFECTS OF WASTE HEAT ON LAKE MICHIGAN.
Fish and Wildlife Service, United States Department of the Interior, September 1970. 101 p, 7 fig, 24 tab, 60 ref.

Descriptors: *Thermal pollution, *Lake Michigan, *Heated water, *Aquatic environment, *Water temperature, Fish kill, Aquatic habitats, Ecological effects, Wild life, Eutrophication.
Identifiers: *Waste heat, *Inshore waters, Thermal loadings, Thermal tolerances, Fishery resource.

The purpose of the present report is to analyze the ecological damages to Lake Michigan as a result of the discharge of industrial and municipal waste heat. Since not enough data are available about these effects, interview standards must be set for Lake Michigan on the basis of existing knowledge. This paper presents the available evidence that substantiates this concern. Heat addition is an essentially accumulative problem that would contribute to inshore eutrophication and be intolerable for the fish and wildlife standpoint by the year 2000. Analysis of inshore waters, thermal loadings, effects of temperature fluctuation on Lake Michigan fish and ecological ramifications of the addition of waste heat are presented and discussed. Among the conclusions based on the evidence presented in the report, it is stated that no significant amounts of waste heat should be discharged into Lake Michigan. (Herrera-Vanderbilt)
W71-03474

WATER QUALITY AND POWER PLANTS,
Duke Power Co., Charlotte, N.C.
Austin C. Thies.
Edison Electric Institute Bulletin, p 201-206, June-July 1969. 9 fig.

Descriptors: *Thermal pollution, *Water cooling, *Heated waters, *Power plants, Industrial water, Fishkill, Wildlife, Dissolved oxygen, Aquatic habitats.

Analysis and discussion on what industry has done to minimize the effect of heated discharges from power stations to the receiving waters is presented in this paper. It is stated that industries are carrying out many studies on the biological effects of heated water discharges on Biota at actual power plant sites. There is a good evidence that adding large amounts of heat to water in itself is not likely to have harmful effects on the life in and around the water at low temperatures. However, when additions are on a long series of hot days at low river-flows in areas where sewage wastes are dumped, the balance of life in and around the water will be upset in a variety of ways, some of which are harmful. Industry must avoid these kind of changes. (Herrera-Vanderbilt)
W71-03475

MARINE BIOLOGY AND ELECTRICITY PLANNING,
Central Electricity Generating Board, London (England).
D. Clark.
Symposium on Marine Biology, October 2, 1969, p 4-7. Laboratory Memorandum RD/L/M 269.

Descriptors: *Power plants, *Thermal pollution, Planning, Marine plants, Cooling towers, Estuaries.
Identifiers: Siting power stations.

It is at the planning stage that the environmental impact of a new project is largely determined. A dry tower is about three times as bulky as the equivalent wet tower and is much more costly. The demands of a large modern station far exceed the dry-weather flows of even our largest rivers. With limitations on inland water resources more power stations have been established on estuaries and the coast, mostly using direct cooling. It is concluded that planning engineers and biologists must keep each other informed when a new plant is planned. (Upadhyaya-Vanderbilt)

FUTURE USE OF THE CHESAPEAKE BAY FOR COOLING THERMAL DISCHARGES,
Johns Hopkins Univ., Baltimore, Md. Dept. of Geography.
Derek K. Brady, Arthur S. Brooks, Norman L. Buske, Graves L. Willard, Jr., and John F. Hoffman.
Water Sciences and Management Program, Seminar Report, July 1969, 262 p. 35 fig, 19 tab, 182 ref.

Descriptors: *Thermal pollution, *Thermal capacity, *Cooling waters, Aquatic environment, Recreational activities, Solar radiation, Temperature, Stagnant water, Aquatic plants, Aquatic animals.
Identifiers: *Chesapeake Bay, *Biological effects, *Heat disposal.

The surface cooling and advective heat capacity of the Cheasapeake Bay is estimated to be of sufficiently great magnitude to warrant the utilization of the estuary's cooling capacity. However, uniform distribution of the surplus heat over the entire surface of each subregion will be required in order to have the maximum utilization of the estuary's theoretical total heat assimilative capacity. It is stated that cooling waters from large and concentrated heat sources should be spread over as large an area as possible, without causing local disturbances to the ecology near the point of discharge. Analysis of various aspects: the Chesapeake Bay, cooling requirements of thermal power plants, heat assimilative capacity, physical aspects of thermal discharges, biological and ecological considerations are given in the present paper. POLLUTION FACTORS ASSOCIATED WITH EXCESSIVE POULTRY LITTER (MANURE) APPLICATION IN ARKANSAS,
Arkansas Univ., Fayetteville. Dept. of Agronomy.
Leslie H. Hileman.
In: Relationship of Agriculture to Soil and Water Pollution; Proceedings, Cornell University Conference on Agricultural Waste Management, Rochester, January 19-21, 1970, Ithaca, 1970, p 41-47. 9 tab, 1 fig, 5 ref.

Descriptors: *Farm wastes, *Poultry, Water pollution, Soil contamination, Rates of application, Soil tests, Phosphorus, Potassium magnesium, Salts, Ions, Nitrates.
Identifiers: *Poultry litter, Mono-valent ions, Di-valent ions.

There is an estimated one million tons of poultry manure or manure plus litter produced from 390.. million chickens and turkeys grown in Arkansas annually. The waste manure-litter is being returned to the soil often at rates exceeding 10 tons per acre annually. The data presented indicates that soil pollution and related problems may occur. These problems can be considered as: (1) excess soluble salt, (2) chemical imbalance with particular reference to K and the mono-valent to di-valent ratio, (3) excessive nitrate production and accumulation to toxic levels in forage and farm water supplies, and (4) forages deficient in magnesium for adequate animal nutrition. Further studies are needed to understand the mechanisms by which these conditions are carried out in the soil medium so that effective measures can be taken to prevent soil and water pollution. THE MENACE OF NOXIOUS GASES IN ANIMAL UNITS,
Ohio State Univ., Columbus. Dept. of Agricultural Engineering.
E. Paul Taigonides, and Richard K. White.
Transactions of the ASAE, Vol 12, No 3, 1969, p 359-362, 367. 2 tab, 18 ref.

Descriptors: *Farm wastes, *Gases, *Effects, Carbon dioxide, Oxygen, Ammonia, Hydrogen sulfide, Methane, Lethal limit, Toxicity, Cattle, Hogs, Poultry, Ventilation, Treatment.
Identifiers: *Concentrations, Storage pits, Pit cleaning, Lethal situations.

The paper begins with a description of noxious gases and it is noted that animal deaths have occurred as the result of an accumulation of these gases. The gases, their properties and characteristics listed, are carbon dioxide, ammonia, hydrogen sulfide, methane, and other gases. Oxygen is listed to show its indispensability inside a confinement building. Animal response to menacing concentrations of these gases is described. A table lists different properties of the noxious gases and their physiological effects on the animals. Possibly fatal concentrations are noted, along with

the potentially lethal situations which may bring about these concentrations. Among these situations are ventilation breakdowns, pit stirring and pit cleaning. Finally, the control of noxious gases is emphasized. Preventive measures, moderating the effects of noxious gases, and treatment of affected animals are all discussed. (White-Iowa State)

MICROBIOLOGY OF SEWAGE LAGOONS-ROLE OF PURPLE SULFUR BACTERIA IN STABILIZATION OF INDUSTRIAL WASTES,
North Dakota Water Resources Research Inst., Fargo.
John W. Vennes.
Available from NTIS as PB-196 656, $3.00 in paper copy, $0.95 in microfiche. Research Project Technical Completion Report WI-221-010-70, July 1965-Dec 1967, April, 1970. 16 p, 8 tab, 29 ref. OWRR Project A-003-NDAK (1).

Descriptors: Microbiology, *Sewage lagoon, Coliforms, Enteric bacteria, Biochemical oxygen demand, Temperature, Hydrogen ion concentration, Sulfides, *Sulfur bacteria, Sulfates, *Bacteria, Industrial wastes, *Oxidation ponds, Stabilization, Microorganisms.
Identifiers: Purple sulfur bacteria, Algal populations.

Ecologic relationships among various lagoon organisms and chemical and physical parameters of the lagoon were attempted. Pure cultures of the purple sulfur bacteria, Chromatium vinosum and Thiocapsa floridana were characterized with respect to optimum pH, temperature, and a variety of organic substrates. Purple sulfur bacteria reached maximal populations in the lagoon during the summer months when levels of acetic, butyric, and propionic acids were being depleted. Sulfide apparently was being liberated from sulfate by sulfate reducing bacteria. Methane bacteria reached their peak after sulfide disappeared from the lagoon and while formate utilization was reaching its maximal amount. Coliform, fecal coliform, and enterococci did not increase in the lagoon during the summer months. Algal populations remained minimal during the purple sulfur stage and increased approximately one log thereafter. Experimental and actual lagoon substrate determinations suggest that the purple sulfur bacteria are predominantly responsible for the utilization of volatile fatty acids from the lagoon. Furthermore, the majority of the BOD in the lagoon may be attributed to these volatile acids. A variety of microbial and chemical determinations were made. (See also W70-03312)

COAGULATION TESTING: A COMPARISON OF TECHNIQUES,
Wisconsin Univ., Madison. Water Resources Center
Rudy J. Te Kippe, and Robert K. Ham.
Available from NTIS as PB-196 666, $3.00 in paper copy, $0.95 in microfiche. Water Resources Center, University of Wisconsin, Madison, Wisconsin 53706, 1970. 58 p, 17 fig, 1 tab, 38 ref. OWRR Project A-028-WIS (2).

Descriptors: *Coagulation, *Turbidity, *Colloids, *Waste water treatment, Laboratory tests, Alum, Filtration, Hydrogen ion concentration.
Identifiers: Residual turbidity, Filtered turbidity, *Refiltration, Colloid titration, Sensitivity.

The literature indicates that over twenty different tests have been used for the purpose of evaluating the coagulation of turbidity in water treatment. Five of these tests were selected for study as they were felt to be basic and/or particularly important. These include: residual turbidity, filtered turbidity, refiltration, colloid titration, and a continuous pilot scale filter process. The five methods were compared holding all variables other than pH and alum dose constant. While some tests were shown to strongly correlate with others, the results of the refiltration technique were found to be biased in favor of low alum concentrations, and the colloid titration test was found to lack sensitivity with respect to variations in alum dosage but was quite sensitive to pH changes. The practical implications of this study suggest that water treatment plants should follow guidelines given for choosing the most useful test for their process. (See also W71-03313)

EFFECT OF SODIUM CHLORIDE AND SODIUM SULFATE ON SLUDGE DIGESTION,
Georgia Inst. of Tech., Atlanta. Engineering Experiment Station.
Robert S. Ingols, Richard E. Robert, Jr., Ekkehard Gasper, and Popet Vira.
Available from NTIS as PB-196 732, $3.00 in paper copy, $0.95 in microfiche. Final Report to Federal Quality Administration, Project B-338, September 1970. 40 p, 5 tab, 13 fig, 7 ref. FWQA Program 17070 DYF -- 09/70.

Descriptors: Waste water treatment, *Sludge treatment, *Sludge digestion, *Biodegradable detergents, *Sodium sulfate, *Sodium chloride, Ion exchange, Textiles, Microorganisms, Ions, Aerobic treatment, Foaming, Flocculation.
Identifiers: Industrial waste treatment, Sulfide ion effects, *Textile mill wastes.

High concentrations of sodium chloride and sodium sulfate have been observed in a town with a high concentration of textile mills. Sludge digestion was very poor. A toxic synergism between sodium chloride and sodium sulfate (sulfide) was hypothecated. Data indicated a marked reduction in gas production through a bi-sulfide ion effect upon the first stage microorganisms. The methane organisms appeared to starve rather than suffer a toxic effect from an accumulation of first stage by-products. Inert salt concentration had very little effect. Biodegradable synthetic detergents now used in place of salt to cause dye uptake require long periods of aerobic treatment because of interference by foam in floc development.

DEVELOPMENT OF A PORTABLE PILOT PLANT TO DEMONSTRATE REMOVAL OF CARBONACEOUS, NITROGENOUS, AND PHOSPHORUS MATERIALS FROM ANAEROBIC DIGESTER SUPERNATANT AND SIMILAR PROCESS STREAMS,
FMC Corp., Santa Clara, Calif. Central Engineering Labs.
George E. Bennett.
For sale by the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402. I67, 13/4; 17010 FKA-05/70 paper copy $1.00. Also available from NTIS as PB-196 733, $0.95 in microfiche. Water Pollution Control Research Series ORD-17010 FKA 05/70, May 1970. 73 p, 16 tab, 15 fig, 4 ref, append. FWQA Program 17010 FKA -- 05/70, Contract No. 14-12-414.

Descriptors: *Waste water treatment, Sludge treatment, Nutrients, Nitrogen compounds, Phosphorus compounds, *Anaerobic digestion, Digestion.
Identifiers: *Phosphorus Removal, *Nitrogen Removal, *Nutrient removal, Ammonia stripping, *Digester supernatant, Lime precipitation.

Digester supernatant contains high concentrations of nitrogen and phosphorus, also, poor quality supernatant discharged from an anaerobic digester can have an adverse effect on the overall efficiency of a waste water treatment plant. FMC Corporation undertook to build and demonstrate the operation of a unique, trailer-mounted, and completely self-contained pilot plant. The pilot plant is designed to investigate the improvement of digester supernatant quality, with particular emphasis on the removal of nitrogen and phosphorus. The pilot plant treatment sequence consists of carbon dioxide removal via air-stripping, lime precipitation of phosphorus and carbonaceous particulate matter, and removal of nitrogen by packed-tower ammonia-stripping. The pilot plant was operated over a two-month period at a trickling filter plant where two-stage anaerobic digestion is practiced. The pilot plant operated in a reliable and consistent fashion with respect to both the mechanical performance and the process data obtained. A wide range of operating conditions was investigated in a convenient and effective manner. It was found that 80-95% of supernatant phosphorus could be removed at a lime dosage equal to 50 pounds of hydrated lime per pound of phosphorus removed. Average ammonia-nitrogen removal was 82%, achieved at an air flow rate equal to 83,000 cubic feet of air per pound of NH3-N removed. Normal lime precipitation removed about one-half of the supernatant TOC, COD, and Organic Nitrogen. The average decrease in suspended solids was 64%.

PHOSPHORUS REMOVAL USING CHEMICAL COAGULATION AND A CONTINUOUS COUNTERCURRENT FILTRATION PROCESS,
Johns-Manville Research and Engineering Center, Manville, N. J.
G. R. Bell, D. V. Libby, and D. T. Lordi.
Available from NTIS as PB-196 734, $3.00 in paper copy, $0.95 in microfiche. Water Pollution Control Research Series 17010 EDO -- 06/70, June 1970. 58 p, 11 tab, 9 fig, 7 ref. FWQA Program 17010 EDO, Contract 14-12-154.

Descriptors: *Phosphates, *Waste water treatment, Electrolytes, Effluents, *Filtration, *Trickling filters, Municipal wastes, Sewage effluents, Sludge disposal, Biochemical oxygen demand.
Identifiers: *Phosphorous removal, Orthophosphates, Alum.

he Johns-Manville Moving Bed Filter, a continu-
us precipitation and countercurrent filtration
rocess, was evaluated for the removal of
iosphorus from municipal wastewater. Using
um and an anionic polyelectrolyte, the process
as found to effectively reduce total phosphorus
P), orthophosphate (OP) and condensed
iosphate (CP) over a wide range of influent
iosphorus concentrations. Preliminary work
ing jar tests established an alum dose of 200 mg/l
7.4 mg/l Al, molar ratio of Al/P is 27/31) as ef-
ctive for removal of 90 percent TP from the
condary clarifier effluent of a trickling filter
ant. This removal efficiency could not be
stained with an alum dose of 200 mg/l when
gher TP levels were encountered. With total
iosphorus concentrations on the order of 25 to 28
g/l as P (Al/P — 0.6-0.7), the TP removal effi-
ency averaged 90 per cent. With lower total
iosphorus concentrations, removal efficiency
eraged 95 per cent and ranged up to 99 per cent
l/P — 1.2-2.6). Substantial reductions in final ef-
ient total suspended solids (TSS) and 5-day
ochemical oxygen demand (BOD5) were also ob-
ined. At an alum dose of 200 mg/l, TSS reduction
eraged 70 per cent and BOD5 reduction 80 per
nt. If phosphorus removal were not a design con-
leration, the reduction of TSS and BOD5 could
achieved with lower alum doses. The 200 mg/l
um dose was also found to be equally effective for
moval of phosphorus from raw sewage and pri-
ary effluent with the added capability for remov-
g substantial portions of the TSS and BOD5. In
ort studies on these streams, effluent as good or
tter than the final effluent from the trickling
ant was obtained. Costs for a 1.0 MGD plant are
timated to be $264,000 for capital and 12.0 cents
r 1000 gal for total operating cost. These costs
ould be about the same for raw sewage, final ef-
ient or the two intermediate levels of prior treat-
ent studied. Ultimate disposal of the phosphorus-
ntaining sludge could be achieved by a dewater-
g and landfill operation. Dewatering by means of
rotary vacuum precoat filter would require an
timated capital expenditure of $30,000 and total
st would be 3 cents per 1000 gal of original waste
ater treated.

nced Waste Treatment Research Laboratory,
ncinnati, Ohio, December 1969. 88 p, 17 tab, 10
, 28 ref, 2 append.

escriptors: *Ion exchange, *Waste water treat-
ent, *Resins, Ions, Nitrates, Chlorides.
entifiers: *Nitrate ions, *Nitrate removal, Resin
nthesis, Weak-base resins, Resin regeneration,
n selectivity, Ion capacity, Styrenes, Chloride
n.

eparation of nitrate-specific ion-exchange resins,
hich incorporate selected primary amines grafted
to polystyrene, has been investigated. The best
lectivity for nitrate ion over chloride ions was ob-
ned with the 1-naphthylmethl-aminomethyl
rivative of polystyrene (1-NMA resin). Nitrate
s adsorbed quantitatively from feed solutions
ntaining five times as much chloride ion as
trate ion. Under identical conditions, commercial
eak-base resins removed only 70% of the nitrate
n. The 1-NMA resin could be regenerated re-
atedly in the chloride form by HCl, but attempts
alkaline regeneration led to irreproducible
sults. Recommendations for future work include
vestigation of the effects of cross-linking, addi-
n of hydrophilic functional groups, quaterniza-
n of the amine, and incorporation of different,
trate-selective, functional groups.

KINETICS AND MECHANISM OF PRECIPITATION AND NATURE OF THE PRECIPITATE OBTAINED IN PHOSPHATE REMOVAL FROM WASTE WATER USING ALUMINUM (III) AND IRON (III) SALTS,
Atomics International, Canoga Park, Calif.
Harold L. Recht, and Masood Ghassemi.
For sale by the Superintendent of Documents, U. S. Government Printing Office, Washington, D.C. 20402. Price $0.75. I67, 13/4; 17010 EKI 04/70 paper copy $0.75. Available from NTIS as PB-196 737, $0.95 in microfiche. Water Pollution Control Research Series 17010 EKI-04/70, Advanced Waste Treatment Research Laboratory, Cincinnati, Ohio, April 1970. 77 p, 29 fig, 4 tab, 9 ref. FWQA Program 17010 EKI, Contract 14-12-158.

Descriptors: *Phosphates, *Kinetics, Aluminum, Iron, *Waste water treatment, *Chemical precipitation, *Effluents, Chemical reactions.
Identifiers: *Phosphate removal, Aluminum salts, Iron salts, Orthophosphates, Secondary effluents.

An investigation was conducted of the rate, mechanism and stoichiometry of phosphate precipitation with aluminum and ferric salts from pure phosphate solutions and secondary effluent. These studies showed that the reactions of orthophosphate ion with both Al (III) and Fe (III) are completed in less than 1 second. The effects of pH, reactant concentration, and reagent aging on the efficiency of phosphate removal were evaluated in batch precipitation experiments. The pH of optimum athophosphate precipitation was found to be close to 6.0 for Al (III) and in the vicinity of 3.5 to 4.0 for Fe (III). With an initial orthophosphate concentration of 12 mg/l P, maximum phosphate removal was about 82% with Fe (III) and about 78% with Al (III) at a 1:1 molar ratio increasing to over 99% for both cations at a 2:1 ratio. At constant pH, with both Fe (III) and Al (III) up to about a 1:1 molar ratio, orthophosphate removal was directly proportional to amount of added cation, indicating occurrence of a chemical reaction. Dilute solutions of Fe (III) were found to undergo extensive hydrolysis on aging with a resultant loss of capacity to precipitate phosphate. The removal of condensed phosphates by precipitation with aluminum and iron salts was found to be strongly dependent on pH and the reactant concentration ratio. Precipitates obtained in the reaction of orthophosphate with aluminum and ferric salts were examined by X-ray diffraction analysis after drying and heating to 104C and to 600C. Both precipates remained amorphous, except that ferric phosphate was identified after ignition at 600C. (Selby-Texas)
W71-03457

PHOSPHATE REMOVAL FROM WASTE WATERS USING LANTHANUM PRECIPITATION,
Atomics International, Canoga Park, Calif.
Harold L. Recht, and Masood Ghassemi.
For sale by the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402. I67, 13/14; 17010 EFX 04/70 paper copy $0.75. Available the NTIS as PB-196 738, $0.95 in microfiche. Water Pollution Control Research Series 17010 EFX: 04/70, Advanced Waste Treatment Research Laboratory, Cincinnati, Ohio, April 1970. 45 p, 18 fig, 1 tab, 11 ref. FWQA Program 17010 EFX, Contract 14-12-183.

Descriptors: *Phosphates, *Waste water treatment, Turbidity, Aluminum, Hydrogen ion concentration, *Effluents, Chemical precipitation.
Identifiers: Phosphate removal, Secondary effluent, *Lanthanum, *Orthophosphates.

A parametric study was made of the removal of ortho- and polyphosphates from pure solutions and secondary effluent with La (III), and the results compared with those from similar tests with Al (III). The reactions of orthophosphate with both La (III) and Al (III), resulting in precipitate formation and phosphate removal, were complete in less than 1 sec. La (III) showed a broader effective pH range and lower residual phosphate concentration and thus proved to be far superior to Al (III) for phosphate, especially polyphosphate, precipitation. Within the pH range for optimal phosphate removal, the La (III)-phosphate reactions produced large, settleable flocs. Immediately outside this range, poorly settling fine turbidity developed. At pH levels above this region, some residual turbidity was generally observed. No turbidity or precipitation was observed at very low pH levels. At constant pH, orthophosphate removal was directly proportional to the La (III) PO4-3 molar ratio, with complete removal at a ratio of approximately 0.9. This strongly suggests that orthophosphate removal with La (III) occurs solely through a chemical reaction and not through an adsorption process. With secondary effluent, as with pure solutions, lower residual phosphate resulted over a wider pH range with La (III) than with Al (III); no pH adjustment is needed for effective removal with La (III), while considerable amounts of acid or excess Al (III) are required to achieve the optimum pH of 6 for phosphate removal. (Selby-Texas)

ULTIMATE DISPOSAL OF PHOSPHATE FROM WASTE WATER BY RECOVERY AS FERTILIZER,
Grace (W. R.) and Co., Clarksville, Md.
Maria G. Dunseth, Murial L. Salutsky, Kenneth M. Ries, and Joseph j. Shapiro.
For sale by the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402. Price $0.70. I67, 13/14; 170170 ESJ 01/70 paper copy $0.70. Availabile from NTIS as PB-196 739, $0.95 in microfiche. Water Pollution Control Research Series 17070 ESJ-01/70, Advanced Waste Treatment Research Laboratory, Cincinnati, Ohio, January 1970. 74 p, 24 tab, 18 fig, 13 ref. FWQA Program 17010 ESJ, Contract 14-12-171.

Descriptors: *Phosphates, *Waste water treatment, Fertilizers, Biochemical oxygen demand, Chemical oxygen demand, Effluents, Sewage effluents, *Water reuse.
Identifiers: Digester supernatant, *Orthophosphates.

Many of the proposed processes that reduce orthophosphate in the effluents from sewage treatment plants result in the extracted phosphate being concentrated in the digester supernatant. This phosphate must be removed prior to disposal of the supernatant or its recycle back to the head of the treatment plant. Digester supernatant was treated in two ways. The first was to add magnesia and elevate the pH to 9 to cause precipitation of the phosphorus. The other technique was to apply heat and/or vacuum to the digester supernatant which caused precipitation of the soluble orthophosphate. A 90% removal of orthophosphate can be achieved by either approach. The heat and/or vacuum process also yields a supernatant substantially lower in BOD, COD, and nitrogen concentration. The precipitated phosphorous (primarily a mixture of calcium phosphate and magnesium ammonium phosphate) was found available for plant food according to AOAC (i.e., Association of Official Agricultural Chemists) procedures. Work was conducted by bench and pilot plant studies on digester supernatant from the Lake Zurich, Illinois sewage treatment plant and from the Libertyville, Illinois sewage treatment plant. INTERNAL HYDRAULICS OF THERMAL DISCHARGE DIFFUSERS, A DISCUSSION,
Camp, Dresser and McKee, Boston, Mass.
Thomas R. Camp, and David S. Graber.
Journal of the Hydraulics Division, Proceedings of the ASCE, Vol No HY12, December 1970, p 2631-2637. 4 fig, 1 tab, 4 ref.

Descriptors: *Diffusion, *Hydraulics, *Pipe flow, *Discharge coefficients, Thermal pollution, Reynolds number, Model studies.
Identifiers: *Friction factor, Diffusers, Spacing ratios.

An article about planning and design of outfalls for mixing both waste water effluents and cooling water with fresh water streams is discussed in this paper. It is said that the authors of the original article have presented a much simpler alternative computational procedure for the design of such dispersion conduits, based on an analysis in which the lateral outflow and head losses are assumed to be distributed continuously along the length of the conduit. It is also assumed that the flow is uniformly decreasing along the length of the diffuser and the friction factor is constant. It is concluded that: the method studied provides a convenient means for the preliminary design of fresh water diffusers and for final evaluation of proposed designs. For major diffuser structures particularly, for configurations saving a nonconstant value of C', which is a discharge coefficient, the procedure would be essential for final evaluation. If the diffuser is to be used for varying flow conditions, m, the selected design ratio of discharge at the latter outlet to the discharge at the former outlet will change with discharge to a degree depending upon the change in f and C'. The accuracy required depends, on the accuracy to which m must be predicted, at being noted that m is relatively insensitive to changes in head loss if 1-m is small. (Herrera-Venderbilt)

ELECTRODIALYSIS IN ADVANCED WASTE TREATMENT,
Ionics, Inc., Cambridge, Mass.
J. D. Smith, and J. L. Eisenmann.
Available from NTIS as PB-174 925, $3.00 in paper copy, $0.95 in microfiche. Water Pollution Control Research Series WP-20-AWTR-18, Federal Water Pollution Control Administration, Robert A Taft Sanitary Engineering Center, Feb 1967. 219 p, 32 fig, 33 tab, 19 ref. FWPCA Project 17040---02/67.

Descriptors: *Electrodialysis, *Economics, Demineralization, Membranes, Scaling, Design, *Waste water treatment.
Identifiers: Deonization, Anion membranes.

To determine the practicality of partially demineralizing municipal waste water by electrodialysis, a bench-scale experiment was made, using filtration alone and filtration followed by carbon adsorption as pretreatments. Long-term runs were made with a muncipal secondary effluent to determine scaling and fouling effects of the water upon the electrodialysis membranes. A study was made during these runs to determine how high a ratio of product rate to concentrate rate could be obtained without forming scale on the membranes. Some fouling of anion membranes occurred with filtration and carbon adsorption pretreatment; without carbon adsorption, fouling was much worse. Scale formation was not a problem at product to concentrate ratios less than ten. At times much higher ratios were obtained without difficulty. The results of these runs indicated that the total operating cost for a 10-mgd electrodialysis treatment plant might be less than $.10 per 1,000 gal. (Selby-Texas)

ELECTROCHEMICAL TREATMENT OF MUNICIPAL WASTE WATER,
Pennsalt Chemicals Corp., Philadelphia, Pa.
H. C. Miller, and W. Knipe.
Available from NTIS as PB-168 794, $3.00 in paper copy, $0.95 in microfiche. Environmental Health Series AWTR-13, Advanced Waste Treatment Research Program, Public Health Service, Robert A Taft Sanitary Engineering Center, March 1965. 58 p, 14 tab, 6 fig, 15 ref. FWPCA Project 17020---03/65.

Descriptors: *Waste water treatment, *Electrochemistry, *Economics, Chemical oxygen demand, Activated sludge, Chlorides, Electrodes, Anodes, Alkylbenzene sulfonates, Municipal water.
Identifiers: Lead, Lead-silver alloys, Lead dioxide, Municipal waste water.

The effectiveness of electrolytic methods of treating waste water is in doubt. This study shows that an electrolytic treatment of secondary effluent from an activated-sludge plant using lead dioxide anodes can reduce ABS by 90%, COD by 80%, and chloride by 90%. This treatment has little effect on total solids. The cost of treatment will vary between $0.90 and $2.42 per 1,000 gallons. The plant costs will vary between $9 million and $26 million for a 10 mgd plant. The method is not considered economically practical for waste water renovation, wherein waters of relatively low conductivity must be processed. The authors also conclude that the work by the Lead Industries Association on the use of lead and lead-silver alloys in the treatment of waste waters should be followed since the results may have application in treating waste waters of relatively high conductivity. (Selby-Texas)

ADSORPTION OF BIOCHEMICALLY RESISTANT MATERIALS FROM SOLUTION 1,
Harvard Univ., Cambridge, Mass. Div. of Engineering and Applied Physics.
J. C. Morris, and W. J. Weber, Jr.
Available from NTIS as PB-168 799, $3.00 in paper copy, $0.95 in microfiche. Environmental Health Series AWTR-9, Advanced Waste Treatment Research Program, Public Health Service, Robert A Taft Sanitary Engineering Center, May 1964. 74 p, 40 fig, 7 tab, 16 ref. FWPCA Project 17020---05/64.

Descriptors: *Waste water treatment, *Adsorption, Activated carbon, Kinetics, Equilibrium.
Identifiers: Advanced waste treatment, Refractory materials.

The report is primarily a summary of research progress rather than a complete description of how adsorption may be used to optimum advantage. The studies on the kinetics of adsorption on granular carbon showed that: (1) Uptake from dilute solution proceeds slowly for compounds of high molecular weight, (2) The rate of adsorption is a linear function of the square root of concentration. This implies that the process favor removal of trace quantities, (3) Rates of adsorption decrease considerably with increasing size of adsorbate when the amount adsorbed per unit is expressed in molar units; when expressed in weight units, the effect is much less pronounced, (4) The configuration of the adsorbate molecule affects rate of uptake; molecules with highly branched structures are removed much more slowly than those of identical molecular weight but with a configuration that permits coiling or attainment of compactness, (5) Rates of adsorption per unit weight of carbon vary reciprocally as the square of the diameter of individual carbon particles, (6) The rate of adsorption of alkylbenzenesulfonates increases with decreasing pH of the solution. The findings correlate with equations derived for infraparticle diffusion, which indicates that the rate of adsorption is controlled by rate of diffusion of solute within the micropores of the carbon. Extension of this research, currently underway, should provide supplementary information that will be of considerable use in the final design of appropriate adsorption processes. (Selby-Texas)

ADSORPTION OF BIOCHEMICALLY RESISTANT MATERIALS FROM SOLUTION 2,
Robert A. Taft Sanitary Engineering Center, Cincinnati, Ohio.
J. C. Morris, and W. J. Weber.
Available from NTIS as PB-170 700, $3.00 in paper copy, $0.95 in microfiche. Environmental Health Series AWTR-16, Advanced Waste Treatment Program, Federal Water Pollution Control Administration, Robert A Taft Sanitary Engineering Center, March 1966. 108 p, 77 fig, 13 tab, 37 ref, 2 app. FWPCA Project 17020---03/66.

Descriptors: *Adsorption, *Activated carbon, Waste water treatment, Equilibrium, Kinetics, Pesticides.
Identifiers: Refractory materials, Regeneration, Advanced waste treatment.

As reported in PHS Publication No 999-WP-11-AWTR-9, earlier studies showed that activated carbon for waste water renovation could best be used in continuous-flow columns. Such techniques should result in an adsorptive capacity of greater than 10%. Results on studies of adsorption of organics from single-and multi-component systems in fluidized carbon are reported in these publications. The adsorbability of organic pesticides on activated carbon was investigated in some detail. Studies were undertaken to characterize those types of organic pollutants that are not adsorbed on activated carbon. The report concludes that if additional removal of organic matter beyond that now obtainable with reasonable depth of activated carbon is desired, one should follow the activated carbon with a contrasting type of adsorbent. (Selby-Texas)

FEASIBILITY OF GRANULAR ACTIVATED CARBON ADSORPTION FOR WASTE-WATER RENOVATION,
Pittsburgh Chemical Co., Pa.
R. S. Joyce, and V. A. Sukenik.
Available from NTIS as PB-169 383, $3.00 in paper copy, $0.95 in microfiche. Environmental Health Series AWTR-18, Advanced Waste Treatment Research Program, Public Health Service, Robert A Taft Sanitary Engineering Center, Oct 1965. 38 p, 17 fig, 10 tab, 2 ref. FWPCA Project 17020---10/65.

Descriptors: *Waste water treatment, *Activated carbon, *Adsorption, Flocculation, Chemical oxygen demand, Effluents, Sludge.

In the first interim report (AWTR-10, PHS Publication No. 999-WP-12) it was shown that treatment of secondary waste water effluent from an activated-sludge process with granular, activated carbon in a column process reduced COD content to concentrations between 12 and 20 ppm. ABS removal was essentially complete. The current study was initiated to determine if an increased contact time in the carbon bed, effected by a reduction in flow rate, would improve the degree of COD removal. In the study, granular activated carbon in packed-bed column contractors 20 feet deep and operated at a flow rate of 4 gpm per square foot reduced the COD to an average value of 18.5 ppm. This was not significantly different from removal obtained at a 10 gpm per square foot operating level. Typical adsorption isotherms for type SGL carbon for COD indicated capacities of approximately 35% by weight. Cyclic saturation and regeneration of activated carbon through 16 cycles had an average carbon loss of 4.6% of secondary effluent prior to carbon adsorption increased the adsorption capacity of carbon and resulted in much lower final levels of COD than the levels obtained with unflocculated effluent. EVALUATION OF VARIOUS ADSORBENTS AND COAGULANTS FOR WASTE WATER RENOVATION,
Ionac Chemical Co., Birmingham, N.J.
J. N. Williamson, A. H. Heit, and C. Calmon.

Available from NTIS as PB-170 741, $3.00 in paper copy, $0.95 in microfiche. Environmental Health Series AWTR-12, Advanced Waste Treatment Research Program, Robert A Taft Sanitary Engineering Center, Public Health Service, June 1964. 91 p, 20 tab, 9 fig, 10 ref, append. FWPCA Project 17020---06/64.

Descriptors: *Waste water treatment, Proteins, Anion exchange, Coagulation, Economics, Adsorption.
Identifiers: Minerals, Sludge blanket.

Certain inexpensive, commercially available materials were investigated to see if they hold promise in treatment of waste waters, especially secondary effluents. Activated carbon was used as a reference. Minerals treated with salts of tetravalent metals show promise for the organic-solute phase of secondary waste water effluents. Most conventional coagulants exhibit marked affinities for the refractory organic materials in these secondary effluent. Proteins show similar properties when coagulated in the presence of mineral acids and certain acid salts of trivalent metals. Hydrophobic proteins, aldehyde hardened in granular shape then further reacted with acids or acid salts, will also remove organic refractory contaminants from secondary effluents. Organic anion exchangers will also remove organic solutes from waste water. The problem of irreversible organic fouling requires more attention if exchangers are to be considered. Precoagulation of the higher molecular species of organics is suggested as a fouling preventive measure. This study demonstrated the mechanical feasibility of incorporating solid adsorbents into the sludge blanket process for water treatment in the presence or absence of coagulants. The sludge blanket process can combine the virtues of finely divided, large surface area forms of solids and flocs with the maintenance of relatively high flow rates, normally associated with columnar-bed techniques. Material cost factors are discussed for the various materials tested and for the treatments involving their use. Recommendations are made for possible further lines of investigation. (Selby-Texas)
W71-03508

ADVANCED WASTE TREATMENT BY DISTILLATION,
Badger (W. L.) Associates, Inc., Ann Arbor, Mich.
J. H. Neale.
Available from NTIS as PB-168 839, $3.00 in paper copy, $0.95 in microfiche. Environmental Health Series AWTR-7, Advanced Waste Treatment Research Program, Public Health Service, Robert A Taft Engineering Center, March 1964. 55 p, 8 fig, 12 tab, 4 ref. FWPCA Project 17080---03/64.

Descriptors: *Waste water treatment, *Distillation, Evaporation, Economics, *Scaling, *Corrosion.
Identifiers: *Advanced waste treatment.

In a desk-top study of scaling and corrosion effects, a municipal water re-use cycle was assumed in which sufficient waste water distillate would be mixed with waste water treated for organic contaminant removal only to give a mixture suitable for the municipal water supply. The study shows that the concentration of scaling materials is small enough that, in many cases, distillation at a temperature of 400F should be possible. An economic advantage over sea-water distillation would be expected. Potential corrosion problems exist. Continuous boiling experiments were carried out on Ann Arbor sewage to determine the fouling effects of organic contaminants. Distillation of secondary effluent at temperatures up to 250F should not result in fouling. Operation with primary effluent does not appear feasible without additional treatment for removal of suspended materials. The study concluded that (1) distillation appears to be practical and economically attractive, (2) a system combining distillation and adsorption could be used to produce water for direct reuse, (3) pretreatment required for scale control prior to distillation will vary, (4) cost of waste water renovation by distillation will be less than the cost of sea-water conversion, (5) distillation should be used in parallel with another, less expensive operation such as adsorption to achieve the lowest cost of product water, and (6) study of the application of distillation to advanced waste treatment should be continued, and a pilot study should be instituted. (Selby-Texas)

COST OF PURIFYING MUNICIPAL WASTE WATERS BY DISTILLATION,
Delaware Univ., Dover.
J. A. Gerster.
Available from NTIS as PB-168 978, $3.00 in paper copy, $0.95 in microfiche. Environmental Health Series AWTR-6, Advanced Waste Treatment Research Program, Public Health Service, Robert A Taft Sanitary Engineering Center, Nov 1963. 43 p, 10 tab, 6 fig, 36 ref. FWPCA Project 17080---11/63.

Descriptors: *Waste water treatment, *Distillation, *Costs, *Sea water, *Flash distillation, Municipal water.
Identifiers: Multi-stage flash equipment, Multiple-effect equipment, Recompression-flash equipment, Municipal waste water, Blowdown.

To estimate the cost of distillation of waste water, desk top studies were made with the types of equipment proposed for use with sea water. The estimates are based upon those for sea water, but are modified to conform with the differences in the modes of operation for the two feeds. The smaller concentration of scaling materials in waste water should allow distillation to be carried out at a higher temperature than can be used with sea water. The smaller total contaminant concentration results in a smaller boiling-point elevation. Because of the need to dispose of the blowdown permanently it is necessary to concentrate to a far greater extent than in the case of sea-water distillation. Three types of equipment--multi-stage flash, multiple-effect, and recompression flash--appear economically promising. For all types of equipment the cost for the distillation step alone is somewhat less than for sea water, but inclusion of costs for feed pretreatment and ultimate disposal of blowdown, bring the cost up to about that for sea water. (Selby-Texas)

CONTAMINANT REMOVAL FROM SEWAGE PLANT EFFLUENTS BY FOAMING,
Radiation Applications, Inc., Long Island City, N.Y.
E. Rubin, R. Everett, Jr., and J. J. Weinstock.
Available from NTIS as PB-168 797, $3.00 in paper copy, $0.95 in microfiche. Environmental Health Series AWTR-5, Advanced Waste Treatment Research Program, Public Health Service, Robert A Taft Engineering Center, Cincinnati, Ohio, December 1963. 56 p, 17 tab, 12 fig, 22 ref. FWPCA Project 17020---12/63.

Descriptors: *Waste water treatment, *Foaming, *Alkylbenzene sulfonates, Chemical oxygen demand, Sewage effluents, Detergents.
Identifiers: Volume reduction, Advanced waste treatment.

One of the refractory solutes present in most sewage plant effluents is the surface-active agent alkyl benzene sulfonate (ABS). The paper reports that ABS concentrations (based on methylene blue analysis) between 2.0 and 3.2 ppm in secondary effluent have been consistently reduced to between 0.3 and 0.5 ppm by use of air-to secondary effluent, volumetric-flow ratios between 7 and 3, correspondingly. A correlation has been demonstrated between residual ABS concentration and the volume of aeration air available per unit mass of ABS in secondary effluent. A 10 to 45% diminuation in COD was observed after foaming. Volume reductions in continuous equipment averaged about 125, and values up to 1,000 have been obtained. Total dissolved solids and chloride ions have been found to be unaffected by the foaming process. An increase in pH upon foaming suggests that weakly acidic substances are being removed. PART 1. A DESIGN STUDY OF FREEZING AND GAS HYDRATE FORMATION. PART 2. FEASIBILITY TESTS OF FREEZING,
Syracuse Univ., N.Y.
A. J. Barduhn, A. Rose, and R. F. Sweeny.
Available from NTIS as PB-168 798, $3.00 in paper cipy, $0.95 in microfiche. Environmental Health Series AWTR-4, Advanced Waste Treatment Research Program, Public Health Service, Robert A Taft Sanitary Engineering Center, October 1963. 45 p, 10 tab, 8 fig, 19 ref. FWPCA Project 17080---10/63.

Descriptors: *Waste water treatment, *Freezing, Economics, Pre-treatment (Water), Chemical oxygen demand, Alkyl benzene sulfonate, Sea water, Municipal waste.
Identifiers: *Advanced waste treatment, *Gas hydration.

In a preliminary design to renovate municipal waste waters, freezing and gas hydrate processes for demineralizing sea water are adapted. The author of part one, assuming a feed material containing 1,000 parts total dissolved solids per million, predicts costs for recovering 92% of the feed as potable water. The waste stream can be further concentrated under eutectic conditions to produce more water and a waste stream of damp solids. In part 2, during 14 actual freezing tests completed, chemical oxygen demand was reduced 65 to 85%; chlorides 85 to 90%; and conductivity, 90% or more. Reduction of alkyl benzene sulfonate was erratic. With data from the better test runs, preliminary cost estimates indicate that 95% of the feed water containing 10% of the contaminants can be recovered at a cost somewhat lower than that predicted for desalinating sea water by freezing. SUMMARY REPORT, ADVANCED WASTE TREATMENT, JULY 1964-July 1967.
Federal Water Pollution Control Administration, Cincinnati, Ohio.

Available from NTIS as PB-179 515, $3.00 in paper copy, $0.95 in microfiche. Water Pollution Control Research Series WP-20-AWTR-19, Advanced Waste Treatment Branch Division of Research, Robert A Taft Engineering Center, 1968. 96 p, 17 tab, 36 fig, 24 ref, append. FWPCA Project 17000---07/68.

Descriptors: *Waste water treatment, Nutrients, Lime, Utlimate disposal, Activated carbon, Electrodialysis, Ion exchange, Reverse osmosis, Denitrification, Electrochemistry, Foaming, Solvent, Extractions, Distillation, Freezing.
Identifiers: *Advanced waste treatment, *Lime clarification, Suspended solids removal, Organic removal, Inorganic removal, Nutrient removal, Granular carbon, Powdered carbon, Air stripping.

The report summarizes results of advanced waste-treatment studies from July 1964 to July 1967. A wide range of waste water treatment processes have been evaluated under the program for technical and economic feasibility. These methods include processes for suspended solids removal, organic and inorganic removal, nutrient removal, and ultimate disposal of concentrated end products. A number of processes have been studied extensively enough to assess their feasibility to a fair degree of accuracy. For waste waters, with appropriate contaminant composition, lime clarification will effectively remove suspended solids and the nutrient phosphate and the economics are expected to be favorable. Alum clarification is expected to be a successful method at a cost of 8 cents/1,000 gal. or less for a 10-mgd plant. For organic removal, activated-carbon treatment is very promising. Granular-carbon treatment without clarification of the feed can be carried out for about 8 cents/1,000 gal. at the 10-mgd level. Powdered-carbon treatment should cost about 12 cents/1,000 gal. at the 10-mgd level, provided carbon can be reactivated, with process improvements probably reducing the costs. For removal of gross inorganic content, electrodialysis should be possible for about 16 cents/1,000 gal in a 10-mgd plant. Other inorganic removal processes such as ion exchange and reverse osmosis may be competitive with electrodialysis. An air-stripping process for ammonia appears technically feasible and should not cost over 2 cents/1,000 gal for a 10-mgd plant, excluding cost of adjustment of pH to 10 or above. Initial study of denitrification of a highly nitrified effluent or granular activated carbon shows promise for nitrate removal. Study of a number of processes given preliminary evaluation has been halted for the present because of certain unfavorable characteristics. These processes include electrochemical treatment, foaming, solvent extraction, distillation and freezing. (Selby-Texas)

REMOVAL OF PHOSPHATES BY SORPTION ON ACTIVATED ALUMINA,
Missouri Water Resources Research Center, Columbia.
Krishnier Purushothaman, and C. M. Yue.
Available from NTIS as PB-196 872, $3.00 in paper copy, $0.95 in microfiche. Completion Report, Missouri Water Resources Research Center, December 30, 1970. 79 p, 7 tab, 26 fig, 31 ref. OWRR Project A-029-MO (1).

Descriptors: *Phosphates, *Sorption, *Activated alumina, *Eutrophication, Tertiary treatment, Waste water treatment, Water pollution effects, Ions.
Identifiers: Alcoa alumina, *Freundlich equation, *Phosphorous removal, Ion removal.

The purpose of this investigation was to study the removal of phosphorus from waste water by sorption on activated alumina, and determine the capacity of the alumina to sorb phosphates in the presence of other ions, the effect of the influent flow rate and phosphorus concentration on the efficiency of the process, and the feasibility of regeneration of the used alumina. The studies were conducted using deionized and tap water to which inorganic phosphate had been added, and secondary effluent from bench-scale activated sludge units. They involved batch tests employing three types of activated alumina, ALCOA XM (minus 325 mesh), F-1 (minus 100 mesh), and F-1 (28-48 mesh), and continuous-flow tests carried out in three specially designed glass sorption columns using the F-1 (28-48) alumina. Activated alumina was found to have a greater capacity for removing phosphorus in the presence of hardness-causing ions, and each type of alumina had a different capacity for each test water used. The fraction of phosphorus removed by each alumina decreased when the initial phosphorus concentration in the test water increased. The influent flow rate inversely affected the phosphorus loading capacity of the alumina, and the used aluminas could be effectively regenerated with a 2M sodium hydroxide solution alone.

PAB PROCESS FOR ADVANCED WASTE TREATMENT,
Iowa State Univ., Ames. Engineering Research Institute.
Robert L. Johnson, and E. Robert Baumann.
Available from NTIS as PB-196 146, $3.00 in paper copy, $0.95 in microfiche. Iowa State Water Resources Research Institute, Completion Report, ISU-ERI-AMES-91100, ERI Project 756-S, December 1970. 42 p, 11 tab, 11 fig, 20 ref. OWRR Project A-025-IA (2).

Descriptors: *Adsorption, *Refractivity, *Tertiary treatment, *Waste water treatment, Effluents, Sewage effluents, Organic wastes.
Identifiers: Refractory organics, Pulsed adsorption bed, Total organic carbon, Biological metabolism, *Organic waste removal.

A NEW TERTIARY TREATMENT PROCESS HAS BEEN DEVELOPED UTILIZING THE PHYSICAL—CHEMICAL ADSORPTION OF SOLUBLE AND COLLOIDAL ORGANIC MATERIAL IN THE DILUTE FINAL EFFLUENTS OF SECONDARY BILOGICAL PROCESSES ONTO GRANULAR MEDIA. The refractory organic material thus concentrated can be utilized by microorganisms growing at the interface of the media in the psuedo-high concentration substrate. A significantly greater biological oxidation and synthesis of the residual organic material in the waste water is thus achieved and the interface is continuously regenerated. The waste water and air flow co-currently upward through a media bed. The air provides oxygen for biological activity and agitation of the media bed to prevent clogging. The rising air bubbles impact a periodic or pulsed motion to the media bed. Thus, the process was named the PULSED ADSORPTION BED (or PAB) PROCESS. The PAB process was developed first on a laboratory scale using synthetic sewage, and then with a pilot plant using trickling filter plant final effluent. Hydraulic loading rates of 125 and 220 MGAD were used in the laboratory and up to 100 MGAD in the field operation of the pilot plant. Corresponding organic loading rates were approximately 300 pounds BOD/1000 cubic feet/day. The PAB process coupled with solids separation units such as mixed media filters can provide 70 to 90 percent removal of the organic material in the final effluent from conventional complete treatment facilities. A combined solids treatment system could be designed, constructed and operated at a total annual cost of approximately 4 cents/1000 gallons.

MANPOWER SUPPLY IN WASTE WATER TREATMENT PLANTS,
Purdue Univ., Lafayette, Ind. Water Resources Research Inst.
L. N. Smith, and W. L. Miller.
Available from NTIS as PB-196 875, $3.00 in paper copy, $0.95 in microfiche. Purdue University Water Resources Research Center Technical Report No. 15, August 1970. 90 p, 1 fig, 15 tab, 22 ref. OWRR Project A-011-IND (1).

Descriptors: *Manpower, Employment opportunities, *Labor supply, Occupations, Resource allocations, *Waste water treatment, Wages.
Identifiers: Waste water treatment plant operators.

The research attempts to answer the question whether enough trained men will be available who are willing to work in the waste water treatment industry under present and projected economic conditions. The quantity of waste water treatment plant operators was postulated to be a function of wages, alternative wages, population, unemployment, and recent hirings. Simple equation, linear regression procedures based on cross sectional data, were used to estimate the operator supply functions. The analysis concludes that two variables appear to be significant in explaining the quantity of operators supplied, that is, wages and population. Projections for two regions in Indiana and for the State as a whole were made for 1972. The conclusions suggest managers have several alternatives to insure enough skilled and trained operators will be available. These alternatives include the change in wages and population variables suggested by the analysis of the supply function in this study and other techniques, such as, employing one operator full time to service a few small plants in the same geographic area or the training of additional operators. FLOW PROPERTIES OF ANIMAL WASTE SLURRIES,
Pennsylvania State Univ., University Park.
Mahesh Kumar, H. D. Bartlett, and N. N. Mohsenin.
Paper presented at the 1970 winter meeting American Society of Agricultural Engineers, Chicago, Dec 8-11, 1970, Paper No 70-911. 28 p, 7 fig, 2 tab, 26 ref.

Descriptors: *Slurries, *Viscosity, *Viscometers, Farm wastes, Viscous flow, Temperature, *Flow characteristics, Moisture content, Shear strength.
Identifiers: Shear diagrams, Flow behavior indices, Dilution, Pseudoplastic flow, Apparent viscosities, Newtonian fluids, Total solids.

The flow properties of animal waste slurries were studied with the use of a coaxial cylinder-type viscometer to determine shear diagrams, flow behavior indices, viscosity indices and apparent viscosities in relation to dilution, temperature and sawdust bedding content of the slurries. The viscosity of manure slurry decreases with increase in dilution. Flow is Newtonian for total solid content below five per cent. Addition of sawdust decreases the viscosity of slurries. Viscosity of fresh manure decreases with increase of temperature. Manure slurry of four to six percent total solids content is a good compromise between excessive volume of handling and power requirement. (Christenbury-Iowa State)

REDUCING THE POLLUTION POTENTIAL OF LIVESTOCK WASTES WITH IN-THE-BUILDING OXIDATION DITCHES,
Cornell Univ., Ithaca, N.Y. Dept. of Agricultural Engineering.
D. L. Day.
In: Relationship of Agriculture to Soil and Water Pollution; Proceedings, Cornell University Conference on Agricultural Waste Management, Rochester, January 19-21, 1970. Ithaca, 1970, p 77-84. 11 fig, 3 ref.

Descriptors: *Farm wastes, Oxidation lagoon, Irrigation, Aeration, Biochemical oxygen demand, Odor, Aerobic treatment, Labor, Rotors, Denitrification, Coagulation, Effluent.
Identifiers: *Oxidation ditch, *Slotted floors, Aerator, Clarifier.

A low-odor, low-labor, system of managing livestock wastes from animal to field is discussed. The system consists of (1) a confinement building for livestock, with self-cleaning, slotted floors; (2) an oxidation ditch beneath the slotted floors; (3) a nonoverflow of mixed liquor from the oxidation ditch; and (4) irrigating equipment for removing surplus liquids and solids from the lagoon and distributing them on nearby land when convenient for the operator. This system greatly improves the quality of the waste water, but without further treatment the waste water would probably not meet quality criteria for the receiving water. Thus the main advantages of the system are: low labor, low odor, low stream-pollution potential, and operator convenience. (See also W71-03542) (White-Iowa State)

THE CONCEPTUAL DESIGN OF AN ECONOMICALLY FEASIBLE ANIMAL WASTE DISPOSAL SCHEME,
Resource Engineering Associates, Wilton, Conn.
R. W. Okey, and R. N. Rickles.
In: Relationship of Agriculture To Soil and Water Pollution; Proceedings, Cornell University Conference on Agricultural Waste Management, Rochester, January 19-21, 1970, Ithaca, 1970, p 85-97. 11 tab, 4 fig, 11 ref.

Descriptors: *Farm wastes, *Cattle, *Biological treatment, Treatment facilities, Capital costs, Operating costs, Installation costs, Sludge, Centrifugation, Denitrification, Phosphorus, Nitrogen, Incineration, Biochemical oxygen demand, Chemical oxygen demand.
Identifiers: *Feedlot, Population equivalent, Waste management, Clarifer, Transport system.

Based on earlier work, a complete system for the capture, transport and treatment of the wastes from a 25,000 animal lot was presented. System capital costs are seen to be about $1.00 - $2.00/ton, and operating costs are around $3.00 - $4.00 per ton of wet waste. These costs result in a cost/lb gained of less than half a cent to about a cent. The costs for the least expensive system are an order of magnitude below feed costs. The installation costs are in the order of $15.00 to $40.00/animal or less than the capital cost as the least expensive confinement scheme. Economic feasibility is a combination of many things. One of the most important is the relevance of a particular item when all the costs are considered. The costs of waste treatment at feedlots would appear to represent roughly the same fraction of the total costs as seen in other industries. (See also W71-03542) (White-Iowa State)
W71-03546

THE ECONOMICS OF STORING, HANDLING AND SPREADING OF LIQUID HOG MANURE FOR CONFINED FEEDER HOG ENTERPRISES,
M. F. McKenna, and J. H. Clark.
In: Relationship of Agriculture to Soil and Water Pollution; Proceedings, Cornell University Conference on Agricultural Waste Management, Rochester, January 19-21, 1970, Ithaca, 1970, p 98-110. 12 tab.

Descriptors: *Farm wastes, *Hogs, *Storage capacity, Chemical analysis, Fertilizers, Storage tanks, Value, Soil contamination, Nitrogen, Phosphorus, Potassium, Nutrient requirements, Linear programming.
Identifiers: *Spreading, Seasonal application, Disposal costs.

The main hypothesis made at the outset of the study, that the economically optimal storage capacity would be affected by the density of hogs per acre and the crops under cultivation on the farm was supported. Of these two factors it was found that the ratio of hogs per acre was the more significant. For a spreading operation with the relatively high fixed costs associated with spreading, farms with smaller herd sizes were seen to encounter significantly higher spreading costs per hog than farms with larger herds. In some cases the extent of these costs will be sufficient to cancel out the positive value of the manure as a replacement for commercial fertilizer. It would therefore appear that significant savings might be realized if hog operators were to enter rental or custom arrangements for manure spreading. The overall conclusion reached in the study was that for Ontario conditions a land utilization program for the liquid manure supply does represent an economic means of handling the animal waste management problem. LAND DISPOSAL OF DAIRY FARM WASTE,
Florida Univ., Gainesville. Dept of Agricultural Engineering.
A. R. Overman, C. C. Hortenstine, and J. M. Wing.
In: Relationship of Agriculture to Soil and Water Pollution; Proceedings, Cornell University Conference on Agricultural Waste Management, Rochester, January 19-21, 1970, Ithaca, 1970, p 123-126. 3 fig, 2 ref.

Descriptors: *Farm wastes, *Cattle, Dairy industry, Effluent, Nitrogen, Phosphates, Soil contamination, Groundwater, Water pollution, Florida, Sprinkler irrigation, Rates of application, Nitrate, Oats, Waste disposal.
Identifiers: *Dairy cattle, Land disposal.

Wastes from 160 cows in a new milking barn at the University of Florida are collected in a 20,000-gallon holding tank and removed daily. An open impeller pump is used to deliver effluent to sprinkler guns which apply 1/4, 1/2, and 1 inch per week. The plots were seeded to oats, with no mineral fertilizer added. Measurements were taken to determine effectiveness of the oats in utilizing nutrients. Groundwater samples were extracted weekly at depths of 30,45, and 60 cm. for chemical analysis. Results are reported for nitrate and orthophosphate content. It is concluded that the soil plant system can be effective in renovation of waste water farm animal operations. Removal of nitrogen and phosphorus is greatly enhanced by plant growth. Nutrient removal was found adequate up to an application rate of 1 inch per week effluent with solids content of about 0.115 percent. It appears that a more intense application rate could be used. W71-03548

NITROGEN TRANSFORMATIONS AND PLANT GROWTH AS AFFECTED BY APPLYING LARGE AMOUNTS OF CATTLE FEEDLOT WASTES TO SOIL,
Southwestern Great Plains Research Center, Bushland, Tex.
A. C. Mathers, and B. A. Stewart.
In: Relationship of Agriculture to Soil and Water Pollution; Proceedings, Cornell University Conference on Agricultural Waste Management, Rochester, January 19-21, 1970, Ithaca, 1970, p 207-214. 8 fig, 2 tab, 3 ref.

Descriptors: *Farm wastes, *Cattle, *Nitrification, Denitrification, Nitrate, Nitrogen, Ammonia, Carbon dioxide, Greenhouses, Laboratories, Carbon,

Rates of application, Incubation, Phosphorus, Potassium.
Identifiers: *Feedlots, *Nitrogen transformations, Pullman silty clay loam, Yield.

The objectives of these studies were: (1) to determine the decomposition rates and nitrogen transformations of animal wastes when applied to soil at various rates; and (2) to study the effects on plant growth of applying large amounts of animal wastes to soil. Studies were carried out with 0, 1, 2.5, 5, 10, and 20% rates of cattle feedlot waste added to Pullman silty clay loam in both laboratory and greenhouse tests. Three conclusions were reached: (1) When feedlot waste was mixed with soil, evolution of C and transformation of N were rapid. In 90 days, about 50% of the C was evolved as CO2 and an equivalent amount of N was recovered as NH3 evolved, or as NH4.. and NO3- in the soil. (2) Nitrification was influenced by application rate of manure and moisture content of the soil during incubation. (3) In a greenhouse study, one unit of N from ammonium nitrate was equivalent to 2.4 units of N supplied in feedlot waste. (See also W71-03542) (White-Iowa State)

POULTRY POLLUTION: PROBLEMS AND SOLUTIONS.
Michigan Agricultural Experiment Station, East Lansing.

Research Report 117, Farm Science, July 1970. 55 pages.

Descriptors: *Farm wastes, *Poultry, *Dehydration, Eggs, Nitrogen, Diets, Feeds, Odor, Water pollution, Air pollution, Soil contamination, Disease, Insects, Standards, Land use, Septic tanks, Sludge disposal, Digestion, Ventilation, Rates of application, Corn, Nitrate, Chemical properties, Drying, Moisture content, Nutrients, Taste.
Identifiers: Environmental quality, Indoor lagoons, Laying hens, Feed conversion, Egg production, Dehydrated poultry waste, Feed efficiency.

The report contains eleven articles with an introduction and a table compilation of properties of poultry waste that were analyzed. Reports on indoor septic handling of poultry manure and effect of application rate of chicken manure on corn yields are presented. A large part of the report deals with drying and feeding poultry manure to laying hens. Results of feeding dehydrated poultry waste to laying hens and its effect on egg production, feed conversion, body weight, egg weight, shell thickness, Haugh score, egg taste, and quality changes during storage are presented. Acceptability and digestibility of poultry and dairy wastes by sheep is also reported. Bacteriological procedures and current research being carried out at Michigan State University conclude the report. (See also W71-03556 thru W71-03564) (White-Iowa State)

POULTRY MANURE HANDLING BY INDOOR SEPTIC TANKS (SO-CALLED 'INDOOR LAGOONS'),
Michigan State Univ., East Lansing. Dept. of Poultry Science.
J. A. Davidson, and C. J. Mackson.
In: Research Report 117, Farm Science, MSU Agricultural Experiment Station, July 1970, p 8-9.

Descriptors: *Farm wastes, *Poultry, *Septic tanks, *Sludge, Sludge disposal, Digestion, Odor, Ventilation.
Identifiers: *Indoor lagoons, Laying hens, Compressed air agitation, Paddle wheel agitation, Floor space.

The report details the use of shallow water filled tanks for the disposal of poultry manure. The experiment was carried on for 5 years, during which time several variations were used. The original experiment consisted of a tank 10' x 24' x 2' deep in a pen 20' x 24'. The tank was filled with 18" of water and all droppings were caught in the tank. The second year, compressed air was used to agitate the material. Approximately 9 inches of sludge was cleaned out after 11 months of operation. Flies were no problem. Successive experiments used different amounts and methods of agitation. Each year the sludge accumulation was cleaned out with a septic tank service truck. Indoor septic tanks (indoor lagoons) covering 1/2 the floor space can handle the droppings from 300 laying hens for at least 11 months. This means one annual cleaning. This method could be used in cage operations. (See also W71-03555) (White-Iowa State)
W71-03557

THE EFFECT OF APPLICATION RATE OF CHICKEN MANURE ON THE YIELD OF CORN,
Michigan State Univ., East Lansing. Dept. of Poultry Science.
L. S. Robertson, and John Wolford.
In: Research Report 117, Farm Science, MSU Agricultural Experiment Station, July 1970, p 10-15. 4 tab.

Descriptors: *Farm wastes, *Poultry, *Chemical properties, *Rates of application, Hydrogen ion concentration, Phosphorus, Potassium, Soil tests, Corn, Crop production, Michigan, Nitrate, Magnesium, Carbon.
Identifiers: *Plant food content, Huron County Michigan.

The report begins by giving an indication of the magnitude of the poultry manure problem in Michigan. Tables showing the chemical characteristics and plant food content of chicken manure are presented. The effect of high rates of manure application upon soil test results are shown. The application of 46.4 tons/acre of manure significantly increased the levels of phosphorus, potassium, magnesium, nitrate, and percent of carbon in the soil. At the same time, the pH level was reduced from 7.7 to 7.1. An experiment involving different rates of poultry manure application, one fertilizer application, and no treatment was used to determine the effect of chicken manure on corn grain yield. The use of commercial fertilizer did not increase corn yields. Previous field management made this result expected. The use of several rates of manure has not greatly affected the yields. The use of 46.4 tons/acre tended to decrease corn yields slightly. It is not known at the present time whether this apparent depression is real. The data suggest that a tremendous iuantity of chicken manure can be incorporated into the soil without any opportunity for damage to a corn crop. (See also W71-03555) (White-Iowa State)
W71-03558

DRYING ANIMAL WASTE,
Michigan State Univ., East Lansing. Dept. of Agricultural Engineering.
T. C. Surbrook, J. S. Boyd, and H. C. Zindel.
In: Research Report 117, Farm Science, MSU Agricultural Experiment Station, East Lansing. July 1970, p 16-20. 5 tab, 1 fig.

Descriptors: *Farm wastes, *Poultry, *Cattle, *Hogs, *Drying, Moisture content, Nutrients, Bulk density, Costs, Screens, Electric power.
Identifiers: *Dryer operation, Hammermill, Drying chamber, Fuel consumption.

The report gives details and test results from a machine used for drying animal waste. Production figures for the drier while processing different kinds of animal excreta are given. Details of the drier operation are described. Initial moisture contents ranged from 72 to 82 percent. The machine incorporates inclined shaking surfaces and screens, a hammermill and temperatures from 200 to 1100F. The drier successfully processed dairy, beef, swine and poultry excreta. Costs to produce one ton of the dried product are given. A table gives projected numbers of animals which the machine might serve. Density and nutrient levels of the dried excreta are listed. Odors were less intense than that of fresh excreta. (See also W71-03555) (White-Iowa State)
W71-03559

THE UTILIZATION OF POULTRY WASTE AS A FEEDSTUFF FOR GROWING CHICKS,
Michigan State Univ., East Lansing. Dept. of Poultry Science.
C. J. Flegal, and H. C. Zindel.
In: Research Report 117, Farm Science, MSU Agricultural Experiment Station, July 1970, p 21-28. 5 tab, 21 ref.

Descriptors: *Farm wastes, *Poultry, *Dehydration, Amino acids, Analysis, Chemical properties, Diets, Nutrients, Bacteria, Feeds, Efficiencies, Weight, Mortality.
Identifiers: *Feed composition, Dehydrated poultry waste, Significance, Feed efficiency.

Two experiments were conducted to determine the nutritional value of dehydrated poultry waste (DPW) for growing chicks from 1 to 28 days of age. The four-week mean body weight of Leghorn type chicks was not influenced when up to 20 percent of the diet consisted of the DPW. Diets which contained levels of 10 and 20 percent DPW, when fed to broiler-type chicks, resulted in a reduction in four-week mean body weight; 5 percent DPW had no influence on the four-week mean body weight. Food efficiency was inversely related to the level of DPW in the diet; i.e., the higher the level of DPW, the poorer the feed efficiency. However, in the trial in which broiler-type chicks were used, added fat placed in the diet which contained 20 percent DPW improved weight gain and feed efficiency. It is suggested that the DPW used in these trials was a low energy product. (See also W71-03559) (White-Iowa State)
W71-03560

THE RESULT OF FEEDING DRIED POULTRY WASTE TO LAYING HENS ON EGG PRODUCTION AND FEED CONVERSION,
Michigan State Univ., East Lansing. Dept. of Poultry Science.
C. J. Flegal, and H. C. Zindel.
In: Research Report 117, Farm Science, MSU Agricultural Experiment Station, July 1970, p 26-30. 2 tab.

Descriptors: *Farm wastes, *Poultry, Eggs, Feed, Diets, Corn, Lipids, Calcium, Phosphorus.
Identifiers: *Egg production, *Feed conversion, Dried poultry waste, White Leghorn layers.

Four replicates of eight birds each were fed one of thirteen possible diets which were presented in tabular form. The 416 White Leghorn type layers were on test for 139 consecutive days. Each hen was confined in an individual cage having a floor area of 8 x 16 inches. The percent egg production on a hen housed basis and kilos of feed per dozen eggs produced are also presented in tabular form. These data are presently being statistically analyzed to determine the differences, if any, between the various treatments. It appears that hens receiving control rations containing 10, 20, and 30 percent dried poultry waste have respectively lower production and higher feed requirements per dozen eggs. (See also W71-03559) (White-Iowa State)

ight, Egg weight, Shell thickness, Haugh score,
nificant difference.

his egg production experiment, one replicate of
twenty-six-week-old Leghorn type pullets was
ced on each of five different rations. The rations
ied from 0% to 40% dehydrated poultry waste
PW) plus fat. The production trial was con-
cted for 366 days with the birds in individual
es on a 15-hour-per-day light schedule. Protein-
rogen supplied in each of the rations was calcu-
d to be equal. The highest percent egg produc-
n resulted in those birds which received 10%
W in the ration. Although production varied
n 61.62% to 53.16% production, there was no
nificant difference in hen housed production.
d efficiency again was inversely proportional to
amount of DPW in a ration, with the best effi-
ncy having 0% DPW in the ration. However, an
lition of animal fat to the ration resulted in a
ht improvement in feed efficiency. It is also in-
esting to note that those birds which received
re than 10% DPW in their diet did not increase
body weight comparable to the control ration.
e egg weight became smaller as the percent of
W was increased in the diet. These differences
e not significantly different. Although there
e slight differences in shell thickness, again
re were no significant differences due to the diet
ny of these rations. All of the experimental ra-
s had a significantly higher Haugh score than
control diet. The Haugh scores ranged from
7 to 76.8. (See also W71-03555) (White-Iowa

nsumer Preference Panel.

ltry feces, from caged layers, were collected
dried. The resulting product was designated as
ydrated poultry waste (DPW). DPW was fed at
ary levels of 10, 20 and 30 percent to Single
nb White Leghorns in individual wire cages. A
e-type laying diet was used as a control. The
s were fed for four months before any eggs were
ected for taste panel evaluation. Eggs from
h treatment group were hard-cooked and
pared for a Consumer Preference Panel. The
s were evaluated on the basis of taste difference
then ranked for preferred taste. The dietary
ls of DPW fed had no significant (pA.05) effect
he taste of eggs. Panel members were unable to
ct any consistent taste difference for the DPW
control eggs. Two thirds of the time, panel
nbers liked the taste of the DPW eggs over the
e of the control eggs. In each ranking test, panel
nbers preferred the control eggs over the DPW
s. (See also W71-03555) (White-Iowa State)

CEPTABILITY AND DIGESTIBILITY OF ULTRY AND DAIRY-WASTES BY SHEEP,
higan State Univ., East Lansing.
. Thomas.
Research Report 117, Farm Science, MSU
icultural Experiment Station, July 1970, p 42-
2 tab.

Descriptors: *Farm wastes, *Poultry, *Sheep, *Cattle, Protein, Nitrogen, Animal metabolism, Digestion, Cellulose, Lignins, Fiber, Diets.
Identifiers: Total digestible nutrients, Dry matter, Digestibility, Soybean meal, Nutritive value.

Dried poultry and dairy wastes as about one third the total mixed ration were readily accepted by sheep. The complete ration was about 60% digestible with a TDN value of about 56. The digestibility of the poultry feces was more than that of the dairy feces. Protein of these wastes was less digestible than that of soybean meal but had a biological value equal to that of soybean meal for growing sheep. (See also W71-03555) (White-Iowa State)

OXYGENATION CAPACITIES OF OXIDATION DITCH ROTORS FOR CONFINEMENT LIVESTOCK BUILDINGS,
Illinois Univ., Urbana. Dept. of Agricultural Engineering.
Don D. Jones, Donald L. Day, and James C. Converse.
Purdue University, Engineering Extension Service, Bulletin No. 135, p 191-208. 12 fig, 5 ref. Proceedings 24th Industrial Waste Conference.

Descriptors: *Dissolved oxygen, *Oxygenation, Farm wastes, Equipment, Odor, Mass transfer, Theoretical analysis.
Identifiers: *Oxidation ditch, Alpha factor.

The oxidation ditch is one of the most successful methods for treating the staggering volume of animal manure that is being produced at the present time. The purpose of this paper is to present the oxygenation capacities of five aeration rotors tested at the University of Illinois. The rotors were tested in actual field installations with clean tap water in the ditch and the livestock removed. The parameter studies were blade immersion, blade design, rotor speed, and gross power requirements. There is little or no difference in oxygenation capacities between the angle iron bladed rotor and the rectangular plate rotor. The increase in oxygenation capacity is almost linear with depth of immersion or rotor speed. (Christenbury-Iowa State)

PRELIMINARY RESULTS OF A NOVEL BIOLOGICAL PROCESS FOR TREATING DAIRY WASTES,
Allis-Chalmers Manufacturing Co., Milwaukee, Wis.
Ronald L. Antonie, and Fred M. Welch.
Purdue University, Engineering Extension Service, Bulletin No. 135, p 115-126, 1969. Proceedings 24th Industrial Waste Conference.

Descriptors: *Equipment, *Aerobic conditions, *Biological treatment, *Biomass, Farm wastes, Aeration, Microorganisms, Biodegradation, Chemical oxygen demand.
Identifiers: *Loading rate, Rotating Biological Contractor, Field test.

Field testing of a device called the 'Rotating Biological Contractor' or 'RBC' is the subject of this paper. The device consists of a series of discs which are mounted on a shaft and rotated while partially submerged in the waste to be treated. A microbial film develops on the surface of the discs. The rotation of the discs carry the microorganisms into the air for aeration so that they can carry on aerobic activity. The field tests have shown that the RBC can effectively treat waste from a dairy plant. Varying weather conditions have no apparent effect on RBC effectiveness. RBC characteristics of a large microbial population, flexible aeration capacity, little maintenance, low power requirements and predictable performance make the RBC an attractive process for biological treatment of dairy wastes. (Christenbury-Iowa State)

MISSION IMPOSSIBLE: DISPOSE ANIMAL WASTES,
Ohio State Univ., Columbus. Dept. of Agricultural Engineering.
E. Paul Taiganides.
Purdue University, Engineering Extension Service, Bulletin No 135, p 542-549, 1969. 1 fig, 4 tab, 10 ref. (Proceedings 24th Industrial Waste Conference).

Descriptors: *Transportation, *Disposal, *Management, Farm wastes, Lagoons, Production, Anaerobic digestion, Aerobic treatment, Biochemical oxygen demand, Gases, Dehydration, Odor.
Identifiers: *Generation, *Processing, *Utilization, Waste management, Anaerobic lagoons, Gas production, Composting.

The development of a 'waste management technology' analogous to the new patterns of animal production and in harmony with our need to keep our natural resources from being polluted is not an impossible mission but rather a challenging mission whose resolution is requiring of engineers and scientists the same ingenuity that has been shown in developing modern methods of production of consumer goods. This paper discusses the changes and trends in the components of animal waste management. The discussion is divided into five areas: waste generation, waste transportation, waste processing, waste utilization and waste disposal. (Christenbury-Iowa State)

AEROBIC DIGESTION OF SWINE WASTE,
Illinois Univ., Urbana. Dept. of Agricultural Engineering.
D. D. Jones, J. C. Converse, and D. L. Day.
Proceedings of CIGR (Commission Internationale du Genie Rural), p 204-211, 1969. 7 fig, 2 ref.

Descriptors: *Oxygenation, *Aeration, *Foaming, Biochemical oxygen demand, Farm wastes, Swine, Lagoon, Dissolved-oxygen, Aerobic treatment, Odor, Gases, Liquid wastes, Waste water treatment.
Identifiers: *Oxidation ditch, *Total solids, Loading rate, Defoaming agent, In-the-building treatment.

An oxidation ditch for in-the-building treatment of swine waste was evaluated. Odorless aerobic treatment could be obtained under the self-cleaning slatted floors of a confinement building by connecting the ends of the liquid-manure gutters and adding a rotor aerator. The results indicate that loading rates of 6 cu. ft. or less per hog are not suitable for in-the-building, oxidation-ditch treatment. Loading rates of 8 cu. ft. per hog were most satisfactory. Oil was used as a defoaming agent when required. No foaming was encountered at loading rates higher than 8.5 cu. ft. per hog provided sufficient oxygen was supplied. The mixed-liquor, 5-day BOD of swine waste was reduced from 40,000 to 3,000 to 10,000 milligrams per liter. (Christenbury-Iowa State)
W71-03570

REUSE OF WASH WATER FOR CLEANING CAGED LAYER HOUSES,
North Dakota State Univ., Fargo. Dept. of Agricultural Engineering.
R. L. Witz, G. L. Pratt, and J. L. Sell.
Transactions of the ASAE, Vol 12, No 6, p 807-812, November 1969. 7 fig.

Descriptors: *Recirculated water, Farm wastes, Poultry, Storage tanks, Equipment, Odor.
Identifiers: Flushing gutters, Manure.

A liquid manure handling system was designed for a poultry house. Manure is collected in concrete gutters beneath the cages. A flushing process is used to clean the gutters. A wooden scrape is forced down the length of the gutter by pressure exerted by water that had been added behind the

scrape. The water was collected in an outside pit for reuse. This system has been effective for reducing the total quantity of water required for cleaning the poultry house. (Christenbury-Iowa State)

AEROBIC DIGESTION OF CATTLE WASTE,
Illinois Univ., Urbana. Dept. of Agricultural Engineering.
D. D. Jones, B. A. Jones, Jr., and D. L. Day.
Transactions of the American Society of Agricultural Engineers, Vol 11, 1968, p 757-761. 18 fig, 2 tab, 4 ref.

Descriptors: *Farm wastes, *Cattle, *Biochemical oxygen demand, Chemical oxygen demand, Aerobic treatment, Sludge, Aeration, Digestion, Regression analysis, Waste treatment.
Identifiers: *Loading rates, *Aerobic digestion, Dairy cattle, Beef cattle, Volatile solids, Fixed solids, Digesters.

The effectiveness was studied of the aerobic digestion process in the treatment of dairy and beef-cattle wastes. Waste from livestock being fed a high-concentrate ration was added in varying loading rates to laboratory aerobic digesters. This experiment indicates that, in the future, less emphasis should be placed on COD, VS, and FS and more on the measurement of BOD, which is a better indication of microorganism activity. BOD reductions of 70,60, and 76 percent and total VS reductions of 20,15, and 0 percent, respectively were obtained for loading rates of 125, 150, and 200 ml. from dairy cattle. Similar results were obtained using beef cattle waste. Under conditions similar to those prevailing in this study, significant reductions in biodegradable organic concentrations can be obtained. (White-Iowa State)
W71-03576

HOG WASTE DISPOSAL BY LAGOONING,
Illinois Dept. of Public Health, Springfield, Ill. Div. of Sanitary Engineering.
Charles E. Clark.
Journal of the Sanitary Engineering Division, Proceedings of the American Society of Civil Engineers, Vol 91, No SA6, p 27-41, December 1965. 5 tab, 1 fig, 9 ref.

Descriptors: *Farm wastes, *Farm lagoons, Odor, Scum, Gases, Bubbles, Biochemical oxygen demand, Chemical oxygen demand, Coliforms, Sampling, Depth, Volume, Septic tanks, Dissolved oxygen, Costs, Nutrients, Chlorophyta, E. coli, Antibiotics, Nitrogen, Potassium, Phosphorus, *Hogs.
Identifiers: *Lagoon supernatant, Shock loading, Surface area, Farrowing house, Feeding house, Total solids, Volatile solids, Enterococcus, Penicillin, Algal population.

The material presented consists of on-site observations and test results obtained from samples collected from an operational farm lagoon in Illinois. The program centered on this lagoon since others around it had failed. The system itself is described and possible solutions given as to why it does work. Chemical properties of the lagoon supernatant and the raw waste are compared. On the basis of observations made during this program, the most likely problem will be process failure caused by antibiotic effect, temperature change or shock loading. Studies are underway concerning the harvesting and feeding of algae from the lagoon. Operational problems as well as costs are evaluated for the total system. Finally, a practical system is suggested for the disposal of hog wastes. (White-Iowa State)
W71-03578

POULTRY MANURE DISPOSAL - IS THERE A PROBLEM,
C. T. Riley.
Agriculture, Vol 73, 1966, p 110-112.

Descriptors: *Poultry, Costs, Nutrients, Farm wastes, Fertilizers, Value, Waste disposal.
Identifiers: Muck, Handling, Removal.

The cost is examined associated with removal of poultry manure from the house to the disposal point. It is costing the poultry farmer a shilling per bird per year to remove the muck. The fertilizer value of poultry manure should not be overlooked. Farmers dispose enough manure that would be worth 160 units of nitrogen, 160 units of phosphorus and 70 units of potash if applied to a crop. (Christenbury-Iowa State)
W71-03579

EFFLUENT DISPOSAL - STILL A MAJOR PROBLEM,
Wright Raine Ltd.
W. T. A. Rundle.
Journal and Proceedings of the Institution of Agricultural Engineers, Vol 21, p 134-139, 1965. 5 fig, 5 tab.

Descriptors: *Farm wastes, *Slurries, Sludge, Sprinkler irrigation, Pumping, Storage tanks, Labor, Volume, Rates of application.
Identifiers: *Field spreading, Vacuum tanks, Mechanical agitation.

Equipment and methods of manure disposal used in handling manure slurries are described. The equipment is broadly divided into two categories including mobile trailer type equipment and pumping equipment. Several examples of each are given. Tables list the waste production and labor required for each system as a function of volume handled. A digester is also described, which reduces the volume of material put in by 20%, and produces a sludge with no smell. It is suggested that the cost of this operation would be prohibitive. A discussion follows centering on problems and solutions to problems which have arisen from the systems discussed. (White-Iowa State)
W71-03581

THE EFFECTS OF VOLUME AND SURFACE AREA ON THE RATE OF ACCUMULATION OF SOLIDS IN INDOOR MANURE DIGESTION TANKS,
Nebraska Univ., Lincoln.
Ali A. Al-Timimi, W. J. Owings, and John L. Adams.
Poultry Science, Vol 44, p 112-115, 1965. 3 tab, 4 ref.

Descriptors: *Farm wastes, *Poultry, *Digestion tanks, Volume, Least squares method, Overflow, Lagoons, Waste treatment.
Identifiers: *Surface area, Dry matter, Hen weight, Feed consumption, Egg weight.

Ten stainless steel tanks were utilized to form four volume and two surface area allowances. Leghorn type pullets were placed in eight inch cages over the tanks and their manure was allowed to accumulate in liquid for 20 weeks. At the end of each 2 week period, dry matter determinations were made and hen weight, feed weight and egg production were recorded. The dry matter percentages were put on a 3.5 cu. ft/bird basis and the changes in per cent dry matter from one period to another were calculated. Cubage and surface area per bird seemed to have no significant effects on the rate of digestion of the solids in the tanks. Periods and the interaction between treatments and periods were highly significant. Although the manure output is influenced by factors such as hen weight, feed consumption and egg weight, none of these factors showed any significant effect, because of the uniform distribution of the hens assigned to the treatments. Liquid overflow was inversely related to the surface area per bird. At least 3.5 cu. ft of water per bird is needed to provide for biennial cleaning. (White-Iowa State)

A NOTE ON THE UTILISATION BY CHICKENS OF ENERGY FROM FAECES,
Queensland Univ., Brisbane (Australia). Dept. of Animal Husbandry.
W. J. Pryor, and J. K. Connor.
Poultry Science, Vol 43, p 833-834, 1964. 2 tab, 2 ref.

Descriptors: *Farm wastes, *Poultry, Energy, Wheat, Sorghum, Nitrogen.
Identifiers: *Metabolizable energy, Bomb calorimeter, Ration.

Four groups of male chickens aged 22 days which had been on a trial to determine the metabolizable energy of grain sorghum, were allotted at random two to each treatment. Two groups were fed crushed grain sorghum. The remaining two groups were fed a ration consisting of 80% crushed grain sorghum mixed with 20% feces resulting from a previous wheat trial. All four rations contained a standard broiler mineral and vitamin supplement. The results showed that the feces had a metabolizable energy value of approximately 30% of the feed from which it originated. (White-Iowa State)

THE MANAGEMENT OF LIVESTOCK MANURE,
California Univ., Davis. Dept. of Agricultural Engineering.
S. A. Hart.
Transactions of the ASAE, Vol 3, p 78-80, 1960. 4 fig, 1 tab, 13 ref.

Descriptors: *Farm wastes, *Disposal, *Management, Storage, California, Dehydration, Livestock, Fertilizers, Value.
Identifiers: *Composting, *Sanitation, Processing, House fly, Musca domestica, Carbon to nitrogen ratio, Production.

Manure management will seldom be a profit-making part of the farming enterprise. In most cases the cost of proper handling will exceed the value of the manure as a fertilizer or soil amendment. Even so, manure handling is as necessary a chore as is feeding or animal care. Through proper manure management the net cost of handling the manure can be minimized and the sanitation requirements of the farming operation fulfilled. The procedures of systems engineering are applicable to the management of livestock manure, and can be stated as the specific operations of: (a) gathering and cleaning up the manure, (b) storing or processing it, and (c) utilizing or disposal of it. (Christenbury-Iowa State)

SWINE WASTE MANAGEMENT-ANAEROBIC LAGOONS,
Illinois Univ., Urbana. Dept. of Agricultural Engineering.
Arthur J. Muehling.
Cooperative Extension Service, University of Illinois at Urbana-Champaign, August 1969. 2 p. AENG-877.

Descriptors: *Hogs, *Farm wastes, *Anaerobic conditions, *Lagoons, Size, Sites, Construction, Shape, Depth, Odors, Sludge, Water pollution, Temperature, Intakes, Outlets, Grading, Management, Mixing, Organic matter, Stabilization.
Identifiers: *Loading rates, *Location, Solids, Wind action, Gas bubbling, Volatile solids.

Anaerobic lagoons were first adapted for the storage and treatment of hog wastes because of their low initial cost, ease of operation, and lack of serious alternatives. They have not always been successful, for sometimes they release objectional odors, they can pollute surface and underground water, they sometimes do not decompose the manure adequately, and in time they are apt to fill up with sludge. This fact sheet gives advice as to loading rates, size and location of anaerobic lagoons. Attention is given to the construction shape, depth, inlets and outlets, fencing, and grading of banks. Management practices include an adequate supply of water, correct start-up, continuous loading rates, restriction of solids, and adequate mixing. (White-Iowa State)

FINEMENT SWINE HOUSING - SLOTTED ORS,
is Univ., Urbana. Dept. of Agricultural En-ring.
ur J. Muehling.
perative Extension Service, University of Il-s at Urbana-Champaign, August 1969. 2 p. g-875.

riptors: *Construction materials, *Reinforced rete, *Metals, Farm wastes, Dimensions, Cor-n, Failure, Durability, Depth, Height, Length, forcement, Hog.
ifiers: *Slotted floors, *Wood, *Spacing, Ex-ed metal, Farrowing, Feed wastage.

fact sheet lists wood, concrete and metal as effective for slotted floors. Advantages and vantages of each type are given, as well as nsions that should be used. Expanded metal and steel straps are both discussed as to their effectiveness for slotted floors. The amount and kind of reinforcing to use in concrete slats is given. Recommended spacing and advice for farrowing on slotted floors is also given. Pens with totally slotted floors remain consistently cleaner than those partially slotted. In general, the larger the pig the wider the slat that can be used without sacrificing cleaning efficiency. (White-Iowa State)

CONFINEMENT SWINE HOUSING - SPACE REQUIREMENTS,
Illinois Univ., Urbana. Dept. of Agricultural Engineering.
Arthur J. Muehling.
Cooperative Extension Service, University of Illinois at Urbana-Champaign, August 1969. 2 p. AEng-874.

Descriptors: *Size, *Seasonal, *Temperature, *Ventilation, Farm wastes, Hogs, Confinement pens, Management, Performance, Economics.
Identifiers: *Space requirements, Method of feeding, Number of pigs per pen, Heat stress.

As confinement housing has changed to include total enclosure of feeding and sleeping area under roof, the minimum space requirements recommended for pigs in confinement have been reduced. These recommendations indicate the minimum amount of floor space per pig necessary to prevent a significant reduction in pig performance and to maintain a reasonable degree of cleanliness in the pen. The fact sheet lists space requirements for different weight ranges of hogs. These recommendations are based on research that has considered the more important factors affecting space needs. The factors discussed in the fact sheet include size of animal, season (as related to temperature), ventilation, method of feeding, level of management, and number of pigs per pen. (White-Iowa State)

A GROWING MARKET FOR WATER AND WASTEWATER TREATMENT EQUIPMENT,
Business and Defense Services Administration, Washington, D.C. Water Resources and Engineering Services Div.
K. I. Kollar, and William G. Youngwirth.
Water and Sewage Works, Vol 117, No 9, September 1970, p 319-325. 7 tab, 2 charts.

Descriptors: *Cost comparisons, *Cost analysis, *Surveys, *Costs, Construction costs, Evaluation, Economics, Equipment, Prices, Water treatment, Waste water treatment.
Identifiers: *Cost data, *Cost surveys, Market research.

This paper presents data obtained from questionnaire response of water and waste water treatment equipment manufacturers. The questions related to the manufacturing plant capacity, and the values of shipments of various kinds of water and waste water treatment equipment. The results of surveys conducted in 1965 and 1968 are reported. Tabulated data include: a summary of total expenditures and values of shipments of major equipment items; the sizes of manufacturing establishments based on the value of shipments; the value of all shipments of specific equipment items broken down into water treatment and waste treatment categories; values of total shipments and production capacities for plants manufacturing water and waste water treatment equipment; a comparison of the gross national product, total municipal water and waste water expenditures, and federal grants. In additon, charts showing municipal expenditures for water supply and waste water disposal from 1960 to 1980 (est.) are given. The collected data indicate that water and waste water treatment equipment account for 4.2% of total municipal expenditures, and 15.9% of total municipal treatment facilities expenditures. Approximately 11.2% of industrial construction costs are for water and waste water treatment equipment. (Hewett-Rutgers)

INDIVIDUAL WASTE DISPOSAL SYSTEMS,
Connecticut Univ., Storrs.
W. C. Wheeler, J. J. Kolega, R. P. Prince, and G. W. Hawkins.
Research Project Technical Completion Report, June 30, 1970. 8 p, 3 ref. OWRR Project A-001-CONN-4.

Descriptors: *Septic tanks, Waste water treatment, *Waste water disposal, *Aeration, *Temperature, Effluents, Spectrophotometry, Biological treatment, Pumping, Chemical oxygen demand, Hydrogen ion concentration.
Identifiers: Aspirators, Air diffuser, Synthetic effluent, Differential pumping.

Solutions containing trypticase soy as the primary degradable contaminant were found to give reproduceable results when used as the influent for studies using model septic tanks. When spectrophotometer readings for light emissivity of refluxed samples were applied to curves established for the media being used, the readings obtained were dependable COD indications. The efficiency of biological treatment processes in model septic tanks of the same volume was best for the tanks having the greatest surface areas. A sudden expansion type of aspirator was developed for adding air to liquid. It was more efficient than several other devices tested. The aspirator was used with a two-compartment aeration tank and a differential pumping scheme to produce effluent of excellent quality.

EVALUATION OF PYRRONES AS MEMBRANES,
Franklin Inst. Research Labs., Philadelphia, Pa.
H. Scott, and F. L. Serafin.
NASA CONTRACTOR REPORT NASA CR-1648, September 1970. 35 p, 8 tab, 15 fig, 10 ref. Contract NAS 1-8609.

Descriptors: *Membranes, Desalination, Urine, Water purification, *Reverse osmosis, *Osmosis, Waste water treatment.
Identifiers: Polymidazopyrrolones, *Pyrrones.

The facile absorption of water by polyimidazopyrrolones (Pyrrones) suggested a feasibility study to use films of the polymers as membranes for the purification of water by reverse osmosis. This report describes direct osmosis measurements of water, salt, and urea fluxes through Pyrrone membranes. The data indicate comparable flux values and superior water-to-salt permeabilities of the Pyrrones relative to symmetric cellulose acetate membranes. Coupled with better mechanical strength and chemical resistance, these results suggest that the successful fabrication of asymmetric Pyrrone membranes could lead to substantial improvements over asymmetric cellulose acetate, from which the best reverse osmosis membranes are currently prepared.

DESIGN OF PLUG-FLOW POST-AERATION BASINS,
Rex Chainbelt, Inc., Milwaukee, Wis. Process Equipment Div.
Richard A. Kormanik.
Journal Water Pollution Control Federation, Vol 42, No 11, November 1970, p 1922-1931. 5 fig, 2 ref.

Descriptors: *Aeration, Design, *Oxygenation, Sewage treatment, Waste water treatment, Dis-

solved oxygen, Effluents, Sewage effluents, Storage.
Identifiers: Post-Aeration Basins, Dissolved Gases, *Air-Diffusers, Detention time.

Regulatory agencies have begun to set requirements stipulating minimum allowable dissolved oxygen levels. Since most treatment process produce effluent meeting the required dissolved oxygen levels, post-aeration is required. This paper presents the development of design procedure for describing mathematically a plug flow post-aeration system utilizing diffused aeration. The developed design equations, as is the case for the completely mixed system, indicate that when the waste effluent flow is considered to have an oxygen utilization rate equal to zero, the post-aeration basin detention time does not become a design parameter of the system, and with an oxygen utilization rate taken under consideration, the number of air diffuser units required becomes proportional to the detention time. THE KINETICS OF ANAEROBIC LONG CHAIN FATTY ACID DEGRADATION,
Missouri Univ., Columbia. Dept. of Civil Engineering.
John T. Novak, and Dale A. Carlson.
Journal of the Water Pollution Control Federation, Vol 42, No 11, Nov 1970, p 1932-1943. 12 fig, 1 tab, 26 ref.

Descriptors: *Anaerobic digestion, Acids, Degradation, Waste water treatment, Metabolism, Oxidation, Kinetics, Sludge, Effluents, *Sludge digestion, Digestion, Storage, Liquid wastes.
Identifiers: *Fatty acids, Detention time.

Greases normally account for about 30% of the volatile matter in raw waste water sludge. The purpose of this study was to determine the rate at which fine selected long chain fatty acids could be degraded in an anaerobic system under optimum conditions. These fine fatty acids, which comprise about 90% of the fatty acids commonly found in waste water sludge, were each fed continuously to completely mixed laboratory anaerobic digestion units along with the necessary inorganic nutrients. Data were analyzed using a kinetic model based on the Monod equation which relates the biological solids retention time (SRT) to the effluent substrate concentrations. The degradation rates of the fine fatty acids fell into two groups: (1) the unsaturated acids were degraded most rapidly, undergoing greater than 90% removal at a detention time of 10 days and (2) rates of degradation of the saturated 14-, 16- and 18-carbon fatty acids were much slower and a decreasing rate was observed to occur with increasing chain length. INDUSTRIAL WASTE TREATMENT-FACT AND FICTION,
Atlantic Richfield Co., Philadelphia, Pa. Air and Water Conservation.
William B. Halladay.
Journal Water Pollution Control Federation, Vol 42, No 11, November 1970, p 2004-2008.

Descriptors: *Waste water treatment, *Industrial wastes, Legislation, Water Quality Act, Water quality.

Because there are many misconceptions about the efforts of industry to control water pollution, this paper attempts to distinguish some of the things that may be considered real or fictitious in the progress and development of industrial waste treatment today. Industry participated in hearings held to establish water quality standards under the Water Quality Act of 1965, and industry became aware of the necessity of pollution control programs. These programs are advancing but are hampered by lack of financing and the need for new technological breakthroughs. Some of the fictions the author refutes are that industry creates most pollution, that the nation is running out of water, that industry has all necessary techniques to clean up water, and that different types of pollution can be attacked piecemeal. Strong and weak points of the legislation is discussed. (Selby-Texas)

DEVELOPING A REGIONAL WASTE WATER SYSTEM,
Brazos River Authority, Waco, Tex.
Ross L. Jacobs, and Carson H. Hoge.
Journal Water Pollution Control Federation, Vol 42, No 11, November 1970, p 1951-1961. 1 tab.

Descriptors: Waste water disposal, Legislation, Texas, Industrial wastes, *Sewage districts, *Regions, Municipal wastes.
Identifiers: Revenue, Urban areas, Systems management.

Problems connected with providing for the proper collection and treatment of liquid wastes in metropolitan areas may often best be dealt with by providing a regional sewage system to serve several or all of its separate municipalities. This paper presents a history of regional systems in Texas. Problems that prompted the development of systems and the steps taken provide an overview of typical factors involved in such an effort. Engineering, legal, financial problems, industrial wastes, waste water concentration and components, bonding, and communications are the considerations discussed as they relate to Texas metropolitan areas. The report concludes that the Texas Water Quality Board and the FWQA have long recognized the advantages of a regional sewage system in urban metropolitan areas as a means of reducing pollution of the rivers and streams of the state, and that they have given a great deal of support to such systems that have been developed. RAW SLUDGE PUMPING PROBLEMS AND INTERDISCIPLINARY SOLUTIONS,
Boston Metropolitan District Commission, Mass. Deer Island Sewage Treatment Plant.
Andrew P. Fisichelli.
Journal Water Pollution Control Federation, Vol 42, No 11, November 1970, p 1916-1921.

Descriptors: Sludge treatment, Maintenance, Sludge, Waste water treatment, Pumping, Massachusetts, Screens.
Identifiers: *Raw sludge, *Sludge pumping, Check valves, Grease buildup, Boston (Mass).

The operating problems of line plugging and check valve obstruction in raw sludge handling and transporting are reported. The research of this study pertains to the Deer Island Plant, Metropolitan District Commission, Boston, Massachusetts. The problems were minimized by improving the effectiveness of the screening operation and eliminatin or minimizing grease and oil buildup. Screenin problems were reduced by eliminating the use grinders and not returning screenings to the flo and the use of differential head pressure (up stream-downstream of the screen) as the primar control for the cleaning mechanism. A creosote base fuel oil solvent used once per week controlle grease accumulation. These problems are commo to all sizes of waste treatment facilities in varyin degrees. (Selby-Texas)

COSTS AND MANPOWER FOR MUNICIPA WASTE WATER TREATMENT PLANT OPERA TION AND MAINTENANCE, 1965-1968,
Federal Water Quality Administration, Washin ton, D.C.
Robert L. Michel.
Journal Water Pollution Control Federation, V 42, No 11, November 1970, p 1883-1910. 20 fi 31 tab, 9 ref.

Descriptors: *Waste water treatment, Economic *Municipal wastes, Variable costs, Unit cost Electric power, Operating costs, Maintenanc Sewage treatment, *Personnel, *Costs.
Identifiers: Municipal waste water treatment.

Between 1965 and 1968, data was taken fro 1,600 plants during a study of labor, electrical, an chemical costs of waste water treatment operatio and maintenance. Unit costs (dollars or man-hou expended per unit load) declined exponentiall with increased plant size, thereby showin economics of scale. Labor and supervision a counted for 50 to 60% of operation and mai tenance expenditures, with electric power rankin next in importance, particularly in activated sludg plants. Chlorination operating expenses were abo 3% of total operating costs. Oxidation lagoons we shown to be an inexpensive form of treatment t operate. Use or non-use of sludge processing equi ment is the most critical factor in operation an maintenance costs. Vacuum filters are especiall expensive to operate. (Selby-Texas)

A DISCUSSION OF 'CONCEPTIONS AN MISCONCEPTIONS IN BIOLOGICAL OXIDA TION,'
Clemson Univ., S.C.
John F. Andrews.

n: Advances in Water Quality Improvement, Jniversity of Texas Press, Austin, Texas and Lon-on, England, 1968, p 176-177. 1 tab, 3 ref.

escriptors: *Biological treatment, *Oxidation, rickling filters, Activated sludge, Methane, Bac-ria, Waste water treatment.
lentifiers: *Biological oxidation.

he author refers to the article 'Conceptions and isconceptions in Biological Oxidation' by A. W. usch. (See W70-04773). The author says Busch as calculated using a 1 micron film thickness and heres 3 inches in diameter that a trickling filter ould contain less than 1 mg of solids/l of filter olume. When this is compared to the 2000-4000 g/l of solids commonly found in the conventional tivated sludge aeration tank it would appear that e trickling filter process is more inefficient (per nit volume) than the activated sludge process by veral orders of magnitude. Even if the film ickness were 100 microns, the activated sludge ration tank would still contain a much larger uantity of solids per unit volume than the trickling ter. The actual picture is not as black as that inted by Prof. Busch. If one compares the 2 ocesses, as currently used, it will be found that ere is not a great deal of difference in the volu-etric loading rates of the 2 processes. This is tabu-ed. Advances in solid-liquid separation devices d gas transfer devices will undoubtedly increase e allowable volumetric loading rates for the ac-ated sludge process. Advances such as the con-olled filtration process of Ingram's should also in-ease the allowable volumetric loading rates for the ckling filter process. Busch has also hypothesized at methane production may be a result of the ef-ct of environment on the more common bacteria; d, therefore, the methane bacteria may not exist separate species. He offers no evidence. P. H. ith has recently conducted experiments, using re cultures, which appear to disprove Prof. sch's hypothesis. (See also W70-04761) (Selby-xas)

A DISCUSSION OF 'ANAEROBIC TREATMENT OF SOLUBLE WASTES,'
Clemson Univ., S.C.
John F. Andrews.
In: Advances in Water Quality Improvement, University of Texas Press, Austin, Texas and London, England, 1968, p 353-354. 5 ref.

Descriptors: *Anaerobic conditions, *Trickling filters, Biological treatment, Oxidation, Solubility, Wastes, Waste water treatment.
Identifiers: *Anaerobic treatment, Filter media, Hydraulic upflow.

The author refers to 'Anaerobic Treatment of Soluble Wastes' by P. L. McCarty. (See W70-04783). McCarty has stated that his proposed process (Anaerobic trickling filter with hydraulic upflow) is limited to soluble wastes and has performed his experiments using the soluble substrates methanel, formic acid, acetic acid, and propionic acid. He has shown in these experiments that the process gives a high percentage of COD removal with a low solids concentration in the effluent. However, by using soluble substrates which are directly metabolized by the methane bacteria he has neglected solids produced in the conversion of such soluble wastes as sugars to volatile acids. Speece and McCarty have shown that this can be significant in that as much as 0.46 grams of solids can be produced per gram of glucose COD utilized. They also indicate that the major portion (0.406 gm) are produced in the conversion of glucose to volatile acids. The solids produced are destroyed at a relatively low rate and may result in the clogging of the filter media and/or pass over in the effluent from the reactor. The filter media used by McCarty may be unnecessary. A vertical multi-stage reactor, such as that proposed by Gates et. al., would make more efficient use of the reactor volume, reduce the danger of clogging and permit the digestion of both soluble and insoluble wastes. This upflow reactor consists of a mixed lower chamber in which anaerobic decomposition occurs, a solids separator just above the lower chamber which returns solids to the lower chamber, intermediate baffles to prevent oxygen from the aerobic compartment from reaching the anaerobic chamber and separator, and an upper chamber for odor control. PROBLEMS OF POLLUTION CONTROL,
Oklahoma State Univ., Stillwater. Engineering and Industrial Extension.
James H. Suddreth.
Proceedings available from Oklahoma State University, Engineering and Industrial Extension, Stillwater, Okla, Price: $5.00. Proceedings, 42nd Annual Water and Pollution Control School, Oklahoma State University, November 18-22, 1968, Stillwater (1969), p 1-6.

Descriptors: *Water pollution, *Water pollution control, *Pollution abatement, Waste water treatment, Operations and maintenance, Sewage treatment, Water quality control.

The primary purpose of ancient sewers was ground and surface drainage. The use of water for collection and transport of human wastes was not generally adopted until the nineteenth century. Eventually, sewage production and discharge to streams surpassed the ability of the stream to assimilate the waste and pollution resulted. Therefore, it became necessary for man to treat his waste water before discharging it to the receiving stream. The following steps are recommended for solving pollution control problems at the treatment plant level. Recognize the problem, gather the data, list possible solutions, test possible solutions, select final solution, implement solution, follow up action. The individual waste water treatment plant operator must make decisions daily. It is important that he have all the facts available, know the importance of time in the problem, understand the implication of action vs. inaction, and be able to implement his decision. Adequate knowledge of plant unit operations and preventive maintenance help the operator avoid embarassing problems. Three example problems and their solutions are discussed in an effort to illustrate problems that occur in waste water treatment plants. (See also W71-03820 thru W71-03829) (Makela-Texas)
W71-03819

OPERATION AND MAINTENANCE OF A PRIMARY CLARIFIER,
Shawnee Water and Sewer Dept., Okla.
Del Chancellor.
Proceedings of the 42nd Annual Water and Pollution Control School, Oklahoma State University, November 18-22, 1968, Stillwater (1969), p 7-13.

Descriptors: *Sewage treatment, *Operation and maintenance, *Settling basins, *Sedimentation, Settling velocity, Septic tank, Waste water treatment.
Identifiers: *Primary treatment, Imhoff tank, *Clarifiers.

This article gives a basic review of the purposes of a primary settling tank, the types of tanks commonly found, and the operation and maintenance of settling tanks. The purpose of a primary settling tank is to remove settleable solids by reducing the velocity of waste water flow. Four types of settling tanks in use are the septic tank, the Imhoff tank, the rectangular sedimentation basin, and the circular sedimentation basin. The Imhoff tank combines solids settling and digestion in one unit. Control of foaming in the Imhoff tank and routine operations are discussed. Expected removal rates are 40-60% for suspended solids and 25-35% for BOD. Inlet design, use of baffles, outlet weir design, surface settling rate, and detention time are discussed for rectangular and circular tanks. Circular tanks have greater structural strength and are more economic to build than rectangular tanks suspended solids removal rates of 90-95% and BOD reduction of 35-45% can be expected. Routine operations are discussed with emphasis on sludge removal and preventive maintenance. (Makela-Texas)
W71-03820

BUTTERFLY VALVES,
Dresser Research, Tulsa, Okla.
William C. Gilmore.
Proceedings of the 42nd Annual Water and Pollution Control School, Oklahoma State University, November 18-22, 1968, Stillwater, (1969), p 14-26.

Descriptors: *Butterfly valves, *Valves, Flow control, Operation and maintenance, Water distribution, Water treatment, Waste water treatment.
Identifiers: Butterfly valves.

Some advantages of the butterfly valve are simplicity of construction, low initial cost, bottle-tight shutoff, ease of operation, and a minimum of maintenance. Initial valve costs are low due to lack of need for expensive modifications to pipe layout. Butterfly valves weigh one third as much and occupy one half as much space as conventional gate valves. Installation is easier. The valve can be operated by one man. 100% bottle-tight shutoff at full rated pressure is obtainable. Corrosion is reduced by use of cast iron, 304 steel, rubber and Teflon for all wetted parts. Head loss is equivalent to a pipe elbow, but greater than losses in other type valves. (See also W71-03819) (Makela-Texas)
W71-03821

WATER FILTRATION,
Oklahoma State Univ., Stillwater.
A. Y. Hyndshaw.
Proceedings of the 42nd Annual Water and Pollution Control School, Oklahoma State University, November 18-22, 1968, Stillwater (1969), p 27-36.

Descriptors: *Filters, *Filtration, *Water treatment, Water purification, Activated carbon, Sands, Uniformity coefficient, Waste water treatment.

Identifiers: Filter media, Anthracite, Mixed media filtration.

A review of water treatment by filtration is presented. The early history of water filtration, and the discovery that pathogenic organisms were removed by filtration are discussed. Filters may be classified by force of movement, rate of filtration, filter material, or application. Rapid sand filters are the most popular and most common type filter in use. They are generally operated at 2-4 gallons per square foot per minute and are preceded by coagulation and sedimentation. General design criteria include 8-10 ft. overall basin depth, 12-15 inches underdrain, 9-18 inches support media, 24-30 inches filter media, 4-5 ft. water depth, and one foot of freeboard. Filter media effective size and uniformity coefficients are given for sand, anthracite, activated carbon, and mixed media. Rapid sand filters are usually gravity operated at 2-4 gpm/ft sq. Backwashing is necessary when head losses reach 8-9 ft. Bed expansion of 20-60%, (40% avg.) is desired. Backwash for 5-10 minutes is required every 12-40 hours for single media, and 25-85 hours for mixed media. Media effective size and depth are determined by head loss and floc penetration characteristics of the media. Mixed media filtration is the most important development since the introduction of rapid sand filtration. Mixed media filtration allows removal in depth, thereby acheiving greater filtration efficiency and filter runs 2 1/2 times longer than single media. For most efficient operation, mixed media must expand at the same rate during backwashing. Bacteria and grease coatings on activated carbon decreased efficiency and may require carbon regeneration. (See also W71-03819) (Makela-Texas)
W71-03822

NEW DEVELOPMENTS IN AUTOMATIC CATHODIC PROTECTION FOR WATER STORAGE TANKS,
Oklahoma State Univ., Stillwater.
Ed Morris.
Proceedings of the 42nd Annual Water and Pollution Control School, Oklahoma State University, November 18-22, 1968, Stillwater (1969), p 37-44.

Descriptors: *Cathodic protection, *Automatic control, Corrosion, *Corrosion control, Electrodes, Potentiometers, Waste water treatment, *Storage tanks, Storage.
Identifiers: Potentiostat polarization control.

The development of potentiostat polarization control is the latest development in automatic cathodic protection for water storage tanks. The rate of corrosion activity within a structure varies with many factors including water resistivity changes, water corrosivity changes, accumulated ampere hour effect, loss of coating effectiveness, anode consumption, and water level fluctuation. Automatic corrosion control devices require consideration of all these variables. Early corrosion control devices depended on a constant corrosion activity for maximum effectiveness and consisted of a rectifier and anode system. The automatic potential control developed in the early 1960's consisted of a reference electrode continuously monitoring the structure potential and regulation circuit which controlled D.C. output from the anode system. A limitation of this method of corrosion control was the fact that only one reference electrode was used and it measured the potential on only a small area of the structure. Also a copper/copper sulfate reference electrode could not be used because of inability to maintain a saturated copper sulfate solution when in water service. To overcome these limitations the potentiostatic polarization control was developed. It features the use of a copper/copper sulfate electrode, which maintains the desired potential of -0.85 volts. The new system offers three separate control circuits for the application, regulation, and measurement of cathodic protection. The most dramatic improvement is the bridge circuit potentiostat polarization control similar to a wheatstone bridge electrical circuit. This circuit allows the measurement of structure potentials free of IR drops in the water and coating. The use of several reference electrodes, each of which is capable of monitoring large areas, allows the monitoring of the complete structure. (See also W71-03819) (Makela-Texas)

SLUDGE HANDLING AND DISPOSAL,
Tennessee Dept. of Health.
H. B. Rosson.
Proceedings of the 42nd Annual Water and Pollution Control School, Oklahoma State University, November 18-22, 1968, Stillwater (1969), p 45-52. 2 ref.

Descriptors: *Sludge, *Sludge treatment, *Sludge disposal, Sludge digestion, Fertilizers, Waste water treatment, Waste disposal.
Identifiers: Sludge handling, Composting.

Sewage sludge is the accumulated settled solids removed from sewage by sedimentation. Descriptive of source, it may be termed primary, secondary, excess activated, or chemical. Descriptive of treatment received, it may be termed raw, digested, elutriated, dewatered, or dried. The solids content of sludges vary from 0.5% to 15% depending on the treatment received. Economic values in sludge include its potential use as animal feed, fertilizer, high calorific fuel (7,700 BTU/pound raw solids), and production of useful combustible gases when anaerobically digested 770BTU/cubic foot of gas). The primary purposes of sludge treatment are reduction of sludge volume and destruction of its putrescibility. Unit operations useful are thickening, chemical conditioning, elutriation, biological flotation, vacuum filtration, air drying, heat drying, digestion, incineration, or a combination of the above. Final disposal methods used include landfill, incineration and landfill, ocean disposal, lagooning, use as fertilizer and composting. A Johnson City, Tennessee plant, now composts the city's refuse and sludge together producing 25 tons/day of mixed compost. Sludge is used at the rate of 12% by weight for best results. CHLORINATION OF WASTE WATER,
Tennessee Dept. of Health.
H. B. Rosson.
Proceedings of the 42nd Annual Water and Pollution Control School, Oklahoma State University, November 18-22, 1968, Stillwater (1969), p 53-60. 6 ref.

Descriptors: *Chlorination, *Waste water treatment, *Sewage treatment, Disinfection, Odor, Corrosion control, Effluents, Public health, Environmental sanitation, Diseases.
Identifiers: *Chlorine demand.

The Water Quality Act of 1965 requires chlorination of all waste water effluents which exceed maximum allowable limits for coliform. The most important function of chlorination of waste water is disinfection and ultimate destruction of pathogenic bacteria, virus, and amoeba. Other benefits of chlorination are odor control, BOD reduction, corrosion control, grease removal and control, control of psychoda files and trickling filters, control of trickling filter ponding, control of activated sludge bulking, thickening of waste activated sludge, and prevention and removal of bacterial slime growths. Odor control is effected by reaction of chlorine with H_2S to precipitate sulfer. However, less chlorine is required to kill the H_2S producing organisms. Therefore, prevention of odors are more economical than remedial action. BOD reduction in the range of 15% to 35%, with an average of 20% to 25%, can be expected with 0.2-0.5 ppm orthotolidine residual after 10 minute contact. Corrosion control is also effected by elimination of H_2S before it reacts to form sulfuric acid. Grease removal is obtained by prechlorination at 2-5 ppm. Psychoda flies can be killed by weekly applications of 3-10 ppm chlorine. (See also W71-03819) (Makela-Texas)
W71-03825

LABORATORY TECHNIQUES FOR DISSOLVED AND SUSPENDED SOLIDS: TOTAL, VOLATILE, AND FIXED,
Oklahoma State Univ., Stillwater.
Patricia J. Turner.
Proceedings of the 42nd Annual Water and Pollution Control School, Oklahoma State University, November 18-22, 1968, Stillwater (1969), p 61-70. 4 ref, 3 tab.

Descriptors: *Analytical techniques, *Dissolved solids, Laboratory tests, Waste water treatment, Solid wastes.
Identifiers: *Suspended solids.

The purpose of laboratory work is to collect data which can be practically applied to a water pollution control program. Accuracy and neatness in technique are most important. Consistency in sample is also much desired. The author recommends a properly refrigerated 24 hour composite sample for use in dissolved and suspended solids determination. The author also gives a step by step outline of the procedure to follow in determining total, volatile, and fixed dissolved and suspended solids. A commentary on important points accompanies this procedure. Both dissolved and suspended solids tests are based on a loss in weight due to precise temperature drying. An accurate weight must be determined by a consistent method, and a constant weight must be reached at every drying point. With practice, this technique can be used by any waste water treatment plant operation to check the efficiency of operation of each treatment unit in the plant. (See also W71-03819) (Makela-Texas)

WATER WORKS RECORD KEEPING,
Oklahoma State Univ., Stillwater.
B. J. Bourlon.
Proceedings of the 42nd Annual Water and Pollution Control School, Oklahoma State University, November 18-22, 1968, Stillwater (1969), p 71-81.

Descriptors: *Costs, Operation and maintenance, Budgeting, Cost allocation, Cost analysis, Personnel management, Waste water treatment.

This article briefly states the reasons for keeping records in a municipal Water and Waste Water Treatment Department. Records serve as a data source for analysis, planning, and control. Records can be kept in three main areas; progress, planning, and budget support. Records should be simple, clear, concise, and should contain all necessary and pertinent data. Unused records are a waste of time and money. Records can be kept in many activities including the following which are discussed in some detail: activity expenditure control which covers cost controls in personnel services, maintenance and operation, contractual services, and capital outlays; time studies which yield comparison records of times for use in judging the efficiency of operation of employees and procedures; personnel records, both background and on-the-job; research and development; job analysis and work orders which enable the determination of efficiency of man-hours and materials; maintenance records, production records; laboratory analysis records of water quality tests, etc. One of the most important uses of records lies in the area of budget preparation. OPERATION AND MAINTENANCE OF A PRIMARY CLARIFIER,
Oklahoma State Univ., Stillwater.
B. J. Bourlon.
Proceedings of the 42nd Annual Water and Pollution Control School, Oklahoma State University, November 18-22, 1968, Stillwater (1969), p 82-9

Descriptors: *Sewage treatment, Operation and maintenance, *Settling basins, Sedimentation, Settling velocity, Waste water treatment.
Identifiers: *Primary treatment, *Clarifiers.

e purpose of primary treatment is to remove set-able solids from sewage and to prepare the solids disposal. A plain settling basin involves only ids settling and collection. Solids treatment oc-rs elsewhere. A multipurpose basin involves both tling and sludge treatment. Multipurpose basins e usually designated as septic tanks, or in one odification, as an Imhoff tank. This article cusses briefly several features of importance to mary clarification. Subjects discussed include: tors affecting sedimentation, short circuiting, et and outlet structures, features of plain primary rifiers, efficiency of plain primary clarifiers, dge withdrawal, maintenance of primary rifiers, performance expected, and record keep-. For example, a plain settling tank, under nor-l operation on raw domestic sewage, should nove 90 to 95% of the settleable solids, 40 to % of suspended solids and 30 to 40% of the OD; and it should concentrate the sludge to a isture content of 93 to 96%. ABILIZATION POND OPERATION AND AINTENANCE,
lahoma State Univ., Stillwater.
ne L. Mansur.
ceedings of the 42nd Annual Water and Pollu-n Control School, Oklahoma State University, vember 18-22, 1968, Stillwater (1969), p 93-2. 7 ref.

scriptors: *Oxidation lagoons, Operation and intenance, *Lagoons, *Sewage lagoons, Sewage atment, Waste water treatment.

ste stabilization ponds provide a high degree of atment with a minimum of maintenance and erational expense, yet, because these ponds can erate with surprisingly little attention, main-ance and operational requirements are often glected. The purpose of this paper is to present ne guides to operations and maintenance of ste stabilization ponds. The author first defines a ste stabilization pond and its potential classifica-n as aerobic, anaerobic, or facultative. The func-ns of aerobic, anaerobic, and facultative bacteria l algae are discussed with respect to waste sta-zation ponds. Assuming proper pond design, the erator's goal is to provide favorable conditions algae and bacterial growth. At start up, it is pful to add commercial fertilizer at a rate of 200 per acre. The design water depth should be intained to allow the most efficient relationship ween time-detention capabilities and algae-sun-t-oxygen capabilities. Special releases should be de during periods of heavy rainfall or high water w. Weeds and floating scum should be removed ekly. An operation schedule and seasonal check for assistance in operation and maintenance of lagoon is given, and the use of several ponds in allel, or in series, or in combination is discussed h the viewpoint of maximum efficiency at vari-times of operation. BSURFACE DISPOSAL OF LIQUID WASTES ONTARIO,
D. McLean.
tario (Canada) Department of Energy and ources Paper 68-2, December 1968. 91 p, 23 2 tab, 95 ref, 2 append.

Descriptors: *Waste disposal, *Injection wells, Industrial wastes, Waste water disposal, Hydrogeology, Aquifers, Confined water, Aquicludes, Geology, Permeability, Water chemistry, Water quality.
Identifiers: *Canada, *Waste disposal wells, *Ontario (Canada).

Ontario, as a site for subsurface disposal of wastes, is discussed in relation to its pecific geological and hydrological features, with regard to their suitability for disposal, and the policies and requirements of its regulatory agencies. The proposed disposal formation must be a uniform sandstone, limestone or dolomite aquifer, large in area and cross-section, with high porosities and permeabilities. The formation must be well below fresh water horizons and be contained by overlying and underlying impermeable strata. A salt water filled formation, artesian in nature, and containing no waters of economic value should be employed. The fluids present must be compatible with the ones to be injected. The region surrounding a proposed disposal well must be studied to ascertain whether there are any unplugged wells which penetrate the formation, or whether there is evidence of fractures or faults. Equations were developed for ideal conditions which permit accurate predictions of well performance, dispersion of waste and pressure buildup. The well must be constructed in such a manner as to protect all other horizons and to confine the waste to the disposal formation. It is essential that any disposal operation be monitored. ULTIMATE DISPOSAL OF ADVANCED-TREATMENT WASTE, PART 1. INJECTION, PART 2. PLACEMENT IN UNDERGROUND CAVITIES, PART 3. SPREADING,
Louis Koenig-Research, San Antonio, Tex.
L. Koenig.
Available from NTIS as PB-168 796, $3.00 in paper copy, $0.95 in microfiche. Environmental Health Series AWTR-8, Advanced Waste Treatment Research Program, US Public Health Service, Robert A Taft Sanitary Engineering Center, May 1964. 146 p, 22 fig, 31 tab, 78 ref. FWPCA Project 17070---05/64.

Descriptors: *Waste water treatment, *Economics, *Injection, *Underground storage, Water reuse, Waste water disposal, Waste disposal.
Identifiers: Spreading, *Ultimate disposal.

Cost estimates are made for ultimate disposal by injection to underground formation, placement in underground cavities and spreading, of the contaminants resulting from complete renovation of a municipal waste water. For injection, the process parameters were concentration of contaminants and daily volume taken respectively as 300,000, 9,000 and 300 ppm total organic and inorganic contaminants, and 1,000, 100,000 and 10 million gpd. These costs varied from $0.13 to $27 per 1,000 gallons injected (7,000 ft., 260 psi wellhead pressure, 1.187 fluid density) as the capability decreased from 2 million to 1,000 gpd. Cost is relatively independent of concentration and is very much cheaper than wet oxidation. For injection into cavities mined by conventional methods, fixed costs alone vary from $243 to $72 per 1,000 gallons at capabilities of 1,000 and 10 million gpd, respectively. Spreading is by far the cheapest method. Costs varied from $0.30 to $0.001 per 1,000 gallons as the capability varied from 1,000 (0.4-foot-per-day infiltration rate) to 10 million gpd (4.0-feet-per-day infiltration rate). Land costs had very little effect on over-all cost. Costs are 1 percent or less of other methods investigated, but spreading is severely limited because of potential groundwater pollution. (Selby-Texas)

ULTIMATE DISPOSAL OF ADVANCED-TREATMENT WASTE, PART 1. WET OXIDATION, PART 2. INCINERATION,
Louis Koenig-Research, San Antonio, Tex.
L. Koenig.
Available from NTIS as PB-168 977, $3.00 in paper copy, $0.95 in microfiche. Environmental Health Series AWTR-3, Advanced Waste Treatment Research Program, Public Health Service, Robert A Taft Sanitary Engineering Center, October 1963. 78 p, 19 fig, 11 tab, 49 ref. FWPCA Project 17070---10/63.

Descriptors: *Waste water treatment, *Economics, *Incineration, Oxidation, Waste water disposal, Waste disposal.
Identifiers: *Wet oxidation, Advanced waste treatment.

Cost estimates are made for ultimate disposal, by wet oxidation (Zimmerman Process) and incineration, of the concentrated contaminants resulting from complete renovation of a municipal waste water. For wet oxidation, nine hypothetical cases covered the flow ranges from 1,000 to 10 million gpd and organic contaminant concentration ranges from 100 to 100,000 ppm. Plant costs vary from $4 to $80 per gallon of concentrate per day capacity (10,000,000 to 1,000 gallons per day). Operating costs vary from $1.40 to $35 per thousand gallons of feed. Pre-evaporation could reduce costs. Fixed costs constitute a large proportion of total costs. A theory of the reaction mechanism is proposed. For incineration, consideration was given to the Atomized Suspension Technique, a box furnace flash dryer-Nichols Herreshoff furnace combination, and three processes under development for calcination of nuclear wastes. Estimates of pre-evaporation to 30% solids and hauling of ash were included. A flash dryer-Nichols Herreshoff furnace combination was selected. Costs per 1,000 gallons of concentrate varied from $0.57 (10,000,000 gallons per day, 300 ppm) to $68 (1,000 gallons per day, 300,000 ppm). Corresponding unit investment costs were $1.53 and $108 per gallon per day capacity. (Selby-Texas)

DEEP WELL DISPOSAL STUDY FOR BALDWIN, ESCAMBIA AND MOBILE COUNTIES, ALABAMA.
Geological Survey of Alabama, University.

Available from NTIS as PB-194 336, $3.00 in paper copy, $0.95 in microfiche. Circ-58, June 1970. 79 p, 8 fig, 10 plates, 15 ref. HUD Project Ala P-63 (G).
Identifiers: *Waste disposal, *Injection wells, *Water pollution, *Industrial wastes, *Alabama, Water pollution, Deep wells, Sedimentary rocks, Groundwater, Porosity, Stratigraphy, Permeability, Construction, Liquids, Chemical reactions, *Baldwin County (Alabama), *Escambia County (Alabama), *Mobile County (Alabama), *Water pollution control.

Baldwin, Escambia, and Mobile Counties have a combined area of 3,817 square miles and a population of 396,900 (1960 census). The area encompasses the highly industrialized Mobile metropolitan area and the port of Mobile. The area of study is underlain by sedimentary rocks of the type used as reservoirs for waste disposal in other parts of the United States. Under certain geologic, hydrologic, and geochemical conditions it is believed that deep-well injection of liquid industrial waste can be carried out effectively in southwest Alabama. Each proposal, however, must be carefully evaluated, using the criteria outlined in this report to insure against pollution of fresh-water supplies, surface and ground, and protect against damage to the environment in the subsurface or at the surface.

Phyton, Vol 26, No 2, p 191-194, November 1969. 3 fig, 11 ref. OWRR Project A-020-MASS (3).

Descriptors: *Isolation, *Bacteria, *Protozoa, *Algae, Lethal limit, Electrophoresis, Microorganisms, Electric currents, *Waste treatment, Waste water treatment.

A technique is outlined for the isolation of ciliated protozoa and green and blue-green algae from bacteria. The procedure is designed to exploit both the electrophoretic mobility of selected ciliated protozoa and flagellated algae and the apparently greater vulnerability of bacteria over protozoa and algae to the lethal affects of an electric field.

MANIPULATION OF RESERVOIR WATERS FOR IMPROVED QUALITY AND FISH POPULATION RESPONSE,
Wisconsin Dept. of Natural Resources, Madison.
Thomas L. Wirth, Russell C. Dunst, Paul D. Uttormark, and William Hilsenhoff.
Available from NTIS as PB-196 662, $3.00 in paper copy, $0.95 in microfiche. Wisconsin Department of Natural Resources, Madison, Research Report No 62, 1970. 23 p, 2 fig, 7 ref. OWRR Project B-013-WIS (4).

Descriptors: *Aeration, Dissolved oxygen, *Hypolimnion, *Nutrients, Plankton, *Epilimnion, *Eutrophication, Water temperature, Wisconsin, Water pollution control, Water quality.
Identifiers: *Reservoir management, Cox Hollow Lake (Wisc), Twin Valley Lake (Wisc).

Compressed air continuously mixed Cox Hollow Lake, an 8-year-old eutrophic reservoir, for 3 years. Winter D.O. levels were greatly improved. The elimination of severe thermal stratification in summer resulted in: (1) considerable warming of deep water, (2) disappearance of high chemical concentrations near the bottom and recurrence of D.O., (3) habitation of profundal muds by invertebrates. There were no lasting improvements in water clarity or in several fish population parameters by the end of the study, although there was an increase in fish harvest. Eutrophication prevention by continual bottom-water discharge was studied in newly formed Twin Valley Lake. The hypolimnion was anaerobic during the summer resulting in high chemical concentrations. Large amounts of N and P were released, exceeding the potential amount for an epilimnion discharge; however, eutrophication was soon exemplified in high plankton densities and overabundant rooted vegetation. By the second fall the fish population exhibited signs of developing into a lower quality fishery. In the downstream channel warmer water in winter and colder water in summer benefited the growth and survival of stocked brown trout. Although the stream environment was still unsettled after three years, it was improved greatly. (See also W71-03308)
W71-03307

SOME EFFECTS OF HYPOLIMNITIC DISCHARGES ON TEMPERATURES IN THE STREAM BELOW,
Wisconsin Univ., Madison. Water Resources Center.
Paul D. Uttormark.
Supported in part by Wisconsin Dept. of Natural Resources. Available from NTIS as PB-196 663, $3.00 in paper copy, $0.95 in microfiche. Technical Report, Water Resources Center, University of Wisconsin, Madison, 1970. 34 p, 7 fig, 2 tab, 5 ref. OWRR Project B-013-WIS (5).

Descriptors: *Temperature, *Streams, *Dams, *Impoundment, *Hypolimnion, Downstream, Lakes, Discharge (Water), Mathematical studies, Wisconsin.
Identifiers: Hypolimnitic-discharges, Temperature modification, Mill Creek (Wisc), Twin Valley Lake (Wisc).

Temperature modification in streams as a result of hypolimnitic-discharges from impoundments is investigated from both an analytical viewpoint and a case study. A one-dimensional mathematical-analysis of stream temperatures as affected by hypolimnitic discharges is outlined and the interrelationships of stream depth, flow velocity, discharge temperature, and normal stream temperatures are discussed. There are three types of temperature effects that may occur depending on the time of year and the characteristics of the impoundment. Compared to those temperatures which would have occurred in the absence of the impoundment, maximum diurnal temperatures are reduced at all points in the downstream channel only when the discharge temperature is lower than the normal minimum diurnal temperature. Hypolimnitic discharges are also likely to increase the diurnal temperature fluctuation at points in the stream below. A technique is presented by which the general temperature changes which are likely to occur as a result of hypolimnitic discharges may be estimated. Although the technique has not been tested sufficiently to judge its general merit, it provides a resonable description of the changes observed in Mill Creek. (See also W71-03307)

SOME CONSIDERATIONS FOR WAT QUALITY AND ENVIRONMENTAL PROTE TION IN WILD AND SCENIC RIV DEVELOPMENT: THE CHATTOOGA RIVE A CASE STUDY,
Forest Service (USDA). Southern Region.
Daniel D. Bacon.
In: Proceedings Water Resources Conference, M sissippi State University, State College, April 15, 1970, published by Mississippi State U Water Resources Research Institute, p 135-1 1970. 9 p, 2 fig, 2 map, 3 tab, 4 ref. OWRR Proj A-999-MISS (6).

Descriptors: *Water quality, *Water pollut sources, *Wild rivers, *Water pollution cont North Carolina, South Carolina, Georgia, Sew disposal, Sewage treatment, Recreation, Scene Turbidity, Sediment yield, Wild river act.
Identifiers: *Chattooga River (NC-SC-Ga).

The Chattooga Wild and Scenic river (NC, SC, a Ga) study included study of water quality. T Chattooga River begins on the crest of the B Ridge in North Carolina. It flows southward for miles in North Carolina, then continues for miles as a boundary between the states of So Carolina and Georgia. About 90% of the watersh area is in forest, mostly mixed pine-hardwood ty The other 10% is in general type farms includ some pasture, row crops, and orchards, the urb area of Clayton, Georgia, and roads. Raw wa quality is excellent for most parameters tested the entire river and all its tributaries except river below Stekoa Creek and Stekoa Cre proper. Poor quality on Stekoa Creek and bel Stekoa Creek in the main river was due primarily a municipality emptying raw sewage into the cre The municipality is presently constructing modern sewage treatment plant which should leviate this condition. The other parameter t shows poor water quality is the high turbidity short periods following runoff producing storm Better conservation practices on agricultural la forest land, and roads, would keep the soil in pla rather than in the stream. e purpose was to develop and field test new con-
ts for watertight mine seal and bulkhead con-
uction applicable to abatement of acid mine
ter pollution. Laboratory research determined
per materials, equipment and techniques for
structing mine seals or bulkheads. Field testing
conducted on remedial grouting techniques for
structing mine seals or bulkheads. Two new
cesses were developed. One involved a
nique of placing a plug of graded limestone ag-
gate in a mine drift or portal to neutralize an
mine water discharge until a seal was effected.
the process, precipitation of iron hydroxide
dually closed the pores. A pneumatic conveying
nique permitted placement of up to 550
nds per minute of aggregate into a mine drift.
second process consisted of remotely con-
cting a mine seal including rear and front bulk-
ds of a self-supporting, quick-setting sodium sil-
e cement specifically developed for this appli-
on. A filler material of expansive cement was
between the bulkheads to complete the seal.
d testing in West Virginia substantiated the
ibility of both processes when two aggregate
two bulkhead type seals were placed in aban-
ed mines which had drainage flows up to 58 gal-
per minute. Cost of the seals are reported.

tifiers: *Fossil fuel, Monticello nuclear plant.

article discusses the future of nuclear power
ts as compared with fossil-fuel power plants.
city of fossil fuels, their rising cost and
lems of air pollution from burning them have
ed a turn-around in the outlook for nuclear
er. The coal shortage may be worse than at first
ected, due to the fact that only a fraction of the
rves are economically accessible. To a lesser
ee the status of the fuel oil supply is similar to
of coal. The same is true of natural gas. In
contrast is nuclear fuel, current exploration
ram has nearly doubled prime reserves of
8, the most abundant nuclear fuel raw materi-
Three fundamental reasons for the expected
inance of nuclear power are: low unit cost, its
ability, and the small volume of effluents from
ear plants compared with fossil fuel plants. The
cipal use of nuclear power in the future, other
electrical power generation, is sea water
lination. The multipurpose plant or nuclear
plex (nuplex) will permit the thermodynamic
ntial of high temperature steam to be used for
r generation and the lower-quality heat for
llation and heating. (Herrera-Vanderbilt)

ld and laboratory evaluation of lining materi-
roposed for use in brine disposal ponds was
ucted. Flexible membrane linings were the most effective for seepage control, followed by hard-surface linings, compacted earth, and soil sealants. The investigation and other studies show that soil sealants only reduce seepage and do not affect a complete seal, and that the service life of soil sealants is questionable. Recommendations on a monitoring system for measuring seepage losses from brine disposal ponds are included. (Morrison-Office of Saline Water)

Descriptors: *Farm wastes, *Sails, Nitrogen, Phosphorous, Potassium, Soil water, Water pollution, Soil contamination, Soil surveys, Nutrients, Fertilizers, Soil properties, Value, Soil chemical properties, Soil physical properties, Soil erosion, Sedimentation, Minnesota.
Identifiers: Waste disposal medium.

Pollution of the soil-water complex occurs mostly because we have no other medium for waste disposal. The author discusses the various reactions which can be expected in soil with respect to nitrogen, phosphorous and potassium. The importance of erosion and sedimentation control is also pointed out. It was stressed that considerable additional information is needed if we are to maximize the use of the soil as a waste disposal medium in such a way as to minimize pollution. We must manage our natural resources to accomodate our waste disposal needs with a minimum of pollution and still produce nutritious food in adequate amounts for our rapidly increasing population. RAISING LIVESTOCK IN THE URBAN FRINGE,
Iowa State Univ., Ames. Dept. of Agricultural Engineering.
J. Ronald Miner.
Agricultural Engineering, Vol 51, No 12, p 702-703, December 1970.

Descriptors: *Odor, *Pollution abatement, Farm wastes, Pollutants, Legal aspects, Livestock, Planning management.
Identifiers: Urban-fringe.

More people in this country demand more and better-quality livestock production. However, the population is extremely sensitive to water and air quality. The livestock producer should recognize that there will soon be no livestock production area where environmental pollution is acceptable. All livestock production enterprises must be planned as though they will operate in the urban fringe. Livestock production units can and do cause pollution of the air and waterways if improperly managed. The most frequent complaint leveled at urban-fringe livestock production is that of odors. Through proper design and management the livestock operations may be made acceptable to the public. (Christenbury-Iowa State)

LEGAL RESTRAINTS ON AGRICULTURAL POLLUTION,
Virginia Polytechnic Inst., Blacksburg. Water Resources Research Center.
William R. Walker.
In: Relationship of Agriculture to Soil and Water Pollution; Proceedings, Cornell University Conference on Agricultural Waste Management, Rochester, January 19-21, 1970, Ithaca, 1970, p 233-241. 31 ref.

Descriptors: *Water pollution, *Farm wastes, Water Quality Act, Legislation, Discharge, Pesticides, Riparian rights, Odors, Zoning.
Identifiers: *Agricultural pollution, *Common law, State regulations, Federal regulations, Equity, Trespass, Liability, Nuisance, Negligence, Strict liability.

The basis is discussed for recovery under common law for agricultural pollution. These include actions for trespass, nuisance, negligence, and strict liability. However, agricultural pollution is not likely to be effectively controlled with private litigation. The federal government has the necessary legislation to play a leading role in agricultural water pollution abatement and it is designed to encourage the states to take a more aggressive role. Public awareness of the seriousness of the pollution problem in general is ever increasing. State laws banning the use of DDT, and HEW decisions to phase out the use of some of the persistent pesticides would indicate that public pressure for action in the field of agricultural pollution will be increasing. Thus there would seem to be little doubt that the law has a continuing and expanding role to play if agricultural pollution is to be controlled. (See also W71-03542) (White-Iowa State)

William Whipple, Jr., Frank W. Dittman, and Shaw L. Yu.
Water Resources Bulletin, AWRA, Vol 6, No 6, p 968-979, December 1970. 1 fig, 14 ref.

Descriptors: *Aeration, *BOD, *Optimization, *Dissolved oxygen, *Water quality control, Oxygen sag, Water Pollution treatment.
Identifiers: *Instream aeration, *Induced oxidation, *Oxygen dispersers.

The proof is rapidly mounting that instream aeration is a technically and economically feasible supplement to secondary treatment of wastes, an alternative to tertiary waste treatment. Some phenomena remain unexplained; and competing technologies, especially those employing molecular oxygen, are being explored vigorously. However, there are convincing arguments in favor of aeration on theoretical grounds, proved technology is available; and the first installations have already been made. While remaining questions are being further investigated, it is time to consider in more detail the broader aspects, as to the institutional, legal, and political hurdles to be overcome before advantage can be taken of the new technology. This paper first summarizes the state-of-the-art as far as technology is concerned; and then outlines the institutional problem. (Whipple-Rutgers)

WATER POLLUTION CONTROL AND ABATEMENT.
Iowa State Univ., Ames; Iowa Univ., Iowa City.

Ames, Iowa State University Press, Wilbrick, Ted L. and Hines, N. William, editors, 1965. 194 p.

Descriptors: *Water pollution, *Water quality, *Economic evaluation, Engineering, Water law, Waste water, Municipal water, Industrial water, Agriculture, Recreation, Sewage, Government, Water use, Waste disposal, Economic analysis.
Identifiers: *Iowa, Pollution control agencies.

This book is the result of the Iowa Water Resources Pollution Control and abatement seminar held at Iowa State University on November 9-11, 1965. The first part presents the water pollution problem as seen through the specialized vision of four different disciplines: engineering, economics, law and political science. The second part contains papers dealing with the present water pollution, and waste water disposal situations in the state of Iowa. The last section deals with the interest groups most often involved in conflicts over pollution issues: municipalities, industry, agriculture interests and outdoor recreation. Identifiers: *Efficient charges, Regional organizations, Externalities, Market forces.

A number of national laws exist which are concerned with federal participation in water pollution control activities. The author points out that these have been somewhat successful but that a serious problem still exists. The economic considerations involved are discussed and it is shown that the application of conventional control practices have not resulted in a balancing of costs and returns to achieve maximum benefits from an optimum system for the control of waste disposal. The paper discusses the main issues in water quality management; the determination of water quality, the divising of the best physical system for achieving that quality and the determination of the best organizational and institutional arrangements for administering and managing water quality. The author finds that an effluent charge, weighted by the relative damaging effects of various effluents could be used to finance measures on a regional scale. In the concluding section, the role of regional organizations is discussed. (See also W71-03610) (Murphy-Rutgers)

ECONOMICS OF WATER QUALITY,
Iowa State Univ., Ames.
John F. Timmons.
In: Water Pollution Control and Abatement, Ames, Iowa State University Press, edited by Wilbrick, Ted L, and Hines, N. William, 1965, p 33-50.

Descriptors: *Water quality, *Economic analysis, Maximization, Welfare economics, Costs, Water use, Water demand, Pollution, Population, Water supply, Water law, Technology, Government, Optimization, Budgets, Prices, Cost benefit analysis, Measurement.
Identifiers: *Pollution control, Economic development, Institutions, Quality differentiation.

Water quality problems are explained within an economic framework designed for maximizing the satisfaction of human wants from the use of water. This study considers both the direct as well as derived demands for water in addition to the goods and services water helps produce. Investigation is made into the nature of and the growing demand for water and the economic dimension of water quality problems in relation to physical and structural dimensions, supply and demand characteristics, use interrelationships, and costs and benefits associated with particular uses and use methods. PROBLEMS IN ACHIEVING SOIL AND WATER CONSERVATION.
National Academy of Sciences, Washington, D.C.

In: Readings In Resource Management and Conservation, Chicago, University of Chicago Press, 1965, p 516-527.

Descriptors: *Conservation, *Water resources, *Soil conservation, Population, Economic evaluation, Multiple-purpose projects, Time, Technology, Benefits, Costs, Government, Uncertainty, Recreation, Dams.
Identifiers: *Mixed objectives, Productivity, Exports, Imports, Scale of development.

In this paper an attempt is made to identify major problems which are hampering water and soil conservation efforts. The paper begins by explicitly defining the nature and meaning of conservation. It also looks at the nation's need for natural resources in the future, based upon projections of population growth, changing technology, exports and imports, and various uncertainties regarding the future. The problems stemming from the mixed objectives of resource conservation programs and the different viewpoints of many of the participants are then discussed. There is an evaluation of the conflicts which tend to arise in conservation programs, including those between major land and water uses, those arising in the practices and uncertainties of physical and biological reactions, those involved in the scale of development, and those arising from different time preferences. The last section of the paper studies how benefits and costs of conservation developments should be shared: (1) between public and private interests, (2) between individuals, (3) between private individuals and groups, and (4) between units of government. CTIONAL EVALUATION OF A WATER OURCES SYSTEM;
R. Beard.
Hydrologic Engineering Center, Technical r No 4, Jan 30, 1967. 18 p, 2 fig, 6 tab.

riptors: *Reservoir operation, Water manage- (Applied), Watershed management, Com- models, Computer programs, Multiple purreservoirs, Reservoirs, Planning, Simulation sis.
ifiers: *Reservoir evaluation.

This paper describes an elaborate computer program which simulates the operation of a water resource system for conservation functions such as water supply, power generation and low flow regulation. Constraints imposed by flood control requirements are recognized, but flood control operation is not included in the program. The functional evaluation includes the determination of water and power deliveries and shortages. The program will handle multiple river basin systems with any number of reservoirs, diversions and power plants. Input data must include specifications of the system configuration, details of component capacities, inflows and evaporation. Great flexibility exists in the detail of the input data. Regular and irregular operation intervals may be simulated, and seasonal and annual variations in system requirements and controlling factors are included in the program. A computer with a large memory and high speed is required for the use of this program. (Hewett-Rutgers)

THE STUDENT'S T TEST IN MULTIPLE REGRESSION UNDER SIMPLE COLLINEARITY,
Northeastern Univ., Boston, Mass; and Baruch Coll., New York.
Bruce Cohen, and Damodar Gujarati.
Journal of Financial and Quantitative Analysis Vol V, No 3, p 341-351, September, 1970.

Descriptors: *Statistics, *Mathematical studies, *Regression analysis, Model studies, Monte Carlo method, Correlation, Sampling, Baste-squares method.
Identifiers: *T test, *Multicollinearity.

The validity is discussed of the conventional t tests on regression coefficients when there is serious multicollinearity in the explanatory variable. The study attempts to show that the conventional t tests will, in practice, reflect the rise in the true standard errors of the regression coefficients due to increasing multicollinearity. The paper also points out the danger involved in mechanically dropping variables from multiple regression equations based on t tests. This danger is present because, although the t values of the regression coefficients may not be significantly different from zero, the true values of these coefficients are in fact not zero if the explanatory variables are highly intercorrelated. These results are illustrated with Monte Carlo experiments. This paper is relevant to empirical water research using correlation techniques which depend on the standard t test to establish statistical significance. (Murphy-Rutgers)

ENVIRONMENTAL REPERCUSSIONS AND THE ECONOMIC STRUCTURE: AN INPUT-OUTPUT APPROACH,
Harvard Univ., Cambridge, Mass.
Wassily Leontief.
The Review of Economics and Statistics, Vol 52, No 3, p 262-271, August 1970.

Descriptors: *Input-output analysis, *Pollutants, Economic growth, Value added, Regional analysis.
Identifiers: *Environmental disruption, Externalities, Structural matrix, Input coefficient, Inversion, Final demand, Final consumption.

The incorporation of externalities such as pollutants into conventional input-output analysis is considered. Pollution is a by-product of regular economic activities and can be related in a measurable way to some particular consumption or production process. The quantitative dependence of the external output or input on the level of conventional activities is described by a technical coefficient and incorporated in the structural matrix of the economy. Therefore, within the input-output system, any change in the output level of pollutants can be traced either to changes in final demand for goods and services, changes in technical structure or a combination of both. Through examples, the author shows the effects of a given technological change in output on pollutants and the effects of such a change on sectoral and total demand for the factor. With given value added coefficients, one can estimate the effect of such a change on prices of various goods and services. This method can be applied in a regional or sectional basis and is relevant for water resource planners. (Siegenthaler-Rutgers)

ENVIRONMENTAL DISRUPTION AND SOCIAL COSTS: A CHALLENGE TO ECONOMICS,
Basel Univ. (Switzerland).
William K. Kapp.
Kyklos, Vol 23, No 4, p 833-848, 1970.

Descriptors: *Welfare economics, *Economic efficiency, *Water pollution, Air pollution, Resource allocation.
Identifiers: *Environmental disruption, *Social costs, Externalities, Feedback effect, National accounting, Shadow price.

The ability is considered of conventional economic theory to deal with the problems of social cost and environmental disruption. Environmental disruption is defined to include man's natural and social environment. Through examples of air and water pollution, the article demonstrates that problems of environmental disruption have complex interdependencies and delayed feedback effects of a nonmarket nature. Economic theory concentrates on and treats production, allocation, distribution, and exchange as if they occurred in a closed sphere and hence the theory often omits their effect on man's social and natural environment. Moreover, environmental disruption challenges the validity of traditional measures of efficiency and optimalization. As an alternative, it is suggested that economic theory abandon its concentration on purely formal definitions of utility and efficiency and adopt an approach related to human needs and requirements in the form of interdisciplinary research. (Siegenthaler-Rutgers)

GEOMETRIC PROGRAMMING: NEW OPTIMIZATION TECHNIQUE FOR WATER RESOURCE ANALYSTS,
Texas A and M Univ., College Station; and Texas Univ., Austin.
Wilbur L. Meir, Robert W. Lawless, and Charles S. Beightler.
In: Proceedings of the Fourth American Water Resources Conference, Commodore Hotel, New York, November 18-22, 1968, St. Anne, Illinois, Record Press, 1968, p 524-533.

Descriptors: *Optimization, *Cost minimization, *Water resource development, Economic evaluation, Mathematical studies, Computers, Costs, Model studies, Planning, Systems analysis.
Identifiers: *Geometric programming, Computer algorithm, Nonlinear programming.

The optimization technique of geometric programming is described and its adoption by the water resource analyst is recommended. This method permits the direct solution of a large class of optimization problems which were previously solved by approximating techniques. Invariance properties, which often are discovered as by-products of the solution algorithm, provide insight into the system being analyzed. The authors feel that many water resource optimization problems can be efficiently solved using this technique. The advent of computer algorithms for geometric programming holds promise to make this technique even more useful in the future. (See also W71-03625) (Murphy-Rutgers)

THE METHODOLOGY OF WATER-RESOURCE SYSTEM DESIGN,
Harvard Univ., Cambridge, Mass.
Maynard M. Hufschmidt.
In: Readings in Resource Management and Conservation, Chicago, University of Chicago Press, 1965, p 558-570.

Descriptors: *Water-resources, *Optimization, Systems analysis, Economic efficiency, Income, Benefits, Costs, Decision-making, Technology, Investment, Demand, Economic evaluation, Government, Discount rate, Risk, Water supply, Capital costs, Rivers, Computers, Floods, Sampling, Streamflow.
Identifiers: *Water-resources system design, Present value, Lehigh River.

The author presents a methodology of water-resource system design for the purpose of incorporating new techniques into the planning method. Water-resource design involves application of decision-making techniques to investment problems in a systematic context and thus a workable methodology for design must be capable of dealing effectively with these attributes. The author devises a methodology with four related steps: (1) specifying the objectives of design; (2) translating these objectives into design criteria; (3) using the criteria to formulate specific designs of development and management for water-resource systems that fulfill the optimization objectives to the highest degree; and (4) evaluating the consequences of the designs which have been developed. COST/EFFECTIVENESS ANALYSIS: ITS TASKS AND THEIR INTERRELATION,
General Electric Co., Santa Barbara, Calif. TEMPO.
David S. Fields.
Operations Research, Vol 14, No 3, p 515-527, May-June 1966.

Descriptors: *Systems analysis, Resource allocation, Uncertainty, Evaluation, Mathematical model, Economic efficiency, Peak load capacity, Flow, Constraint.
Identifiers: *Cost/effectiveness analysis, Iterative process, System characteristic, Performance model, Cost model, Feed back process.

The application of the general theory of cost effectiveness to specific systems is considered. Cost effectiveness analysis indicates how alternative design decisions are related to systems costs as a function of system effectiveness. It identifies the values of the variable characteristics to be considered in changing the system and enables the decision-maker to evaluate systems and choose the one with the preferred characteristic. After the problem is clearly stated, the tasks are to consider alternative systems, establish an evaluation basis, formulate mathematically the relationship between system costs and the characteristic models and to analyze system costs versus effectiveness. The analysis of system costs versus effectiveness indicates the tradeoff among alternative systems. A preferred value can be determined for each effectiveness level and it is the minimum cost point. Thus, the method permits the decision-maker to select the system best suited for his requirements given resource constraints. This article is relevant for water resource planners concerned with methods to evaluate investment alternatives. (Siegenthaler-Rutgers)

Available from NTIS as PB-196 901, $3.00 in paper copy, $0.95 in microfiche. Environmental Resources Center, Georgia Institute of Technology, ERC-0570, September 1970. 88 p, 25 fig, 18 ref. OWRR Project A-023-GA (1).

Descriptors: *Water quality management, *Water quality control, *Water quality dynamics, *Social impacts, *Political constraints, *Economic conditions, Institutional constraints, Decision making, Public attitudes, Simulation analysis, Systems analysis.
Identifiers: *DYNAMO simulation language.

The objective of the research was to identify and demonstrate how the management and control of water quality in a region is influenced by prevailing social, political and economic conditions and to illustrate how these prevailing conditions and attitudes interrelate in an information feedback and control system to produce traditional modes of system response. A generalized model was tested under a wide range of policies and parameters to illustrate system response and sensitivity to changes. Industrial dynamics was used to model the multiloop, non-linear feedback system, and the DYNAMO simulation language was used to program the model for digital computer simulation, testing, and experimentation. The modeling phase isolated system variables and identified their relative magnitudes, periods and phasing in historically polluted watersheds. Different policies and parameters were tested in a refined model to determine their effect on total system response. Water quality management and control was found to be deeply embedded in a complex, information feedback system involving social, political and economic pressures and forces. The complex system response was found to be insensitive to many parameter changes and unintuitive in behavior. Some critical points were found and programs directed at these points showed significant changes in system response. (Conway-Georgia Tech)

FACTORS AFFECTING RELOCATION IN RESPONSE TO RESERVOIR DEVELOPMENT,
Kentucky Water Resources Inst., Lexington.
Rabel J. Burdge, and Richard L. Ludtke.
Available from NTIS as PB-196 659, $3.00 in paper copy, $0.95 in microfiche. Partial Technical Completion Report; Project Period: January 1, 1969 - August 1, 1969, Research Report No 29, 1970. 33 p, 3 tab, 12 fig, 19 ref, append. OWRR Project A-020-KY (2).

Descriptors: *Social change, Social aspects, *S
cial impact, *Attitudes, Social values, Kentuck
*Rural sociology, Flood control, Reservoir.
Identifiers: Human migration.

The focus is on the question of how rural peop
anticipate forced moves as a result of flood cont
projects and how they change their life accepti
separation from familiar surroundings. A model
faced migration is presented which sees the var
bles of socio-economic status, knowledge of res
voir projects, vested interests and the degree
identification with place of affected persons
producing differential apprehension over movi
Differential apprehension is then seen as produci
different attitudes toward the project which will
fluence the type of migration plans. To test t
model of forced migration, data were obtained
means of personal interview with 261 adu
located in two areas about to be flooded by m
tipurpose reservoirs. Goodman and Krusha
gamma was used as the measure of association
the ordinal data. Basic to the model were the t
findings that (1) apprehension over moving rela
inversely with people's willingness to separ
themselves from their current friends and hom
and (2) that people with favorable attitudes tow
flood control projects were less apprehensive o
moving and as a consequence were more willing
engage in moves that require greater degrees
separation from their current friends and types
residences. Other findings suggest that those p
sons whose vested interests would be enhanced
the reservoir project can be expected to engage
moves requiring the greatest amounts of so
separation. Knowledge of the reservoir project
its purposes did little to meliorate people's attitu
toward the reservoir project or to facilitate ease
moving. A new variable 'identification with pla
developed for this study, was found to re
strongly with apprehension over moving.

A central observation of this summary is the ex
sion of desert areas throughout the world bec
of human mismanagement. Existing arid areas
generally deteriorated in terms of soil, water
plant life. A major factor is overgrazing. Deve
ment plans in arid lands have usually involve
creased water supplies for augmented agricul
production. This concept of arid land develop
was challenged on several grounds. (1) Cons
tion projects receive more detailed planning
the agricultural systems they are designe
supply. (2) High intensity desert irrigation sch
require high levels of farming skills and
tenance capital. (3) Increments in per capit
come resulting from agricultural developmen
small. (4) Tourism, mining, pastoralism, low w

industry and other income-producers may be
h more desirable. Population pressures must be
viated or no progress will be possible. Sociologi-
and economic factors unique to these areas,
icularly education, have been neglected. The 3
rate major arid areas of the world are discussed
national and international means of attacking
problems are suggested. (Casey-Arizona)

t analysis.
iers: *Uncertainty, *Disutility of uncertain
*Utility function, Utility.

ncient hypothesis that equal quantities of
gained or lost have different utilities de-
g upon the circumstances of the recipient
ver been fully accepted into the main body of
mic theory. To eliminate confusion, it is es-
to abandon the attempt to quantify a utility
n of wealth or income, and to develop in-
stead a utility function of uncertain gains contin-guencies by the same individuals. The basic facts of life insurance and health insurance show that the majority of persons are prepared to pay approximately twice the actuarial value to avoid major contingencies. These results allow definition of a marginal utility coefficient for this range of losses. Small losses and moderate gains apparently have utility coefficients approximating unity. A working hypothesis based upon the above is consistent with evidence as to risk aversion from the securities markets. The most important characteristic of the utility function is a high disutility of major unexpected losses, which is disproportionate to the marginal utility of gains or losses under ordinary circumstances. Application of the above conclusions provides a rational basis for an additonal component of flood control benefit in some cases, and should help to clarify what has been considered an anomaly in the opportunity-cost theories of social discount rate. ANNUAL REPORT 1970 DELAWARE RIVER BASIN COMMISSION.
Delaware River Basin Commission, Trenton, N.J.

Delaware River Basin Commission, Box 360, Treton, New Jersey 08603, 1970. 60 p.

Descriptors: Water quality control, Estuaries, Environment, Waste treatment, Water quality, *Delaware River, *Delaware River Basin Commission.
Identifiers: *Regional water quality administration, *Regional sewerage system, *Pollution abatement schedules.

This annual report of the DRBC contains certain items of considerable economic importance. Proposals have been made by a group of large oil companies for a large off shore loading terminal in the lower end of the Delaware estuary, in order to accommodate super tankers. This apparently feasible project (on an economic basis) has been suspended as part of a general freeze on coast line developments by the governors of New Jersey and Delaware, in the interest of environment protection. Pollution abatement schedules have been worked out with 41 large municipal and industrial waste dischargers. Generally schedules require full compliance by 1973; but the city of Philadelphia has been given more time, since in that case compliance will require expenditures of $75 million. To serve some 30 miles of shoreline on the New Jersey side of the estuary, a regional waste treatment system is proposed. A dozen participating municipal and industrial dischargers are sharing the $1.3 million cost of a pilot plant study, which has shown that 90% effectiveness in treating the combined wastes could be achieved. LECTURES ON WATER MANAGEMENT.
Dept. of Environmental Engineering Science. Johns Hopkins Univ., Baltimore, Md.

Water Management Seminar, October 1964-May 1965. Johns Hopkins University, Baltimore. 352 p.

Descriptors: *Water management (Applied), Economics, Water utilization, Water resources development, Political aspects, Water law, California, Maryland, United States.
Identifiers: Canada.

This series of twenty-four lectures covered a wide scope of topics focusing on uses of water resources and their development and management. Water resources law and politics as well as the economics of water resource development and use were dealt with by several authors. Specifically mentioned were brief case studies of the California Water Plan, the Maryland Water Supply Study and Canada - U.S. international water problems. Appropriate portions of the publication are forwarded with abstracts of those portions. (See also W71-03595 thru W71-03596) (Holmes-Rutgers)

WATER TRANSFERS: ECONOMIC EFFICIENCY AND ALTERNATIVE INSTITUTIONS,
Colorado State Univ., Fort Collins; and Calgary Univ. (Alberta).
L. M. Hartman, and Don Seastone.
Baltimore, Johns Hopkins Press, 1970. 127 p.

Descriptors: *Water transfers, *Economic efficiency, *Water law, Economic evaluation, Water supply, Districts, Computers, Water resource allocation, Income, Taxes, Government, Prices, Costs, Spillover, Irrigation, Water use.
Identifiers: *Externalities, Colorado, New Mexico, Income effects, Water institutions.

The extent is examined to which existing organizational arrangements for the management of water resources permit reallocations to take place efficiently. The study centers on the analysis of externalities and water law. The relation between diversion and consumptive use of water transfers creates a common externality. The effect on the supply of resources to third parties is analyzed along with the conditions required for efficient transfers of water. The study also presents a comparative analysis of the performance of the Colorado and New Mexico legal systems for regulating water transfers. Other chapters report on typical organizational forms, namely, the ditch company and two different water conservancy districts. A theoretical discussion of the income interdependency effect in water transfers between communities is presented and in the concluding chapter some estimates of this effect are computed. (Murphy-Rutgers)

STRATEGIES OF AMERICAN WATER MANAGEMENT,
Chicago Univ., Ill.
Gilbert F. White.
Ann Arbor, University of Michigan Press, 1969. 149 p.

Descriptors: *Water management, *Water supply, *Planning, Irrigation, Multiple purpose projects, Floods, Municipal water, Water demand, Economic evaluation, Drainage basins, Dams, Hydropower, Regional analysis, Technology, Water quality, Costs.
Identifiers: *Multiple means, *Regional integration, *Single purpose projects.

Different ways are examined in which water is and has been managed for the purpose of finding more suitable ends and means of manipulating the natural water system. The first chapter outlines a framework in which a society's water management decisions may be examined. The remainder of the book is devoted to the major strategies which have been practiced in the United States. Of these, single purpose construction is the oldest and most widespread water management strategy and the author explains how the decisions of this technique are made. This concept has developed into multiple purpose projects and multiple means. The author discusses the problems and possible solutions of determining public preferences in addition to considering the role of research in water management. The concluding chapter deals with the water management strategy of regional integration. A method of planning is developed for a metropolitan area or group of drainage basins which continually explores multiple means of reaching multiple ends. (Murphy-Rutgers)

WATER RESOURCE ALLOCATION, EXTRA MARKET VALUES, AND MARKET CRITERIA: A SUGGESTED APPROACH,
Oregon State Univ., Corvallis.
Emery N. Castle, and Herbert H. Stoevener.
Natural Resources Journal, Vol 10, No 3, p 532-544, July 1970.

Descriptors: *Water resource allocation, *Market value, Economic evaluation, Operations research, Cost-benefit analysis, Water pollution.
Identifiers: *Public good, Externalities, Indivisibility, Consumer surplus.

The role of the market is discussed in generating information for decision makers concerned with extra-market problems. For water resources, the market has been modified or eliminated as a means of resource allocation. The reasons for the development of alternatives to the market for water resource allocation stem from a number of sources including the existence of technological interdependencies, indivisibility and the existence of water as a public good. Even when the market may fail, the logic of resource allocation which is a part of market price theory can be very valuable in the creation and the evaluation of market alternatives. The society evaluates returns relative to costs in deciding the optimal level of use. One alternative with respect to water pollution is that polluters should be charged a fee per unit for waste discharge which is economically efficient. The second example is wide scale water diversion. Operations research techniques have been used to consider possible alternatives while simulating market operations. The final example given is for outdoor recreation where research is directed one more toward simulating market criteria. (Siegenthaler-Rutgers)

WATER QUALITY ENVIRONMENT AS RELATED TO INDUSTRY,
Great Western Sugar Co., Denver, Colo.
Lloyd T. Jensen.
In: Man and the Quality of His Environment, Boulder, University of Colorado Press, 1968, p 59-65.

Descriptors: *Water quality, *Industrial water, *Industrial wastes, Municipal water, Prices, Costs, Water demand, Treatment costs, Pollution, Government, Taxes, Population.
Identifiers: *Great Western Sugar Company.

The importance is outlined of adequate water resources to industrial enterprizes as well as the nature of industrial water use. This need for good quality water is often in conflict with the needs of other water users and the problems of this divergence are discussed. As an example of an effective industrial program the author explains the situation of the Great Western Sugar Company which involves in-plant control of wastes, then moves to by-product recovery, then reuse, then recycling and finally treatment. There are a number of different alternatives available for water quality management which involve different prices for water due to different treatment costs. Meeting future water needs will necessitate a considerable amount of planning and will be extremely costly. (Murphy-Rutgers)

ECONOMIC FRAMEWORK AND ASSOCIATED BASIC STUDIES,
Department of the Interior, Atlanta, Ga.
Ned L. Williams.
In: Organization and Methodology For River Basin Planning, Atlanta, Georgia, Georgia Institute of Technology, 1964, p 157-185.

Descriptors: *Water resource development, *Economic evaluation, *Planning, Government, Water law, Financing, Transportation, Regional analysis, Costs, Land use, Population, Investment, Agriculture, Water supply, Prices, Hydropower, River basins.
Identifiers: *USSC, *SERB, Econometrics, Economic studies, Migration.

The basic economic studies of the U. S. Study Commission (USSC) for the Southeast River Basins (SERB) are discussed. These studies described the present level and past trends of the SERB area and the national economy, the projected level of the economy and related growth factors, and the requirements for resource developments in a form suitable for planning future resource development programs. The paper also makes mention of other studies which provide needed insight into such considerations as water law, financing, transportation and migration. The author devotes a section to the staff organization as related to the acquisition, evaluation, presentation and use of the economic studies. The methodology of the studies is examined and the concluding section discusses the more unique, distinctive and experimental aspects of the studies. (Murphy-Rutgers)

ECONOMIC FACTORS AFFECTING SYSTEM DESIGN,
Harvard Univ., Cambridge, Mass.
Stephen A. Marglin.
In: Design of Water Resource Systems, Cambridge, Harvard University Press, 1962, p 159-225.

Descriptors: *Water resources development, *Budgets, *Optimization, *Investment, *Economic evaluation, Costs, Government, Benefits, Time, Rate of discount, Interest rate, Water supply, Mathematical studies, Water demand, Planning, Prices.
Identifiers: *Water system design, Opportunity costs, Present value.

The economic factors effecting the objectives and concepts of water system design are examined. This paper provides an analysis of the influence of the budgetary constraint, in various forms, on the optimal system design. The problems raised for system design by the dynamic nature of the investment process are treated. Since costs and benefits occur in time streams, the objective is to obtain the optimal investment schedule as well as design for system units. The choice of interest rates for public investment in water resource development is discussed and a method by which the opportunity costs of public investment can be calculated in a mixed private-public economy is provided. In the last section certain problems raised by specific external alternatives to water-resource systems are examined. (Murphy-Rutgers)

PUBLIC ECONOMICS,
Stanford Univ., Palo Alto, Calif.; Paris Univ., (France).
J. Margolis, and H. Guitton.
London, Macmillan, 1969. 574 p.

Descriptors: *Resource allocation, Risk, Optimization, Economic efficiency, Public administration, Welfare economics.
Identifiers: *Public goods, *Pareto criteria, Equity, Social objective function.

This book presents the papers given at a 1966 conference on Public Economics. These papers present an analysis of public production and consumption and their relations to the private sector. The central theme is the economic analysis of the public sector. The papers deal with the extension of economic theory to the public sector, the pricing and investment behavior of public enterprises and rules for their efficient operation, economic issues within public administration, and the public enterprise in a socialist setting. The economic theory papers discuss the theory of public goods and the problems of supplying the optimal amount of these services. Distributional aspects were analyzed to satisfy equity as well as efficiency conditions. The papers on pricing demonstrate that the marginal cost pricing rule is too unsophisticated to deal with the complex public enterprise. This book is relevant for water planners concerned with public goods theory and the implications of this theory for decision making criteria and resource allocation. RISK TAKING AND RESOURCE ALLOCATION,
Institut National de la Statistique et des Etudes Economiques, Paris (France).
E. Malinvaud.
In: Public Economics, London, Macmillan, 1969, p 222-246.

Descriptors: *Risk, Resource allocation, Public decision, Welfare economics, Probability distribution.
Identifiers: *Risk aversion, Net benefit, Technical constraint, Pareto optimum, Social utility function, Present value, Capital market, Contingent goods.

The effect of risk on public decisions is discussed. The presence of risk affects the social objective to be assigned to the public allocation of resources. The social objective or norm is the maximum of the social consumption plans. The author contends that the social ethic implies that collective choices exhibit risk aversion. He then considers how risk is included in the economic calculation preceding public decision-making. Risk constitutes an extra cost and can be included through increases in the discount rate or in a security margin which increases expected costs for large risks. The result is that uncertain operations must be reduced in favor of super operations if both operations produce the same commodities but not necessarily if they produce different outputs. Public policies toward risk-taking should have three purposes: to eliminate the individual risks affecting firm management but not the community; to reduce discrepancies among evaluations of the same risks by private firms; and to ensure that private attitudes agree with social attitudes. Suggestions for future research are offered on the level of risk aversion implied for firms by the social utility function and on risk aversion. This article is relevant for water planners concerned with the role of risk in investment decision-making theory. (See also W71-03616) (Siegenthaler-Rutgers)
W71-03617

GENERAL EQUILIBRIUM WITH PUBLIC GOODS,
California Univ., Berkeley.
R. Dorfman.
In: Public Economics, London, Macmillan, 1969, p 247-275.

Descriptors: *Welfare economics, *Decision making, Marginal cost, Political constraint, Budget constraint, Net benefit, Marginal utility.
Identifiers: *General equilibrium, *Public goods, Externality, User charge, Convexity, Tax burden, Objective function, Willingness-to-pay, Citizen, Surplus, Concave programming, Shadow-pricing,

ome redistribution, Consumer surplus, Social welre function.

ublic goods are ordinary economic goods except at their use can not be rationed nor can their enefits be allocated. Decisions about public goods e made socially or politically. The approach is to e a general equilibrium model to which a governent sector has been added. The model assumes ly socio-economic groups have preference maps r public goods. The process of gaining public acptance for government proposals involves the rsuasion of political leaders who then convey the ogram to their following. The model is formuted as a concave programming problem approxiating government behavior given preferences, essures and prices. The approach is that of llingness-to-pay with the government providing vels of public goods and the citizen's surplus ual to the excess of his gross benefit over the inease in taxation or burden necessitated by the ineased public good consumption. It is argued that ere is a price vector used by the government ich brings general equilibrium in the economy. ccordingly, the level of public goods will be chnically efficient. The model allows the general uilibrium theory apparatus to be used for idance in public goods decisions and indicates e social losses occurring when decisions are not egrated with tax and expenditure policy. This arle is relevant to water research activities due to development of an explicit government sector o conventional economic models. (See also 71-03616) (Siegenthaler-Rutgers)

ULTIPLE USE DECISION MAKING--WHERE O WE GO FROM HERE,
ah State Univ., Logan.
S. Whaley.
tural Resources Journal, Vol 10, No 3, p 557-5, July 1970.

scriptors: Resource allocation, *Decision mak-, Uncertainty, Economic evaluation, Costnefit analysis, Linear programming.
ntifiers: *Multi-product, *Social cost, Technical nopoly, Public welfare, Internal rate of return, nsumer surplus.

e problem of making multiple use resource alloion decisions in the particular case of public ds is considered. When resources are publicly ned, the price system is no longer used to alate these resources. As a result, there is a lack of a on the market value of a product which makes ision making difficult. A popular approach to lic investment decision making is to evaluate difference (or ratios) between benefits and ts. However, the difficulty of assigning quantitae measures to benefits derived from non-market plied goods and services has made the applicaof benefit-cost analysis difficult (an example ng the pricing of water for recreation and nestic use). Recent research is devoted to plac- a dollar valuation on non-market supplied urces. Such methods of valuation as consumer plus, monopoly market value and cost have ited success when the values are used in urce allocation models. The author suggests a ader orientation to the multiple use problem. e market valuation system is not sufficient. First, urce management goals must be set and only n should valuation systems for benefit measurent be formulated. (Siegenthaler-Rutgers)

OCEEDINGS OF THE FOURTH AMERICAN TER RESOURCES CONFERENCE.
logical Survey, Mineola, N.Y.

American Water Resources Conference, Comdore Hotel, New York, November 18-22, 1968, Anne, Illinois, Record Press, 1968. 793 p.

scriptors: *Water resource development, ater supply, *Pollution, City planning, Municipal water supply, Cities, Aquifers, Water management, Floods, Sewers, Storm runoff, Waste water, Water quality, Economic aspects, Regional analysis, Pollution, Droughts, Water resources research, River basins, Erosion, Meteorology.
Identifiers: New York, Chicago, Wisconsin, Metropolitan area problems.

Papers were presented on the interdisciplinary interests of the participants in the fields of water-resources research, planning, development, management and education. Particular concentration was focused on metropolitan area water problems. The fifteen sessions were concerned with the water resource problems of the cities, storm runoff and waste water disposal, the economics of pollution and quality of the environment, regional water planning, super projects, flood control and flood plain management, citizen action and the problems of pollution and pollution control. Also discussed were the areas of: groundwater in the urban environment, international water-resource programs, general water resources research, droughts and other meteorological considerations, urban water resources research, and national and local water policy. The problems were analyzed critically from several aspects with suggestion of possible solutions. (See also W71-03626 thru W71-03627) (Murphy-Rutgers)
W71-03625

READINGS IN RESOURCE MANAGEMENT AND CONSERVATION.
Toronto Univ., (Ontario); and Clark Univ., Worcester, Mass.

Edited by Sam Burton, and Robert W. Kates. Chicago, University of Chicago Press, 1965. 609 p.

Descriptors: *Natural resources, *Conservation, Population, Costs, Government, Economic evaluation, Geography, Land use, Technology, Farms, Resource allocation, Social aspects, Systems analysis, Agriculture, Water resource development, Decision-making, Economic analysis, Economic efficiency, Regional analysis.
Identifiers: Economic development.

This is a collection of papers which seek to explore some of the problems of resource management and conservation. The relationship between population and the resource limits of the earth is discussed followed by chapters describing the growth of the concept of conservation and the various social, economic and ethical factors involved. The following chapter contains a number of case studies dealing with problems involved in the area of natural resource management. Next to be examined is the relationship between natural resources and the economic growth of regions and countries. The effect upon resource management and conservation of scientific and technological change is then discussed. The concluding chapter contains a number of papers on various systems methods designed to evaluate the choice of relevant alternatives for natural resource development. Although concerned with all natural resources, the book contains numerous papers dealing specifically with water resources as well as papers whose conclusions are applicable to this area. (See also W71-03632 thru W71-03643) (Murphy-Rutgers)
W71-03631

THE COLUMBIA BASIN PROJECT: EXPECTATIONS, REALIZATIONS, IMPLICATIONS,
Delaware Univ., Newark.
George Macinko.
In: Readings In Resource Management and Conservation, Chicago, University of Chicago Press, 1965, p 289-297.

Descriptors: *Water resource development, *Columbia River Basin, *Planning, *Economic justification, River basins, Government, Irrigation, Land use, Dry farming, Costs, Technology, Budgets, Government supports, Demand.
Identifiers: *Columbia Basin Project, Time lag.

The author believes that the problems which have caused a halt in the development of the Columbia Basin Project are of a nature common to other water resource projects. He attempts to provide an overview of this Project in order to indicate what future developments can be expected in the field of reclamation. The author discusses the problems arising from the time lag between planning and implementation, overruning the project costs, increases in farm size and their relation to government subsidies, and changes in land use patterns. There is a need for greater flexibility in programming, closer atunement to the state of the national economy, reduction in lag time, and new economic analysis to justify reclamation development in the face of competing demands on the nation's water resources. (See also W71-03631) (Murphy-Rutgers)
W71-03633

CONNECTIONS BETWEEN NATURAL RESOURCES AND ECONOMIC GROWTH,
Chicago Univ., Ill.
Theodore W. Schultz.
In: Readings In Resource Management and Conservation, Chicago, University of Chicago Press, 1965, p 397-403.

Descriptors: *Economic impact, *Natural resources, Productivity, Capital, Labor, Rate of return, Economic evaluation, Supply, Prices, Land use, Costs, Technology, Equilibrium, Investment.
Identifiers: *Economic growth, Primary production, Reproducible capital, Diminishing returns.

The author wishes to discover the connections between natural resources and economic growth and to dispense with the prevailing misconceptions in this area. The author's orientation is towards a theory concerning all natural resources and the economic growth of a country. However, the conclusions are readily applicable to water resources in particular and the specific water-related factors effecting regional economic growth. The paper examines the value of natural resources as a factor of production and dismisses as inadequate the view of that role originating from both the classical and Harrodian analysis. The author then investigates the contribution that natural resources can make to economic growth and finds that whether or not new forms of capital are adaptable to primary production is of vital importance in determining the role of natural resources. The article concludes by illuminating the connections between natural resources and reproducible non-human capital and the labor force. (See also W71-03631) (Murphy-Rutgers)
W71-03635

A GUIDE TO BENEFIT-COST ANALYSIS,
Chicago Univ., Ill.; British Columbia Univ., Vancouver; and Canada Advisory Committee on Water Use Policy, Ottawa (Ontario).
WRD Sewell, AD Scott, DW Ross, and John Davis.
In: Readings in Resources Management and Conservation, Chicago, University of Chicago Press, 1965, p 544-557.

Descriptors: *Benefit-cost analysis, *Economic evaluation, Investment, Rate of return, Economic justification, Project planning, Measurement, Joint costs, Decision-making, Optimization.
Identifiers: *Externalities, Sunk costs, Intangible benefits.

Benefit-cost analysis is able to provide a logical framework for the evaluation of one or more courses of action in the area of water resourse development. The authors attempt to provide a guide to the proper use of benefit cost analysis in this area. The different purposes for which benefit-cost analysis may be used are explained and exact definitions of the terms commonly employed are provided. The principles upon which benefit-cost analysis is based are given followed by an explanation of true economic cost. The results of benefit-cost analysis may differ according to the viewpoint of the evaluator. Accordingly, this viewpoint should be

clearly stated. The optimum scale for a given development occurs at a point where its net benefits are at a maximum but economic comparisons among projects may be made by: comparisons of net benefits, comparisons of rates of return, or comparisons on the basis of benefit-cost ratios. These different methods are explained and in the final section the interdependence of projects is discussed. (See also W71-03631) (Murphy-Rutgers)
W71-03636

MALTHUSIANISM AND CONSERVATION: THEIR ROLE AS ORIGINS OF THE DOCTRINE OF INCREASING ECONOMIC SCARCITY OF NATURAL RESOURCES,
Washington Univ., St. Louis, Mo.
Harold Barnett.
In: Readings in Resource Management and Conservation, Chicago, University of Chicago Press, 1965, p 204-226.

Descriptors: *Natural resource development, *Conservation, *Economic efficiency, *Pollution, Wastes, Streams, Costs, Dams, Balance of nature, Hydroelectric power, Technology, Population.
Identifiers: *Malthus, Economic scarcity, Unearned increment, Diminishing returns, Economic growth.

This article deals with the economic scarcity of natural resources relative to population and goods consumption. The basic theories of Malthus on this problem are used to construct modern economic models of the relation between natural resources and economic growth. Both a static and a growth model result from the incorporation of strategic variables. Time horizons, rate of population increase, natural resources available, technology and institutions, and the law of diminishing returns are the five constraints included to insure Malthusian results. These Malthusian projections are then juxtaposed with the views of the contemporary conservationists. The former are most concerned with quality, rather than quantity, of available natural resources. In this capacity, interest has arisen in water pollution, soil conservation, and air pollution. The conservationists plead for the wise use of resources and the avoidance of waste for the purpose of promoting economic well-being. The problem of resource scarcity is particularly acute in the area of water resources, making this article of interest to the water researcher. (See also W71-03631) (Murphy-Rutgers)

WHAT IS CONSERVATION,
Resources for the Future, Inc. Washington, D.C.
Orris C. Herfindahl.
In: Readings in Resource Management and Conservation, Chicago, University of Chicago Press, 1965, p 229-236.

Descriptors: *Conservation, *Natural resource development, *Water use, Dams, Lakes, Minerals, Forests, Irrigation, Water supply, Costs, Benefits, Streams, Fishing, Recreation, Industrial water use.
Identifiers: *Pinchot, Wildlife refuge, Private market system, Import limitation.

This article deals with the imprecision surrounding use of the word conservation. The author first treats Pinchot's definition of conservation as the use of natural resources for the greatest good of the greatest number for the longest time. Also handled is Pinchot's premise that conservation implies both the development and protection of natural resources. The author challenges the possible coexistence of these two objectives, citing as an example, the construction of a dam which necessarily interferes with the preservation of the environment's natural beauty. Conflict between varying interest groups is blamed for the preservation of Pinchot's lack of clarity in the writings of contemporary conservationists. The dam type of controversy is not the only conflict. Various types of development are also opposed to each other, such as irrigation and urban water supply. To solve these definitional problems, conservation can be regarded as a means of maximizing the return from all resources at the disposal of society. It is pointed out that in all such conservation measures, the benefits must outweigh the costs to ensure economic feasibility. Since water resources conservation is an important part of the total conservation effort, this article should be of interest to the water researcher. (See also W71-03631) (Murphy-Rutgers)

WELFARE, ECONOMICS AND RESOURCE DEVELOPMENT,
Indiana Univ., Bloomington.
J. W. Milliman.
In: Readings In Resource Management and Conservation, Chicago, University of Chicago Press, p 284-288, 1965.

Descriptors: *Water supply, *Economic evaluation, *Economic efficiency, Water demand, Prices, Elasticity of demand, Water law, Investment, Water resource development, Government, Cost-benefit analysis, Water rights, Rate of discount.
Identifiers: *Water subsidies, *Project analysis.

Conclusions and highlights are presented of a water supply study recently completed. The study was divided into the examination of the allocation of existing water supplies and a study of the alternatives for developing new supplies. They found that water supplies were grossly misallocated among and between uses and it is these misallocations which lead to claims of water shortage. The authors also believe that major water investments in the United States are typically undertaken prematurely and on an over ambitious scale. Some of the reasons for the resulting over investment in water supply are given as: the failure to adjust prices for the purpose of changing demand and the biases inherent in conventional techniques of project analysis. In conclusion, the author states that increased application of economic principles will produce greater efficiency in water supply in relation to all the other desires of the community. RATIONAL CHOICE IN WATER RESOURCES PLANNING,
Stanford Univ., Calif.
Hubert Marshall.
In: Readings In Resource Management and Conservation, Chicago, University of Chicago Press, p 529-543, 1965.

Descriptors: *Decision-making, *Economic evaluation, *Planning, *Water resources development, Economic analysis, Costs, Benefits, Interest rate, Government, Financing, Economic efficiency, Social aspects, Floods.
Identifiers: *Rational choice, *Relevant alternatives, Organizational loyalty, Professionalization, Countervailing power, Congress, Bureaucracy.

In order to assure a proper allocation of resources, rational choice in the water resources area is essential. This requires a number of correct actions. The economic evaluation of water resource project benefits have been of inferior quality causing a great deal of misinformation. The use of an appropriate interest rate is vitally necessary but the present practices fail to consider alternatives to the government cost of borrowing. The jurisdictional jealousies of the several construction agencies act as a force preventing the consideration of relevant alternatives which may result in a higher benefit cost ratio. The author also discusses various institutional arrangements which make rational decision all but impossible in the water development field. Included here is: the absence of countervailing powers, the disadvantages arising from our representative form of government, and individual loyalty to the agency organization. In the final section the author deals with the professionalization of economists in government service and shifts in the location of the decision making authority in the national government as possible solutions to the problem. NATURAL RESOURCE ENDOWMENT AND REGIONAL ECONOMIC GROWTH,
Resources for the Future, Inc., Washington, D.C.
Harvey S. Perloff, and Lowdon Wingo.
In: Readings In Resource Management and Conservation, Chicago, University of Chicago Press, p 427-442, 1965.

Descriptors: *Natural resources, *Regional analysis, Technology, Economic analysis, Industrial production, Agriculture, Income, Demand, Population.
Identifiers: *Resource endowment, *Economic growth, Heartland-hinterland, *Cumulative advantage.

An adequate water supply is a vital parameter in determining the economic future of an area. This paper is concerned with the relationship between the natural resources (including the water resources) of a region and the nature of economic expansion. The authors find that resource endowment is continuously redefined by changes in final and intermediate demand, production technology and economic organization. The relative economic growth of a region is directly related to its relative advantages in the production of goods and services for the national market. The working out of cumulative advantage is exhibited in the specialized role which a region plays in the national economy, and this specialized role can best be described in terms of the heartland-hinterland relationships. TECHNIQUES OF PROJECT APPRAISAL,
Chicago Univ., Ill.
Arnold Harberger.
In: National Economic Planning, New York, Columbia University Press, p 131-149, 1967.

Descriptors: *Decision-making, Risk, Cost-benefit analysis, Marginal productivity, Discount rate, Demand function.
Identifiers: *Project appraisal, *Shadow prices, Time path, Capital market, New benefit, Externalities, Opportunity cost.

The effect of uncertainty on project appraisals is considered. In particular, the focus is primarily on the implications of changes in the discount rate for decision-making and cost-benefit analysis. The author rejects the argument that private investors excessively discount the future on grounds of risk. He recommends the observed past average social rate of return to capital as the best approximation of the discount rate for cost-benefit analysis. This advice is based on the assumption that relevant long term future rate of discount can be assumed constant and near the historical average, a finding useful for decision-makers. When market prices do not reflect the scarcity value of inputs, shadow prices are used. The use of a shadow price below the market price results in a much higher shadow rate of return to capital than the market rate and hence excessively high discount rates for future projects. The author cautions against the use of low or near zero shadow prices to avoid this problem.

his article provides a comprehensive discussion of iscount rate issues in public investment projects nd should prove valuable to water investment stuies. (Siegenthaler-Rutgers)

HE PLANNING PROGRAMMING-BUDGET-NG APPROACH TO GOVERNMENT DECI-ION-MAKING,
attelle Memorial Inst., Columbus, Ohio.
arold A. Hovey.
ew York, Frederick A. Praeger, 1968. 264 p.

escriptors: *Decision-making, *Cost-benefit alysis, Program budgeting, Resource allocation, conomic efficiency, Constraint, Marginal cost, Interest rate.
entifiers: *Planning-Programming-Budgeting, System cost, Opportunity cost, Cost-effectiveness, xternalities, Subsidies, Income redistribution, onsumer surplus, User charge, Shadow pricing.

his book presents the basic elements of the anning-Programming-Budgeting (PPB) approach decision-making. Under the PPB approach, both e budget and the program can be organized on e basis of program categories reflecting valued tputs of government programs permitting decion-makers to consider all costs in relation to the rpose pursued by government. The author scusses the identification of program goals, cost easurement, cost-effectiveness and cost-benefit alysis. Examples were presented to show that PB can expose important issues and thereby imove information available to the political decion-maker. The problems connected with PPB of th a conceptual and operational nature were scussed. The author concludes that if PPB is supted and implemented by Congress and Administors, it will be possible to effect major improveents in government planning and budgeting. The ok is relevant for water resource planners conned with program budgeting and the economic aluation of both existing and planned projects. iegenthaler-Rutgers)

CONOMIC ANALYSIS OF PUBLIC INVEST-ENT DECISIONS: INTEREST RATE POLICY ND DISCOUNTING ANALYSIS.
nt Committee on Economics (U.S. Congress).

arings before the Subcommittee on Economy in vernment of the Joint Economic Committee, netieth Congress, July 30, 31, and August 1, 68. Washington, U. S. Government Printing Ofe, 1968. 193 p.

scriptors: *Discount rate, *Interest rate, *Decin making, Cost-benefit analysis, Economic effincy, Risk, Uncertainty, Economic evaluation, lation, Resource allocation.
ntifiers: *Public investment, *Social rate of inest, Capital rationing, Capital market, Two-part cing, Opportunity cost.

e objective of these hearings was to consider the nomic evaluation of public investment and to ablish a conceptual framework for Government erest rate policy. On the basis of this concept, committee desired to establish an accurate asure of the interest rate to be used for governnt projects. Witnesses from Government agens and academia provided testimony on this subt. Government discounting practices were deterned to be neither consistent nor appropriate. en imperfect capital markets, a range of conts were offered as the appropriate public count rate including the social rate of time ference, the cost to the Treasury of borrowing, opportunity cost of displaced spending meaed by the opportunity cost of return on investnt or tax-financed investment. The sub-committ recommended that no public investment be med efficient or economic if it fails to yield erall benefits as large as the same resources in private sector. The Committee, furthermore, stressed the need for research on the opportunity cost of private spending displaced by Government investment. The cost of the noneconomic impact of public spending must be recognized as well in order that accurate evaluation of the real national economic impact can be made. This study is important for water planners concerned with the economic evaluation process of investment decisions. (See also W71-03650 thru W71-03651) (Siegenthaler-Rutgers)
W71-03649

INTEREST RATE POLICY FOR THE EVALUATION OF FEDERAL PROGRAMS,
Harvard Univ., Cambridge, Mass.
Otto Eckstein.
In: Economic Analysis of Public Investment Decisions: Interest Rate Policy and Discounting Analysis, Hearings of the Joint Economic Committee, July 30, 31, and August 1, 1968, Washington, Government Printing Office, p 50-56, 1968.

Descriptors: *Interest rate, *Economic efficiency, Economic evaluation, Investment decision, Risk, Cost-benefit analysis.
Identifiers: *Capital market, *Rate of return, Capital intensity, Liquidity, Social rate of time preference.

Interest rate policy for decision-making in the public sector is discussed. Interest rates which are below optimal levels result in excessive capital intensity and scale of development. With imperfect capital markets, the author considers the social rate of time preference and the opportunity cost of public capital as means of solving the interest rate problem in the public sector. A theoretical solution to the problem is given by first applying the social time preference rate of interest on project valuation, and then computing the cost-benefit ratio of foregone opportunities in the public and private sector. Projects are undertaken that have a cost-benefit ratio greater than the ratio of foregone opportunities. This method is difficult to apply since there is no accepted empirical definition of social time preference. The author feels a correct method is to use an opportunity cost estimate based on tax financing which results in a higher interest rate than a borrowing concept and is more realistic vis-a-vis the capital market. This article is important for water studies involved with the efficient utilization of government water investment expenditures. (See also W71-03649) (Siegenthaler-Rutgers)

CONTRAST BETWEEN WELFARE CONDITIONS FOR JOINT SUPPLY AND FOR PUBLIC GOODS,
Massachusetts Inst. of Tech., Cambridge.
Paul A. Samuelson.
Review of Economics and Statistics Vol 51, No 1, p 26-30, February 1969.

Descriptors: *Welfare economics, *Social aspects, Economic efficiency, Government, Optimization, Decision making, Marginal cost, Demand, Mathematical study, Costs, Economic evaluation.
Identifiers: *Public goods, Marginal utility, Production functions.

The author feels that for joint products, as the number of persons on both sides of the market increases, there is convergence in the usual fashion to the conditions of perfect competition. However, when the number of persons is increased in the case of a typical public good the problem becomes more indeterminate. The author attempts to provide a statement in terms of modern welfare economics of the various optimality conditions as they appear in the case of joint products. Certain aspects of water resources are commonly classified as a public good and analyzed as a good in joint supply. The paper shows that if the production functions satisfy the strict returns conditions conducive to perfect competition, the market place will determine the optimal resource allocation. Thus, the author concludes, there are real demand functions involved in standard joint products. The conclusion represents an intrinsic contrast to the public good case. The general theoretical public good arguments of this paper together with the use of flood control examples makes this article relevant to the water research area. (Murphy-Rutgers)

NATIONAL ECONOMIC PLANNING,
Massachusetts Inst. of Tech., Cambridge.
Max F. Millikan.
New York, Columbia University Press, 1967. 413 p.

Descriptors: *Economic planning, Resource allocation, Economic evaluation, Optimization, Input-output-analysis.
Identifiers: *Public expenditure, *Public good, Locational choice, Project appraisal, Objective function, Externalities, Sensitivity analysis.

This book is the result of a conference held on national economic planning. The focus is the analytic tools being utilized by economists in the planning process in countries at different stages of growth and degrees of centralization in decision-making. The first set of papers deal with functional problems common to planning. The second set of papers deals with the technique of planning in different countries. The functional issues considered were locational choice, techniques of project appraisal, and the planning of public expenditure. The question of whether planning models are useful to decision-makers was considered. The problems of restrictive assumptions, inadequacy of data, and multiplicity of goals were stressed. This book is relevant for water resource planners concerned with the economic evaluation of particular projects and the relationship to the overall government planning role. (Siegenthaler-Rutgers)

THE INTEGRATION OF EQUITY AND EFFICIENCY CRITERIA IN PUBLIC PROJECT SELECTION,
Maryland Univ., College Park; and Urban Inst., Washington, D.C.
Martin C. McGuire, and Harvey A. Garn.
Economic Journal, Vol 79, No 316, p 882-893, December 1969.

Descriptors: *Economic efficiency, Cost-benefit ratio, Public project planning, Regional development, Budget constraint.
Identifiers: *Equity, Economic welfare, Welfare index, Payoff, Objective function, Marginal utility of money welfare function.

The formulation and implementation of equity and efficiency criteria in the selection of regional development projects in the United States is discussed. The authors construct and apply Bergsonian-type welfare functions in an operational context. A welfare index based on low family income, high unemployment rates and economic distress is constructed for use of the Economic Development Administration in project selection. This leads to a decision rule to evaluate all projects by weighting benefit-cost ratios by a welfare index. Following Eckstein, projects can be selected by maximizing the sum of the scores on the index subject to budget constraints. This method assists a program administrator by providing an operational project selection system flexible enough to allow for variation in project quality and for the tradeoff between efficiency and equity. This paper is relevant for water studies involved in the investment decision making process and project evaluation. (Siegenthaler-Rutgers)

INFORMED JUDGMENT, RIGOROUS THEORY AND PUBLIC POLICY,
Princeton Univ., N.J.
William J. Baumol.
Southern Economic Journal, Vol 32, No 2, p 137-145, October 1965.

Descriptors: *Welfare economics, *Decision-making, Probability, Economic growth, Costs, Marginal cost pricing.
Identifiers: Second-best theorem, Externalities, Optimality, Social welfare function, Subsidy, Pareto criteria, Net benefit.

The impact of the second-best theorem and externality theory on policy making is considered. The second-best theorem states that in a situation characterized by a deviation from perfect optimality, partial policy measures attempting to eliminate some of the deviation may result in a new decrease in social welfare. The impact of the theorem for public policy-making is considerable. For example, corrective policies attempting the application of marginal cost pricing might lead to reduction in social welfare. With respect to externalities, theory states activities resulting in external benefits will, without regulation, fall below the ideal level. Accordingly, public policy must expand these activities by subsidy but limit activities characterized by external costs. Recently, extensions of this theory indicate that a social welfare function with multiple maxima may exist as a result of externalities. This article indicates that it is still possible to achieve improvements in social welfare through the original externality theory. This article provides a general theoretical background to water research efforts involving issues of externalities and pricing policies. (Siegenthaler-Rutgers)

THE STATUS OF PPB IN FEDERAL AGENCIES: A COMPARATIVE PERSPECTIVE,
General Accounting Office, Washington, D.C.; and Bureau of the Budget, Washington, D.C.
Keith E. Marvin, and Andrew M. Rouse.
In: The Analysis and Evaluation of Public Expenditures: the PPB System, a compendium of papers submitted to the Subcommittee on Economy in Government of the Joint Economic Committee, U.S. Government Printing Office, Washington, D.C., Vol 3, p 801-814, 1969.

Descriptors: *Planning, *Budgeting, *Programing, *Economic evaluation, Forecasting, Systems analysis, Decisionmaking, Management, Government, Training.
Identifiers: *PPB, Federal agencies, Congressional attitude, Personnel qualification, Organizational pattern, PPB analysis.

This paper describes the current status of Planning, Programing and Budgeting, (PPB), in the Federal agencies and the facts which appear to account for the different degrees of effectiveness in its application. The article is based on recent surveys of PPB systems which looked at the way in which they had been developed from the point of view of agency management. The paper is of particular interest to the water researcher, not only for its description of the PPB process, but also for its isolation of those conditions which are most conducive to the development of an effective PPB system. The authors first describe what the original expectations for the PPB system were and what was actually created. Thirteen factors which appear in each agency that has made substantial progress toward the development of PPB systems for policy decisionmaking are isolated. (See also W70-08721) (Murphy-Rutgers)

RESCUING POLICY ANALYSIS FROM PPBS,
California Univ., Berkeley.
Aaron Wildavsky.
In: The Analysis and Evaluation of Public Expenditures: the PPB System, a Compendium of papers submitted to the Subcommittee on Economy in Government of the Joint Economic Committee, U.S. Government Printing Office, Washington, D.C., Vol III, p 835-864, 1969.

Descriptors: *Systems analysis, *Economic evaluation, *Budgeting, *Government, Planning, Decision-making, Training, Model studies, Risks, Programs, Federal budgets, Economic justification, Management, Demand, Supply.
Identifiers: *PPB system, Inertia defense analysis.

The author feels that, despite the increasing necessity for policy analysis in the governmental area, the Planning-Programming-Budgeting (PPB) system is completely inappropriate to current needs. Since this has often been used in evaluating public water resource investments, the author's ideas have relevance for the water resource planner. The paper discusses the flaws in the PPB system which have caused it to fall short of expectations. PPB was a success in defense analysis because extreme cases were allowed to determine the outcome. This cannot be done in non-defense projects and it is more difficult to apply in these areas. The author feels that the emphasis on program structure, and the formal connection of policy analysis with the budget cycle, sacrifice sound analysis, initiative and imagination for pro forma structure and schedule. (See also W70-08721) (Murphy-Rutgers)
W71-03658

THE ROLE OF COST UTILITY ANALYSIS IN PROGRAM BUDGETING,
Rand Corp., Santa Monica, Calif.
Gene H. Fisher.
In: Public Budgeting and Finance, Itasca, Illinois, Peacock Publishers, p 545-560, 1968.

Descriptors: *Cost-benefit analysis, *Decision-making, Planning, Economic evaluation, Risks, Management, Utility, Time, Budgeting, Resource allocation, Economic feasibility, Optimization, Systems analysis.
Identifiers: *Cost utility analysis, Rand Corporation, Program-budgeting.

This paper provides a discussion of considerations of the analytical process in program budgeting. The objective of this type of analytical effort is to systematically examine alternative courses of action in terms of utility and cost with the purpose of clarifying the relevant choices open to the decision maker. Thus, after a brief discussion of some analytical methods and techniques used in the program budgeting process, the author explains the use of cost utility analysis, pointing out six main characteristics and presenting an example of its use. The article demonstrates that where major uncertainties are present in decisions pertaining to the initiation of development for a total system, the analysis may suggest relatively inexpensive component development programs which minimize the risk. The analysis used in this study is closely related to cost benefit analysis and an understanding of this article could be of assistance in the evaluation of water resource investments. (Murphy-Rutgers)

CALIFORNIA'S PROGRAMING AND BUDGETING SYSTEM,
California State Dept. of Finance, Sacramento.
Edwin W. Beach.
In: Innovations In Planning, Programing, and Budgeting In State and Local Governments, a compendium of papers submitted to the Subcommittee On Economy In Government of the Joint Economic Committee, U.S. Government Printing Office, Washington, D.C., p 27-35, 1969.

Descriptors: *Planning, *Budgets, *Forecasting, *Management, Government, Financing, Costs, Benefits, Economic evaluation, Decisionmaking, Systems analysis, Data collection, *California.
Identifiers: *Programing, *PPB, Multi-year programs, Agency planning.

The necessity for choosing among many alternatives forced the development of the Programing and Budgeting System. The main value of the Programing and Budgeting System is that it provides an increased capability to consider the costs and benefits of various program alternatives. This is a problem consistently faced in the water resource area so that this article, which provides a review of the structure of California's Programing and Budgeting System and the progress to date in implementing it, should be of interest to the wate researcher. In addition, the author explains th relationship of the Programing and Budgetin System to the function of planning and states that is one of the most significant improvements to th management process in a long time. (Murphy-Rugers)
W71-03660

DEVELOPMENT OF P P B SYSTEM IN TH STATE OF MICHIGAN,
Michigan State Budget Director.
Paul A. Wileden.
In: Innovation In Planning Programing An Budgeting in State And Local Governments, compendium of papers submitted to the Subcom mittee On Economy In Government of the Joi Economic Committee, U. S. Government Printin Office, Washington, D.C., p 36-47 1969.

Descriptors: *Planning, *Budgeting, *Economi evaluation, Forecasting, Systems analysis, Trainin Benefits, Costs, Resource development, Financin Social aspects, Economic analysis, Government.
Identifiers: *Michigan, *Programing, *PPB, Mu tiyear framework, Program identification.

The author explains the need to replace the earlie types of input-orientated budget decisions wit those more relevant to purpose, performance an related cost factors. The article describes th planning, programing and budgeting (PPB) proce as being ideally suited for this purpose. The stru ture and components of the PPB system in the sta of Michigan, are described in relation to the obje tive of producing an out-put orientated progra budget within a multiyear framework, based o adequate systematic analysis of alternatives, an reflecting pertinent costs in relation to results. Th current stage of PPB development is discussed an the need stressed for greater personnel trainin The decisions that the state is forced to make a similar to those in the public water resources are The article appraises the PPB system as enabling more rational determination of the relevant prior ties in allocating scarce public resources, throug systematic analysis and evaluation of progra productivity in response to social needs. Thus, th use of this system may enable a better use of scarc public water resources. (Murphy-Rutgers)
W71-03661

P P B S IN CITY, STATE AND COUNTY: A OVERVIEW,
Selma J. Mushkin.
In: Innovations In Planning, Programing, an Budgeting In State and Local Governments, a com pendium of papers submitted to the Subcommitte on Economy In Government of the Joint Economi Committee, U.S. Government Printing Offic Washington, D.C., p 1-14 1969.

Descriptors: *Economic evaluation, *Planning Budgeting, *Decision-making, *Governmen Costs, Benefits, Forecasting, Optimization, Trai ing, Model studies, Economic efficiency, Resourc allocation.
Identifiers: *PPB, *Programing, 5-5-5 project.

In this paper the author describes the applicatio of planning, programing and budgeting (PP systems in the state and local governments as we as the results of the application of these system The PPB system has proven to be a method economic evaluation particularly suited to th water resource area. Thus, this article should pro of interest to those concerned with public wat resource investments. The author describes two a proaches to PPB systems application which sh labels as the incremental approach and the syst matic approach. They are evaluated in terms their effectiveness in forcing more rational publ decisions on the allocation of scarce resources an improved comparison of the cost and effectivene of program options. The results of a number of pr jects are analyzed, with emphasis on the problen involved and the lessons learned. The auth

esents those changes she thinks are necessary for more effective use of P P B systems. The paper ncludes with a list of the outputs of present appli-ations of PPB. (Murphy-Rutgers)

ER RESPONSE IN OUTDOOR RECREA-ON: A COMMENT,
rnell Univ., Ithaca, N. Y.
is E. Gosse, and Robert E. Kalter.
urnal of Leisure Research, Vol 2, No 2, p 131-4, Spring 1970.

escriptors: *Recreation, *Resource allocation, emand, Supply, Investment, Forecasting.
entifiers: *User response, Production function, pacity, Travel costs, Consumer surplus, Identifi-tion problem, Marginal rate of substitution.

e author considers the article: 'User Response in tdoor Recreation: A Production Analysis' (JLR: mmer 1969) by Senaca and Ciccheti. The oduction function for recreational sites in-oduced in the article is based on recreational use d not site capacity. Kalter and Gosse question e assumption that the total recreation consumed identical to the total output or capacity of the rk. With the recreation market implied, the pply of recreational facilities is so restricted that y given increase in supply would still result in a oportional increase in use or excess demand uld exist. However, the user response equation es not consider the possibility that the location of w facilities can influence the amount of new creational use. For policy making, a measure of e value of the potential recreational site to ciety is necessary in addition to the relation tween recreation use and supply yielded by the er response model. The value measure can be und by approximating the consumer surplus for e associated demand function. However, the user sponse model is an important aid for recreation anners. (Siegenthaler-Rutgers)

AN ECONOMIC EVALUATION OF CONNECTICUT WATER LAW: WATER RIGHTS, PUBLIC WATER SUPPLY AND POLLUTION CONTROL,
Connecticut Univ., Storrs. Inst. of Water Resources.
Robert L. Leonard.
Available from NTIS as PB-196 898, $3.00 in paper copy, $0.95 in microfiche. Institute of Water Resources, Univ of Connecticut, Report No 11, July 1970. 67 p, 5 tab, 136 ref, 2 append. OWRR Project A-012-CONN (5).

Descriptors: *Connecticut, *Economic efficiency, *Water law, *Economic feasibility, Economics, Legal aspects, Water resources, Economic impact, Economic justification, Pollution abatement, Water quality control, Riparian rights, Cost-benefit analysis, Water supply, Streamflow, Regulated flow, Consumptive uses, Groundwater, Condemnation, Compensation, Administrative decisions, Recreation demand, Public rights, Grants, Legislation.

Utilizing economic criteria, this report analyzes Connecticut's water law system. The author employs as evaluatory tools cost-benefit analysis and the degree of economic flexibility afforded by water rights and regulations. Competing property rights, economic models, public policies and programs, and research incentives are interrelated with economic costs. Recommendations are made in four areas: (1) public water supplies, (2) water rights, (3) stream flow and groundwater management, and (4) pollution control. The effect of the non-riparian status of Connecticut's public water supplies is considered in light of condemnation powers, compensation requirements, and legislative restrictions. Locational advantages, common-law pollution protection, efficiency in allocating among consumptive uses, and the ineffectiveness of riparian doctrines in protecting recreational and environmental values are all discussed as they relate to suggested improvements in Connecticut's existing water law system. Stream flow and groundwater management are examined in terms of the authority needed for governmental management, stream flow objectives, administrative problems, and the impact on water users. The lack of economic incentives for pollution abatement, water-quality criteria, financial assistance, and the exercise of regulatory powers are considered in analyzing pollution and water quality control. (Earl-Florida)

A REGIONAL WATER RESOURCE MANAGEMENT PLAN FOR DANE COUNTY.
Bauer, Sheaffer, and McCall, Inc., Chicago, Ill.

Dane County, Michigan, Regional Planning Commission, 1970. 166 p, 23 fig, 13 tab, 2 append.

Descriptors: *Plan, *Regional analysis, *Water resources, *Sprinker irrigation, *Waste water treatment, *Waste management, Flow, Diversion, Groundwater basins, Water pollution, Eutrophication, Evaluation, Drainage.
Identifiers: *Goals, Agriculture drainage, Urban drainage, Madison metropolitan area, Stoughton area, Upper yahara river basin.

The report attempts to develop a conceptual plan for the total management of water resources, including both surface and groundwater. The key elements of the plan are two spray irrigation-waste water treatment facilities, one for the Madison Metropolitan Area and one for the Stoughton Area. The former would serve to discontinue the diversion of effluent and would return ti to the Upper Yahara Basin where more water flow, because of diversion, is needed. The plan includes a water supply element where repositioning of groundwater wells near groundwater basin perimeters would reduce potential groundwater contamination and increase the size of the groundwater basin. Also, a drainage element considers both urban drainage and rural-agricultural drainage and the possible management opportunities. (Miller-Chicago)
W71-03760

A PROGRESS REPORT ON THE FUTURE OF CHICAGO'S LAKEFRONT.
Johnson, Johnson and Roy, Inc., Ann Arbor, Mich.

Preliminary Report, February 1968. 52 p.

Descriptors: *Lake Michigan, *City planning, *Planning, *Resource development, *Parks, *Land use, Lake shores, Lakes, Aesthetics, Recreation, Recreation facilities, Management.
Identifiers: *Chicago, *Lakefront development.

A number of basic study objectives which characterize the report can be identified: (a) to reconfirm the manner in which the lakeshore has served the people of Chicago in the past; (b) to discover how the lakeshore is most effectively used today; (c) to discover the best possible use of the lakeshore as a recreation resource; (d) to chart the potentials for increased recreation land areas along the shore or off shore; (e) to match future potentials for use with appropriate access patterns; (f) to recommend basic action programs which would lead towards the full measure of future potential inherent in the lakeshore; and (g) to establish basic principles of shoreline development which can be directly beneficial to numerous and otherwise unrelated public and private developments along the shore. ECONOMICS AND ECOLOGY,
Michigan Univ., Ann Arbor. Dept. of Economics.
Kenneth E. Boulding.
In: Future Environments of North America, ed. Darling, F. Fraser and Milton, John P. (The Natural Press: Garden City, New York, 1966) p 225-234. 1 ref.

Descriptors: *Economics, *Ecology, Equilibrium, Ethics.
Identifiers: Policy, Individuals, Species, Exchange systems, Closed systems, Resources.

While there has been little interaction between the sciences of economics and ecology, there are striking parallels between the two. Five basic similarities are outlined. First, both study not only individuals as such but individuals as members of species. Second, both have an important concept of general equilibrium, one dealing with population, the other with the price system. Third, both involve a system of exchange among their various individuals and species as an essential element in determining their final equilibrium, in one symbolized by the price system, in the other by the metabolic system. Fourth, both imply some concept of development. And fifth, important parallels fall under the general head of policy, i.e., the distortion of the system equilibrium in favor of man. The fact that we distort the ecosystem in favor of man does not mean that we destroy the principles of general equilibrium of populations. The author contends that the failure of most social policies is a result of man not cooperating with the ecological forces determining population equilibrium. In spite of the similarities there are important differences. Economists are irretrievably man-centered; no ecological concept corresponds to the economists' gross national product. The ecologists value system encompasses all species, and this difference involves deep ethical problems, among them species' extinction. However, man's speeding up of the evolutionary process puts up Dead End signs for the ecologist and Thin Ice signs for the economist. Finally, the author discusses the implications that result from looking at resources as infinite and looking at them in terms of a closed system. (Preckwinkle-Chicago)

STANDARDS AND TECHNIQUES OF EVALUATING ECONOMIC CHOICES IN ENVIRONMENTAL RESOURCE DEVELOPMENT,
Michigan Univ., Ann Arbor. School of Natural Resources.
Ayers Brinser.
In: Future Environments of North America, ed. Darling, F. Fraser and Milton, John P. (The Natural History Press: Garden City, New York, 1966), p 235-245. 27 ref.

Descriptors: *Economics, *Methodology, Investment, Conservation.
Identifiers: *Economic choice, *Environmental resource development, *Environmental quality, Comprehensive planning, Incremental planning, Criteria.

The author begins by defining terms. Economic choice is an attempt to state 'who should pay how much for what' and environmental resource development is equivalent to economic welfare with a major objective the enhancement of the quality of living. However, it is not clear that economics as defined by many practicing economists is a proper instrument for evaluating decisions about investment in environmental development. At present, it is argued, we are still in a period of trying to create methodologies. Concepts on which those methods are based are not resolving issues. The problem of evaluating economic choices remains in general terms to find measurements that will show how much more or how much less. It is unlikely that with present techniques such criteria could be embodied in a comprehensive plan. We lack the necessary tools for discovering either individual and social time preferences or for finding their proper relationship. The same problem of relationship holds for private and public finds invested in improving the quality of the environment. Comprehensive design with incremental planning may provide for more effective development. The criteria selected for alternative investment opportunities should be designed to promote growth and development. Rather than aiming at preserving what is or restoring the past, they should be concerned with improving the quality of choices that will come in the future. Again, incremental planning appears necessary. The major purpose of criteria must include increasing opportunities for external economics flowing from public as well as private investment with the choice of criteria not confined by an overwhelming concern for scarcity. EVALUATION OF RECREATION AND AESTHETIC USES OF WATER IN AN URBAN SETTING,
Chicago Univ., Ill.
Orville F. Grimes.
Paper, Urban Economics Workshop, University of Chicago, 27 February 1970. 28 p, 6 fig, 2 tab, 16 ref.

Descriptors: *Evaluation, *Aesthetics, *Cities, *Recreation, *Economic impact, Planning, Urbanization, Water resources, Recreation demand, Recreation facilities, Benefits, Value, Shores.
Identifiers: *Urban areas, *Recreational uses, *Aesthetic uses, Value of views, Urban environment.

The structure of the demand for water-oriented outdoor recreation activities is examined. Also explored are the ways in which this demand is effected by concentrations of people in urban areas, characteristics of urban people, and the urban environment. Various categories of urban recreation benefits are specified: (a) public recreational use of shoreline inside or outside the city; (b) value of views of the water area to residents along the shoreline; (c) value of views of the water are to non-residents; and (d) private recreational use of shoreline inside or outside the city by city residents. Hypotheses regarding the relative importance of these benefits are examined. A category of benefits is selected for empirical analysis and some preliminary analysis, and some preliminary findings are presented. (Davis-Chicago)

WATER RESOURCES AND LAND USE OF THE PYRAMID LAKE INDIAN RESERVATION.
Wilsey and Ham, San Mateo, Calif.

Available from NTIS as PB-195 088, $3.00 in paper copy, $0.95 in microfiche. Final report to Economic Development Administration, EDACOMM-70-012, Oct 1970. 187 p, 13 tab, 15 fig, 44 ref.
Identifiers: *Water resources, *Nevada, *Economic development, Lakes, Employment, Land use, Stabilization, Irrigation, Electric power generation, Pyramid Lake, Pyramid Paiute Indian Reservation, Tourism, *Indian reservations, Technical assistance projects.

Data are presented and recommendations made for establishment of a permanent employment and income base for the Pyramid Paiute Indian Reservation in Nevada. Findings indicate public and private investment in the area have been inhibited because of uncertainty potable water supply, general land use planning, and the shrinking of the lake through diversion of the Truckee River. Restoration of river flows to stabilize the lake, and protection and enhancement of the lake to develop tourism are described as political and legal considerations. Economic value of water used to supplement flows in Pyramid Lake is discussed in terms of irrigation and operation of a power plant. Need for a general land use plan is described in terms of agriculture, town needs, conservation, and recreation and tourism.

SUMMARY OF EVALUATION PROCESSES IN WATER RESOURCES PLANNING,
Rutgers - The State Univ., New Brunswick, N.J. Water Resources Research Inst.
William Whipple, Jr.
Water Resources Bulletin, Vol 6, No 4, AWRA News, An AWRA Research Conference, Univ of Wisconsin - Milwaukee, June 14-19, 1970, p 700-703, July-Aug 1970. 4 p.

Descriptors: *Evaluation, *Planning, *Water resources, *Conferences, Optimization, Computers, Water quality control, Flood plains, Interest rate, Discount rate, Regional analysis.
Identifiers: Multiple objective functions.

A summary of the AWRA Conference, 'Evaluation Processes in Water Resources Planning', was given. Certain developments of general interest were summarized. First, the Conference reached a concensus that computer-based systems analysis is an essential part of the planning process which has not yet been fully utilized, and which has further capabilities particularly in the outlining of alternatives. However, opinions were expressed that, emphasis must be shifted to improve data and inputs, rather than approaches. It was thought that there is a need for expanded research in the nation-wide system of standards for water quality control established by the Federal Government. There was a discussion of benefits of environmental quality where it is extremely difficult to evaluate environmental objectives. Three alternative approaches to a system of planning based upon multiple objective functions were suggested at the Conference. It was explored in connection with the subject of metropolitan area planning. A session held on flood plain management excluded the matter of optimization of investment in flood control and flood plain zoning. Interest, discount rates, and regional benefits were discussed as well as political and institutional problems. The final session dealt with recommendations of a research program to improve the evaluation process. (Kriss-Cornell)

FACTORS INFLUENCING RURAL WATE PURCHASE,
Kentucky Water Resources Inst., Lexington.
Charles R. Rosenstiel.
Available from NTIS as PB-196 658, $3.00 paper copy, $0.95 in microfiche. Technical repo Kentucky Water Resources Institute Research R port No 38, 1970. 45 p, 8 tab, 7 ref, 2 appen OWRR Project A-022-KY (9).

Descriptors: *Social change, Social values, Soci impact, Attitudes, Kentucky, Costs, *Water use *Water utilization, Water rates, *Water cos Prices.
Identifiers: Water purchase, Water needs.

An analysis is presented of factors which influen domestic water purchase among residents of a ru Kentucky county who must purchase hauled wat The results of the analysis are compared with pre ous studies of factors which influence domes water use by urban dwellers participating in a pip water distribution system. The results of the anal sis of rural water purchase corroborates t findings from the studies of urban water use, sho ing that the amount of water purchased by household is influenced by the socio-econom status of that household and by the price paid f water. As socio-economic status rises, domes water purchase increases, and as the price of wat increases the amount of water purchas decreases.

ON THE INCIDENCE OF INCOME REDI TRIBUTION,
Iowa State Univ., Ames.
J. Ronnie Davis.
Public Choice, Vol 8, No 2, p 63-74, Spring 1970

Descriptors: *Welfare economics, Decision ma ing, Stability.
Identifiers: *Income redistribution, *Incidenc Game theory, Net payoff, Characteristic functi Marginal product.

The incidence of income redistribution is co sidered as a function of voting or fiscal decisi making rules. Three general fiscal institutions a investigated to determine the relationship betwe fiscal decision making institutions and redistrib tion. They are the democratic fiscal institutio which allow all members one vote each, taxpay fiscal institutions allowing only taxpayers a vo and proportional taxpayers fiscal institutions whe votes are in proportion to the amount of taxes pa Game theory is used to discuss the implications f income redistribution within the three institutio rules. The results indicate that only the democra rule can rely on individual voting to distribute come downward. The taxpayer and proportio rules redistribute in an inconsistent manner w the proportional rule generally redistributing come upward. The author concludes that in l than unanimous decision-making, some conce must be given to the incidence of income red tribution. There have been recent studies deali with the distributional effects of water investme

ects. This study provides a general framework nalyze the distributional aspects of government and investment policies. (Siegenthaler-Rutgers) 1-03600

URTHER NOTE ON THE COST IMPLICA-NS OF FLUCTUATING DEMAND,
ling Green State Univ., Ohio; and Rutgers - State Univ., New Brunswick, N.J.
y V. Smith, and Joseph J. Seneca.
nal of Financial and QUANITATIVE Analysis, 5, No 3, p 369-376, September 1970.

criptors: *Flexibility, *Demand function, ability, Cost function, Inventory, Constraint.
tifiers: *User costs, Production function, or series.

effect of fluctuating demand is discussed for a uct on factor input level and production cost e firm. Recent work by McKean has asserted in order to estimate the cost of production of a uct subject to fluctuations in demand, one consider the entire distribution of outputs with the static cost function. This paper nsiders this problem in the context of flexibili-'lexibility is present when the entrepreneur tains a range of factor inputs and minimizes cost of output over the relevant part of the uction function. In markets with variations in nd, the firm produces a probability distribu-of outputs and minimizes a total cost function iated with the production of that probability bution. The article shows that the static cost ion and the variable output cost function are dentical with the same input mix. Accordingly, se of the static cost function for firms with bility in demand will overstate the total cost of and superoptimum outputs and also distort ge cost. The concept of flexibility is relevant anning water supplies designed to meet wide tions in the demand for water use. enthaler-Rutgers)

PROBLEMS IN PUBLIC EXPENDITURE ANALYSIS,
Brookings Institution, Washington, D.C.
Samuel B. Chase.
Washington, D.C., the Brookings Institution, 1968. 269 p.

Descriptors: *Government, *Benefit-cost analysis, *Economic evaluation, Prices, Income, Time, Transportation, Social aspects, Economic efficiency, Government supports, Recreation, Taxes, Planning, Pollution.
Identifiers: Public expenditure analysis, *Income distribution, *Shadow prices, Travel time, Mortality, Cotton prices.

The book contains five papers and ten commentaries resulting from a conference on the problems of government expenditure analysis in September 1966. The first paper considers the difficulities of evaluating benefits and costs, particularly when private market prices cannot be used directly. The next two papers deal with the problems of valuing the savings of human time and human life. The value of time differs not only among persons and over each person's life span, but also among different uses and hours of the day. To determine the values put on reduced risk the author recommends the intensive interview technique to determine what the individual would be willing to pay for specified reductions in mortality probabilities. The next paper deals with the problem of income distribution effects and benefit cost analysis. It is shown that distributive effects must be considered along with traditional efficiency measures of expenditure programs and two methods for their inclusion are presented. The last paper discusses the distribution of benefits from cotton price supports. The discussions of these papers should aid in evaluating government water resources expenditures. In addition, the specific applicability of a number of papers to the evaluation of water supply and recreation benefits should provide specific interest to the water researcher. INCOME REDISTRIBUTION EFFECTS AND BENEFIT-COST ANALYSIS,
Wisconsin Univ., Madison.
Burton A. Weisbrod.
In: Problems in Public Expenditure Analysis, Washington, D.C., the Brookings Institution, 1968, p 177-209.

Descriptors: *Income, *Cost-benefit analysis, *Economic efficiency, *Decision-making, Government, Economic evaluation, Optimization, Welfare economics, Population, Recreation, Model studies, Water resource development.
Identifiers: *Income distribution, *Allocative efficiency, Distributional criteria, Weights.

This paper attempts to find a means by which economists can improve the quality of decisions on public expenditures through incorporation of the income distribution effects as well as the allocative-efficiency effects into the benefit-cost analysis of public projects. One device would be to determine how the total benefits and costs of each project would be divided among various population groupings. A second method would be to deduce the value judgements concerning the distribution of income which is implied by decision choices and then assign weights to the distributional effects. The author argues that consideration of the income distribution effects of public investments will improve the quality of advice provided by economic analysis. The paper discusses these in the context of several water resource projects, and the author shows that their specific inclusion in the economic evaluation could improve the decision-making process. THE SECOND-BEST CASE FOR MARGINAL COST PRICING,
Electricity Council, London (England).
R. Turvey.
In: Public Economics, London, Macmillan, 1969, p 336-343.

Descriptors: *Marginal cost pricing, *Resource allocation, Economic efficiency, Interest rate, Investment decision, Depreciation.
Identifiers: *Public enterprise, *Social cost, Social discount rate, Capital rationing, *Second-best case, Shadow pricing, Capital intensity, Book value.

Economic efficiency and the conditions for efficient resource allocation for public enterprises are discussed. The optimum conditions for economic efficiency occur when all prices are equal to the long run marginal cost of goods and services and when the interest rate used in decision-making is uniform throughout the economy and equal to the social discount rate. The problem of the second-best or sub-optimization for the public enterprise sector is analyzed. The marginal cost pricing rule is not applicable and therefore new rules are worked out to achieve sub-optimization. These rules are concerned with the following issues: the choice of inputs by a public enterprise of how to produce a set of outputs, and the determination of the relative prices of the outputs. For the first problem, the conclusion is that public enterprises should minimize costs calculated with market prices of inputs and corrected for divergence of social cost on the second issue, the prices of public enterprise products should equal long-term marginal cost within their sector and be proportional to sales outside the sector for a group of substitutes. This article is relevant for water studies concerned with the theoretical foundations of pricing problems in the public goods area. (See also W71-03616) (Siegenthaler-Rutgers)

POLITICAL AND BUDGETARY CONSTRAINTS: SOME CHARACTERISTICS AND IMPLICATIONS,
Ministry of Aviation, London (England).
P. D. Henderson.
In: Public Economics, London, Macmillan, 1969, p 310-325.

Descriptors: *Political constraint, *Budgetary constraint, Economic efficiency, Cost, Risk, Welfare economics, Systems analysis.
Identifiers: *Second-best rules, Decision rules, Economic growth, Shadow pricing.

Political and budgetary constraints are discussed in relation to other aspects of the public economy and to a wide range of policy issues. For economic efficiency and consistency, the choice of objective and the form of the constraints should be determined at high political levels to avoid piecemeal decisions. Flood control in the United States is cited as a violation of this principle. Constraints should be formalized and made explicit to aid in quantifying the implications of alternative policies in order to ensure their role in the decision-making process. The author suggests two methods of ensuring that political and budgeting constraints on expenditures programs are well designed. Within individual programs, the use of program budgeting and systems analysis is important. With respect to choice of programs, objective discussion without excessive political interference of expenditure allocation should occur. The article is important to water investment studies concerned with the political constraints to public decision making. (See also W71-03616) (Siegenthaler-Rutgers)

PURE THEORY OF PUBLIC EXPENDITURE AND TAXATION,
Massachusetts Inst. of Tech., Cambridge.
Paul A. Samuelson.
In: Public Economics, London, Macmillan, 1969, p 98-123.

Descriptors: *Public expenditure, Taxation, Resource allocation, Social welfare, Welfare economics.
Identifiers: *Public good, *Benefit theory, Ability-to-pay, Consumption externality, Game theory, Consumer surplus, Marginal utility of money, Pareto optimal, Algorithm.

The theory of optimal resource allocation of public and social goods is related to previous public finance writing. A public good is defined as one with the property of a consumption externality (that is, entering into two or more person's preference function simultaneously). Under this definition, there are pure private goods where the market mechanism operates and the whole field of public goods. A pseudo-demand analysis is presented for public and private goods with utility maximized subject to a state provided lump sum income. It is found that pseudo-laissez-faire does lead to Pareto optimality but not ethically maximum welfare. The tax theory relying on voluntarism is found to be false. It was impossible to separate benefit-allocation and redistribution-equity considerations. The author cites a need for analytical studies of public goods using algorithmic solutions immune to bilateral monopoly or game theoretic objections. The article is relevant to theoretical studies of the public good nature of water resource projects. (See also W71-03616) (Siegenthaler-Rutgers)

THE DISTRIBUTION OF THE BURDEN OF SEWER USER CHARGES UNDER VARIOUS CHARGE FORMULAS,
McMaster Univ., Hamilton (Ontario).
James A. Johnson.
The National Tax Journal, Vol XXIX, No 3, p 472-485, December 1969.

Descriptors: *Cost sharing, Economic efficiency, Resource allocation, Marginal costs, Revenue, Regressivity.
Identifiers: *User charge, *Sewer service charge, Burden, Equity, Externalities, Social cost, Social benefits.

This paper analyzes one type of user charge--the sewer service charge in terms of equity, resource allocation, revenue, and administrative objectives. The model divides users into residential, commercial and industrial categories. The burden for each category is then computed under ten sewer charge formulas by applying the charges to a model of a large eastern city. The measure of burden is the percentage of revenue that would be paid by categories of users under each of the sewer charges. The results indicate a large variance in the distribution of the revenue borne among the three categories of users. The residential share is highest when there is a flat or minimum fee with the commercial share being largest when the charge is based on property value. The industrial share is greatest if the charge basis is sewage strength but it is also high for a fixed rate. It is difficult to determine equity and resource allocation objectives which are satisfied in a formula. Hence, formula choice depends on the relative weights placed on the four objectives. The most efficient formulas by objective are: for equity, property assessment; for resource allocation, rate per unit of volume and strength; for revenue, all formulas, and for administration, flat fee and property assessment. (Siegenthaler-Rutgers)

POLLUTION, PROPERTY AND PRICES,
Toronto Univ., (Ontario).
J. H. Dales.
Toronto, University of Toronto Press, 1968. 111 p.

Descriptors: *Prices, *Waste disposal costs, Decision-making, Cost benefit analysis, Economic efficiency.
Identifiers: *Property rights, *Pollution costs, Net benefit, Social cost, User charge, Subsidy, Regulatory agencies.

The author considers pollution as a social problem involving collective decision-making. The costs of waste disposal are divided into pollution prevention costs and pollution costs. Cost-benefit analysis is illustrated as a method of decision-making about different pollution policies that are selected through political decision-making. The treatment of air and water as unrestricted common property is questioned with a more sophisticated approach suggested to property rights. The best strategy, the author suggests, for reducing waste disposal costs is a system of charging for user rights with the Government setting the level of permissible pollution. This book is relevant for water resource planners concerned with resource allocation. (Siegenthaler-Rutgers)

ZERO-BASE BUDGETING,
Texas Instruments, Inc., Dallas.
Peter A. Pyhrr.
Harvard Business Review, Vol 48, No 6, p 111-121, Nov-Dec 1970.

Descriptors: *Budgets, *Management, *Resource allocation, Economic evaluation, Costs, Alternatives, Benefits, Production, Planning, Decision-making.
Identifiers: *Support expense, *Zero base, Ranking, Voting, Cash flow.

Budgeting of future expenses other than those in the category of direct labor, materials and overhead expense is discussed. The budget process is described at Texas Instruments which, instead of adjusting the existing budget for the upcoming year, starts from a zero base viewing all its activities and priorities afresh and creates a new set of allocations for the upcoming budget year. The experiences of this company, as well as the budgeting principles involving cost-benefit analysis, are directly transferrable to the area of water resource budgeting. The procedure provides: (1) management with a definite means of control on support allocations of all kinds; (2) a method for describing all support expense minutely; (3) a means for classifying the alternatives to each; and (4) a method for sorting all alternatives by both importance and priority. (Murphy-Rutgers)

RATE OF RETURN ON INVESTMENT RISK,
Massachusetts Inst. of Tech., Cambridge.
Paul H. Cootner, and Daniel M. Holland.
Bell Journal of Economics and Management Science, Vol 1, No 2, p 211-226, Autumn 1970.

Descriptors: *Risk, Regression analysis, Marginal utility, Probability distribution.
Identifiers: *Rate of return, *Capital market, Book value, Risk averter, Capitalization, Skewness.

The study was undertaken to find an empirical basis for the Supreme Court ruling that a regulated utility should earn a rate of return equal to that of unregulated firms given corresponding risks. Business risk is defined as functionally related to earnings variability. The authors tested the hypothesis that there is a positive association between business risk and rate of return using regression analysis to explain the variation of industry rate of return with risk. The results are significant and indicate a positive relationship exists for both samples of companies and industries. The model explains about 30% of the variability in the rate of return among companies and industries. The results are considered in the light of recent research on financial risk. This article is of general relevance to rate of return issues involving water utilities. (Siegenthaler-Rutgers)

TERMINATION OF THE SIGNIFICANCE OF RIABLES AFFECTING RESIDENTIAL ATER CONSUMPTION,
erto Rico Univ., Mayaguez. Water Resources
search Inst.
pu Kuttan.

Available from NTIS as PB-196 873, $3.00 in paper copy, $0.95 in microfiche. Technical Completion Report, Water Resources Research Institute, Mayaguey, Puerto Rico, September, 1970. 19 p, 1 tab, 20 ref. OWRR Project A-022-PR (1).

Descriptors: *Water demands, *Water consumption, *Consumptive use, Water utilization, *Municipal water, *Water supply, Statistical methods.
Identifiers: *Residential water consumption.

The purpose of this project was to identify the significance of variables affecting residential water consumption in the case of private urbanization dwellings in Puerto Rico. Separate sections deal with a survey of variables affecting residential water consumption and response variables for residential water consumption; design of a statistical experiment; experimentation and data gathering; analysis of data; and conclusions and recommendations. It is concluded that the number of bathrooms has the largest effect on per capita water consumption in the case of private urbanization homes in Puerto Rico. This study does not indicate that property value is a significant variable as believed by many. Conclusions are limited by the fact that no variable was found to be significant statistically. It is also seen that the error variance is very large. Recommended for investigation is an approach to account for two-factor interactions, i.e., interaction effect between variables such as, number of bedrooms and number of automobiles.

WATER AND CITIES AND INDUSTRIES,
Hazen and Sawyer, New York.
Richard Hazen.
Lectures on Water Management, Water Management Seminars, Johns Hopkins University, Baltimore, Maryland, October 26, 1964, p 25-34.

Descriptors: *Industrial use, *Municipal water, Water reuse, Water works, Water rates, *Water utilization.
Identifiers: Consolidated Edison Company of New York, Upland water, Port of New York Authority, Washington Suburban Sanitary Commission.

Municipal water consumption is compared to industrial use of water. The author described in general terms the quantity of water used by each, the rates each paid and the specific ways each used the water. Also discussed was the relative advantage of upland water supplies (i.e. unpolluted supplies) to reclaimed water. The author advocated identification and exclusion of harmful substances before entrance into the water supplies rather than filtration afterwards. Included also in this brief paper was a rationale for 'overbuilding water works'-a charge which the author (himself an engineer) explains is often directed against engineers who have constructed works larger than what is immediately needed. WATER ALLOCATION IN AN URBAN FRAMEWORK,
West Virginia Univ., Morgantown.
Patrick Mann.
Nebraska Journal of Economics and Business, Vol 9, No 1, p 3-17, Winter 1970.

Descriptors: *Water supply, *Water demand, Decision making, Water resource management, Price elasticity, Watershed development, Salt water conversion.
Identifiers: *Water division, Sewage reclamation, Sewer charge.

The impact is considered of rapid urbanization in the United States on the future water supply. Large population growth has resulted in decision making aimed toward increasing regular water supplies via the alternatives of saltwater conversion, watershed development, and geographical diversion of water supply. The main issue in water supply is the necessity to compare all rational alternatives for meeting the increase in demand for water services. The relative costs of these alternatives must be considered as well as the costs of metering sewage reclamation and rate increases. The use of rate increases to ration water supply is a policy alternative which has been overlooked. The author contends that rational pricing may be more costly as an alternative than the expansion of water supplies through water diversion. Water supply and pricing must be analyzed in the larger framework of the problems of water quality and water-use management. (Siegenthaler-Rutgers)

POPULATION AND NATURAL RESOURCES,
Carnegie Institution of Washington, D.C.
Edward Ackerman.
In: Readings in Resource Management and Conservation, Chicago, University of Chicago Press, 1965, p 127-152.

Descriptors: *Population, *Natural resources, *Conservation, Technology, Economies of scale, Wastes, Irrigation, Evaporation, Water supply, Budgets, Sea water, Precipitation, Management, Water quality.
Identifiers: *Malthus, *Manufacturing, Productive life, Culture, Resource stability, Consumption.

This author studies the relationship between demography and resources through the use of an equation relating the demand and supply of natural resources. The article involves an extended discussion of the variables to be included in this equation. Correlation between population and the physical environment, geographical incidence of certain cultural factors, effects of institutional inheritance and the stability and quality of the resources are some of the topics treated. In addition certain 'feedback' items are discussed and all resource and culture attributes are studied as they correlate with demographic attributes other than number. Finally, all of the analysis is applied to a study of the world's population. In the concluding section on neo-Malthusian and anti-Malthusian views, two different prospects for resource adequacy are projected for the next decade, these being those for China-type countries and those for European-type countries. Co-ordinated population-resource-technology studies are suggested to deal with the problems of these two types of countries for the purpose of arriving at an understanding of what the limits of the earth may amount to in the immediate future. Many of the problems in the water resource area are common to all natural resources. Thus, this article should be of use to the water planner. (See also W71-03631) (Murphy-Rutgers)

SIMPSON V MARTIN (TITLE DISPUTE TO RIPARIAN LAND DEPENDS ON WHETHER RIVER CHANGED COURSE BY ACCRETION OR AVULSION).

298 SW 861-863 (Ark 1927).

Descriptors: *Arkansas, *Boundaries (Property), *Avulsion, *Riparian land, Riparian waters, Riparian rights, Rivers, Navigable rivers, Bank erosion, Accretion (Legal aspects), Channel erosion, Prescriptive rights, Land tenure, Real property, Legal aspects, Judicial decisions, Adjudication procedure.

Plaintiff riparian owner sued defendant riparian owner to quiet title to river front property. The record title showed that plaintiff's land was north of the river and defendant's land was south of the river. Plaintiff contended that the river had gradually moved south, the south bank being gradually washed away and the north bank moving south by accretions to plaintiff's land until the accretions to his land occupied what used to be defendant's land south of the river. Plaintiff also claimed adverse possession of the lands in question. Defendant contended that there was no accretion to the north bank or erosion of the south bank but that the course of the river had changed suddenly by avulsion and that the land next to plaintiff's was the same originally conveyed to defendants. Affirming a judgment for defendant, the court noted that property boundaries are presumed permanent, and one seeking to change those boundaries has the burden of proving that the change in the river's course was due to accretion rather than avulsion. The court reviewed the conflicting evidence and held that the lower court's finding that the land was not an accretion was not against the weight of the evidence. The court also noted that plaintiff did not exercise any adverse use of the entire property. (Liptak-Florida)

ARKANSAS POWER AND LIGHT CO V ORR (LIABILITY FOR FLOOD DAMAGE CAUSED BY NEGLIGENT FLOOD GATE OPERATION).
11 SW2d 761-762 (Ark 1928).

Descriptors: *Arkansas, *Dams, *Flood damage, *Floodgates, Rivers, Water injury, Hydroelectric plants, Legal aspects, Riparian waters, Reservoir operation, Judicial decisions, Adjudication procedure, Riparian land.

Plaintiff riparian owner brought action against defendant power company to recover for flood damage to plaintiff's lands and crops. The damage was caused by water released from defendant's dam. Plaintiff contended that defendant was negligent in operating it s floodgates, thereby flooding plaintiff's land and destroying his crop. Affirming a judgment for plaintiff, the court held that the conflicting evidence as to defendant's negligence was properly submitted to the jury. (Liptak-Florida)
W71-03352

LOUISVILLE AND N RR V VANDIVER (DIVERSION OF RIVER CAUSED BY OBSTRUCTION).
238 Ky 846, 38 SW2d 965-967 (1931).

Descriptors: *Kentucky, *Railroads, *Sand bars, *Alteration of flow, Flow around objects, Bridges, Piers, Susidence, Erosion, Flood damage, Water injury, Adjudication procedure, Legal aspects, Judicial decisions, Rivers, Streams, Riparian land, Bank erosion, Rocks, Floods, Diversion.

Plaintiff riparian landowner sued defendant railroad for damages from flooding and erosion caused by defendant's obstruction of a river. Defendant had erected a bridge over a creek at a point just before it flowed into the river upon which plaintiff's land bordered. To prevent the bridge piers from subsiding, defendant had placed large rocks in the creek. Unprecedented rainfall caused these rocks to wash onto a sandbar in front of plaintiff's land. The sandbar was previously seasonal, being washed away by heavy rainfall and gradually building up in the drier seasons, but the rocks now prevented it from washing away. The sandbar thus grew increasingly larger and began to divert the river, causing it to flood and erode plaintiff's land. Defendant contended that the injury was caused by the unprecedented rain, but the court noted that defendant's rocks were a 'but for' cause of the injury and refused to find error in the lower court's denial of a motion for a directed verdict. The lower court's judgment for plaintiff was affirmed. (Hart-Florida)

POINT PRAIRIE HUNTING AND FISHING CLUB V SCHMIDT (TITLE DISPUTE TO DRY RIVER BED BETWEEN ISLAND AND MAINLAND).
44 SW2d 73-76 (Mo 1931).

Descriptors: *Missouri, *Ownership of beds, *Boundaries (Property), *Accretion (Legal aspects), Rivers, Missouri River, Channels, Land tenure, Islands, Beds, River beds, Boundary disputes, Real property, Legal aspects, Judicial decisions, Adjudication procedure, Riparian land, Prescriptive rights, Surveys.

Plaintiff sued to quiet title to a dry river bed between plaintiff's island on the Missouri River and defendant's property on the mainland. The bed had been formerly a slough or arm of the River but had been gradually filled up so that portions of it were on a level with the island and mainland. Plaintiff claimed title to the island and to the land out to the center line of the old channel between the island and the mainland. Defendant contended that plaintiff's title only conveyed to the boundaries of the island and that the entire dry river bed vested in the mainland owner. Affirming a judgment for plaintiff, the court found that, since the county had already conveyed a portion of the bed to plaintiff, defendant's patent from the county could not have conveyed title to the entire river bed. Therefore, each party owned to the center line of the old channel. The court also noted that it was proper for the lower court to appoint a commission to determine the exact location of the center line of the old channel. (Liptak-Florida)

BAXTER V DAVIS (SALE OF RIPARIAN LAND).
252 Ky 525, 67 SW2d 678-682 (1934).

Descriptors: *Kentucky, *Riparian land, *Nonnavigable waters, *Boundaries (Property), Claims (Contracts), Flooding, Land use, Real property, Rivers, Acreage, Adjudication procedure, Judicial decisions, Legal aspects, Contracts, Land tenture.

Plaintiff vendor of riparian land sued defendant vendee to recover the amount owed on a contract for the sale of land. Defendant admitted the contract and the amount but contended that plaintiff had fraudulently represented the property as 7 1/2 acres, when it was only 5 acres, and as not subject to overflow. The court observed that the river on which the land bordered was non-navigable, and therefore the property boundaries extended to the thread of the stream, including more than 7 acres. Upon perusal of conflicting evidence, the chancellor had found that plaintiff either had not represented the land as not subject to overflow or that such a representation was substantially true. The court, stating that lower court's findings were not clearly erroneous, affirmed the lower court's decision for plaintiff. (Hart-Florida)
W71-03363

WABASH AND ERIE CANAL LANDS (DUTY OF STATE AUDITOR TO EXECUTE PATENTS TO ORIGINAL PURCHASERS OR GRANTEES).
Ind Ann Stat secs 62-901-62-914 (1962).

Descriptors: *Indiana, *Land tenure, *Real property, *Canals, State governments, Land, Legislation, Inland waterways, Administration, Governments, Legal aspects, Federal government, United States, Jurisdiction.
Identifiers: *Patents (Land).

The state auditor must execute patents to the original purchasers or their grantees for all Wabash and Erie Canal lands. Filing procedures are set forth. A patent deed of canal lands from the state auditor vests title in the grantee to the same extent as if a valid deed had been made to the original purchaser for consideration, but such deed does not affect the validity of prior interests or liens on the property. Disputes as to ownership of canal lands are within the jurisdiction of the circuit and superior courts in the county in which the lands are located. The purpose of this act is to correct errors in former conveyances, and no taxes paid may be recovered on the ground that title was formerly in the state. (Dye-Florida)
W71-03365

BECK V KULESZA (LANDOWNER'S RIGHT TO DIVERT STREAM).

156 A 346-50 (Sup Ct Del 1926).

Descriptors: *Delaware, *Obstruction to flow, *Artificial watercourses, *Alteration of flow, Riparian rights, Boundaries (Property), Riparian land, Riparian waters, Diversion, Streamflow, Streams, Reasonable use, Natural streams, Watercourses (Legal), Banks, Legal aspects, Judicial decisions, Tailrace, Flooding.

Plaintiff and defendant owned adjoining property separated by a stream. A tailrace on plaintiff's property ran parallel and below the stream. Defendant by placing debris in the stream's course diverted water which normally flowed in the stream into the tailrace. When the tailrace overflowed and flooded plaintiff's land, plaintiff sought damages against defendant. Defendant contended that plaintiff had originally constructed the stream course to divert water from the tailrace, the natural course, into the stream. Therefore, defendant argued that he was justified in obstructing streamflow and diverting the water back into the natural course. The Delaware Superior Court, in charging the jury, stated that plaintiff, in order to recover, had to provide that the stream was a natural watercourse. A riparian owner who diverts a natural stream from its accustomed channel is liable for damages from resulting overflow onto his neighbors' land. However, riparian owners can within reasonable time divert a stream from an artificial course through their lands back to a natural course. (Powell-Florida)

KINCAID V UNITED STATES (DUTY OF UNITED STATES TO CONDEMN LAND TO BE FLOODED BY DIVERSION CHANNEL).
35 F2d 235-248 (WD La 1929).

Descriptors: *Louisiana, *Levees, *Condemnation, *Federal government, Flooding, Damages, Governments, Flood control, Remedies, Legal aspects, Judicial decisions, Flood plains, Eminent domain, Compensation, State governments, Mississippi River, Political aspects, Legislation, United States, Adjudication procedure.

Plaintiff landowner sought to enjoin defendants Secretary of War, Chief of Engineers, and Mississippi River Commission from flooding his land. Plaintiff's land was situated betweeen two proposed levees and within a channel through which a portion of the waters of the Mississippi River were to be diverted. Plaintiff contended that defendants

uld not flood his land without first having fol-wed the proper condemnation procedures. De-ndants contended that because state law did not quire the state to pay for property taken for vees, the federal government was also protected the state statute. The court held that: (1) a state tute exempting the state from payment for pro-rty taken for levees does not exempt the federal vernment; (2) although the federal government s the authority to construct improvements on d in navigable waters and has police powers alogous to state police powers, a landowner has nding to sue to prevent the government from king his land for such improvements without con-mnation; and (3) riparian owners are protected m undue interference with their riparian rights alteration of streamflow. (Quesada-Florida)

LVER SPRINGS PARADISE CO V RAY AND PATENT AS NOT DEPRIVING PUBLIC F RIGHT TO USE NAVIGABLE WATERS).
F2d 356-360 (5th Cir 1931).

escriptors: *Florida, *Public rights, *Navigable ters, *Ownership of beds, Streams, Public nefits, Federal government, Judicial decisions, gal aspects, Riparian rights, Riparian land, parian waters, Public lands, United States, Beds, ds under water, Relative rights, Land tenure, rings.
entifiers: Patents (Land).

aintiffs' predecessor in title had acquired a deral patent covering land contiguous to a vigable stream. Plaintiffs operated glass-bottom ats on a portion of the stream known as Silver rings. Defendant company acquired land near aintiffs' land and operated a rival glass-bottom-at business on the same portion of the stream. aintiffs sought to enjoin defendant's operations. aintiffs claimed that they had, by virtue of the tent which included land that was submerged by e navigable stream, exclusive rights to operate on e navigable stream. Defendant contended that, cause the United States held the title in trust to navigable stream-beds within the territory of orida, plaintiff did not not acquire any title to merged lands through his predecessor's patent. e Fifth Circuit Court of Appeals held that defen-nt's operation on navigable waters was an exer-e of the public right of navigation. Consequently, aintiff could not enjoin defendant's activities, twithstanding plaintiffs' ownership of the sub-rged lands. The land patent did not deprive the blic of the right to use the navigable waters vering land granted by the patent. Plaintiff quired title to submerged lands subordinate to e public right. (Powell-Florida)

RKE V COMMONWEALTH (TITLE TO CCRETIONS WHERE DEED CONVEYS 'TO IE OCEAN').

3 Mass 63, 186 NE 277-280 (1933).

escriptors: *Massachusetts, *Accretion (Legal pects), *Breakwaters, *Boundary disputes, eans, Legal aspects, Judicial decisions, medies, Local governments, Coastal structures, ore protection, Boundaries (Property), Riparian nd, Land tenure, Shores, Beaches, Navigable ters, High water mark, Low water mark, ashores, Adjudication procedure.

aintiff sought to register title to an oceanfront lot d to land that accreted thereto as the result of the ection of breakwaters by defendant Common-ealth. Defendant town contended that the creted land belonged to it. Neighboring lan-wners contended that they were entitled to an nount of beachfront proportioned to the frontage their original lots. The Supreme Judicial Court Massachusetts affirmed a judgment for plaintiff. aintiff's deed conveyed title to the 'ocean'. onuments govern over measurements in describ-ing a lot's boundaries. Where accretions occur, the line of riparian ownership follows the changing water line. The court stated that the side lines should be at right angles to the low water mark. Defendant received none of the accretions. The other landowners, though now cut off from the new natural beach, were entitled only to the breakwater. Owners of upland without title to adjacent flats may be cut off from the beach by construction in aid of navigation. (Morris-Florida)

TRUSTEES OF NEWPORT CENTER V NILES (WATER COMPANY'S DUTY TO MAINTAIN WORKS AND ADEQUATE SUPPLY).
146 A 71-72 (Vt 1929).

Descriptors: *Vermont, *Administrative agencies, *Public utilities, *Water supply, Water quality, Domestic water, Springs, Watercourses (Legal), Water sources, Pipelines, Maintenance, Repairing, Legal aspects, Judicial decisions, Administration, Governments, Local governments, Water works, Water demand.

Plaintiff trustees of a village petitioned the Public Service Commission of Vermont to compel defendant water-company owners to repair unsatisfactory waterworks and to obtain an additional source of water supply. The Commission issued an order directing defendants to correct their deficiencies and to obtain the new source of water supply. Defendants appealed, and the Supreme Court of Vermont reversed and remanded. Evidence showed that the water system was out of repair. However, it was not shown that a new source of water supply was necessary to enable defendant to furnish customers with an adequate supply of wholesome water. The Commission exceeded its jurisdiction in ordering an additional source of water where the evidence did not show the need for one. (Duss-Florida)

MCGILL V THRASHER (OWNERSHIP OF ACCRETIONS IN RIVER BED BETWEEN ISLAND AND MAINLAND).
221 Ky 789, 299 SW 955-957 (1927).

Descriptors: *Kentucky, *Ownership of beds, *Accretion (Legal aspects), *Islands, Rivers, Streams, Navigable waters, Non-navigable waters, Ohio River, Banks, Bank erosion, Land tenure, Prescriptive rights, Boundaries (Property), Boundary disputes, Riparian rights, Riparian waters, Riparian land, State governments.

Plaintiff owned an island in the Ohio River. The island had greatly enlarged by accretion, extending it upstream and connecting it to the shore. Plaintiff sued defendant riparian owner to quiet title to the accretion opposite defendant's upland, and a second upland owner sued to eject plaintiff from the accretion connected to his property. The Court of Appeals of Kentucky noted that riparian owners own to the middle of the stream, including any land formations, and the same rights accrue to an island owner. However, the court hold that such ownership only includes those accretions adjacent to the riparian land and bounded by lines at right angles to the thread of the stream. Therefore, plaintiff could not claim the upstream accretions opposite defendant's shoreline. The court affirmed a judgment for defendant. The other riparian owner's suit rested on adverse possession. However, actual possession of the mainland was not adverse possession of the adjacent accretions. Therefore, the court reversed a judgment for the second mainland owner. (Liptak-Florida)

UNITED STATES V STEWART (LAND DESCRIBED AS BOUND BY THE WATER'S EDGE IS THAT LAND ABOVE THE MEAN HIGH WATER MARK).
121 F2d 705-714 (9th Cir 1941).

Descriptors: *California, *Islands, *Boundaries (Property), *Boundary disputes, Public lands, Patents, Grants, Judicial decisions, Legal aspects, Navigable waters, Reclamation, Swamps, Overflow, Tidal waters, High water mark, Low water mark, Tides, Tidal effects, Watercourses (Legal), Real property, Marshes.

Plaintiff United States sought to quiet title in itself to a certain island. Defendant contended that the only land that belonged to plaintiff was what was commonly known as Mare island and not the marsh lands attaching thereto. Plaintiff contended that it held title to all the land described in its grant as being bound by the water's edge. The court ruled that the water's edge was the same as the shore. The shore is the land between the ordinary high and low water marks. Where a sea or bay is named as a boundary, the line of the ordinary high water mark is always intended in jurisdictions where the common law prevails. The land in dispute was above the high water mark at the time of the grant and at the time of its confirmation. The trial court's judgment for defendant was affirmed in part and reversed in part. (Price-Florida)
W71-03524

GUCKER V TOWN OF HUNTINGTON (DESTRUCTION OF RIPARIAN RIGHTS OF ACCESS BY RAISING LEVEL OF SAND BAR).
268 NY 43, 196 NE 737-40 (1935).

Descriptors: *New York, *Sand bars, *Riparian rights, *Accretion (Legal aspects), Remedies, Land tenure, Real property, Navigable waters, Bays, Shallow water, Riparian land, Cities, Boundary disputes, Boundaries (Property), Ownership of beds, Legal aspects, Judicial decisions, Adjudication procedure.

Plaintiff owned upland situated on a navigable river. Defendant town owned a sand bar in the waters adjacent to plaintiff's property. Defendant authorized other persons to raise the level of the sand bar to a height above the normal high tide level. The sand bar had previously been sufficiently submerged to allow passage of boats of light draft at high tide. Plaintiff claimed title in the sand bar by accretion and asserted that defendant's actions, by preventing access to the navigable bay, derogated his riparian rights. Affirming plaintiff's riparian right of direct access to the bay, the Court of Appeals of New York observed that the lower court had failed to provide plaintiff a remedy, although it had recognized that his rights were destroyed. Since the action was equitable, the lower court should have provided a remedy. This was so even though the trial court had found title to the sand bar to be in defendant. The lower court's decision was reversed. (Hart-Florida)

VILLAGE OF MILL NECK V TOWN OF OYSTER BAY (ALLOCATION OF WATER DIS-

TRICT PROPERTY AMONG NEWLY INCORPORATED TOWNS).

140 Misc 164, 250 NYS 317-323 (Sup Ct 1931).

Descriptors: *New York, *Water districts, *Public utilities, *Cities, Local governments, Governments, Water supply, Real property, Land tenure, Public utility districts, Public lands, Public rights, Legal aspects, Judicial decisions, Assessments, Government finance, Legislation.

Plaintiff village brought action against defendant town to apportion and distribute the property of a water district. Plaintiff had been a part of the town and the water district and contended that upon incorporation it was entitled to a division of the water district's assets in proportion to the assessed value of plaintiff's property. The Supreme Court of New York noted that, although the statutes entitled plaintiff to an apportionment of the property, the legislature did not intend that the water district's property be sold and the proceeds divided among every new town or village. This would be impossible without destroying the water district. The court held that plaintiff was entitled to an apportioned interest in the water district's property. However, such interest should be neither divisible nor subject to partition and sale so long as the water district continued to function. (Liptak-Florida)

SIEGEL V STATE (STATE LIABILITY FOR NEGLIGENT IMPROVEMENT OF NAVIGATION).

138 Misc 474, 246 NYS 652-665 (Ct Cl NY 1930).

Descriptors: *New York, *Navigable waters, *Stream erosion, *Stream improvement, Damages, Eminent domain, Condemnation, Compensation, Legal aspects, Judicial decisions, Adjudication procedure, Canals, Streams, Non-navigable waters, Riparian rights, Riparian land, Erosion, Accelerated erosion, State governments, Bank erosion, Erosion control, Navigation.

Defendant state, for the purpose of improving a barge canal, lowered the bed of Fish Creek. Wood Creek, which flowed through plaintiff's property, emptied into Fish Creek. The lowering of Fish Creek caused Wood Creek to flow at greatly increased velocity, eroding plaintiff's land. Plaintiff sought damages for appropriation of his property. Defendant contended that it did not appropriate any of plaintiff's property or rights, but that plaintiff's losses were incidental to defendant's attempt to improve navigation. The Court of Claims of New York reversed a judgment for defendant. The acts of defendant, not being in an effort to improve the navigability of Wood Creek, but to improve the navigation in an entirely different channel, it could not escape responsibility for negligent injury to a riparian owner on Wood Creek. Negligence could be found in defendant's failure to erect structures capable of controlling the flow of Wood Creek. (Dye-Florida)

The 400 miles of border between the United States and Canada includes countless numbers and varieties of bodies of water, ranging from meager streams to Lake Superior and the Columbia River Since the establishment of the Border Treaty of 1909, the International Joint Commission has resolved such issues as insuring equitable effects from one countries' diversion of rivers and overseeing a fair division of water resources and facilities which border both countries. The author deals at length with the instrumentation that the commission uses to carry out its work and praises its record of achievement. He stresses the need to adjust to the new problems of the future and mentions that the commission has already dealth with such joint concerns a pollution and maintenance of recreational facilities. India's National Institute of Oceanography is aiding in the expansion of India's fishing industry by extensive exploration for new fishing waters and for deep sea water potentialities. The author points to the need for more and larger trawlers so that sufficiently mature fish can be caught in deeper waters further offshore. In addition to exploring for fish, the Indian government has begun to explore for oil in the Gulf of Cambay on India's west coast. It is expected that more than 4 million tons of crude oil will be obtained from offshore drilling by 1978-79. (Holmes-Trutgers)

WISCONSIN V MICHIGAN (NAVIGABLE WATER AS BOUNDARY BETWEEN STATES).

295 US 455, 55 S Ct 786-789 (1935).

Descriptors: *Wisconsin, *Michigan, *Boundary disputes, *Equitable apportionment, Boundaries (Property), Legal aspects, Water rights, Islands, Streams, Lakes, Great Lakes, Lake Michigan, Riparian rights, Bays, Federal jurisdiction, Judicial decisions, Channels, Bodies of water, Interstate.

The waters of Green Bay comprised a portion of the boundary between plaintiff Wisconsin and defendant Michigan. The enabling act creating the state of Michigan described the center of the 'most usual ship channel' of the Bay as the boundary line between plaintiff and defendant. A boundary dispute between the parties arose over the fact that two distinct ship channels existed, to either of which the description might apply. The United States Supreme Court, in affirming the opinion of special master, held that the waters of Green Ba should be divided between the states so as to giv equality of opportunity in use of its waters. I reaching its decision the Court considered the prin ciple that when a navigable stream is the boundar between states, the middle of the main channel, a distinguished from the geographical middle of th stream, limits jurisdiction of each state. This is s unless the boundary is otherwise fixed by agree ment. The Court assumed that Congress intende in the Michigan enabling act to give the partie equality of right and opportunity for navigation an fishing. (Powell-Florida)

Identifiers: *Zuyder Zee, *Polar lands, *World resources, Oceanic trench, Chemicalization.

This article discusses the problems faced by th world community in maintaining its economic well being through the prudent use of the world resources. Technology is cited as a means that ha been, and will continue to be, quite helpful in thi endeavor. The role of water resources is especiall important to economic maintenance and develop ment. One example cited is the Dutch reclamatio of the Zuyder Zee and the alluvial banks at th mouth of the Rhine. The U.S. depression of th 1930's coupled with successive bad season focused American attention on the problems of soi erosion, and the need for action similar, although not quite as drastic, as the Dutch. It is suggested that it may be economically feasible to retrieve

uable material carried into American rivers rough the erosion process. (See also W71-631) (Murphy-Rutgers)

NNECO, INC V GREATER LAFOURCHE RT COMM'N (LIABILITY FOR COST OF ELINE CHANGES BECAUSE OF CHANNEL PROVEMENT).

F2d 1061-1066 (5th Cir 1970).

criptors: *Pipelines, *Permits, *Channel im-vement, *Right-of-way, Navigable waters, Bay-Louisiana, State governments, United States, ulation, Public rights, Easements, Eminent ain, Condemnation, Legal aspects, Judicial isions, Oil, Oil industry, Navigation.

ntiff oil company brought action against defen-t port commission to recover the cost of lower-a pipeline crossing a navigable channel. Defen-t contended that both plaintiff's state and ral permits required it to bear the cost of nges necessitated by channel improvement. ntiff contended that the permit requirements lied only to that part of the pipeline covered by permit, that is, that part of the pipeline under gable waters. Plaintiff argued that defendant liable for the cost of changes in the pipeline on cent upland. Reversing a judgment for defen-t, the court held that conditions in the permits ld only be construed as applicable within the al pipeline right-of-way, not to portions of the eline outside of the right-of-way and on private perty. KING V UNITED STATES (INVERSE CONDEMNATION BY FLOODING FROM BACKWATER).

427 F2d 767-770 (Ct C1 1970).

Descriptors: *Dams, *Backwater, *Condemnation, *Floods, Water injury, Flood damage, United States, Kansas, Federal government, Rivers, Navigable rivers, Damages, Compensation, Riparian land, Riparian waters, Riparian rights, Overflow, Legal aspects, Judicial decisions, Eminent domain, Condemnation value.

Plaintiff landowners brought action against defendant United States for inverse condemnation of their property, which was intermittently flooded by backwater from a dam. Plaintiffs contended that the flooding resulted in a taking of their property. Defendant contended that plaintiffs' property was subject to flooding before the erection of the dam and that some plaintiffs claimed damage to lands rented out to other plaintiffs as crop tenants. The court held that the construction of the downstream dam, subjecting property to increased flooding, constituted a taking of property under the fifth amendment. The court also noted that it was possible to separately compensate those owning different interests in the land and crops. Judgment was entered for plaintiffs. (Liptak-Florida)
W71-03745

BRYANT V PEPPE (TITLE TO SUBMERGED LAND REMAINS IN STATE AFTER EMERGENCE BY AVULSION).
238 So 2d 836-839 (Fla 1970).

Descriptors: *Florida, *Ownership of beds, *Avulsion, *Land tenure, Boundaries (Property), Beds, Navigable waters, State governments, Gulf of Mexico, Taxes, Assessments, Boundary disputes, Riparian land, Riparian waters, Real property, Islands, Legal aspects, Judicial decisions, Public lands, Public rights.

Plaintiff landowners sued defendant state public land trustees to quiet title to land. The land had been submerged between two keys, but emerged as dry land as a result of avulsion during a hurricane. The state claimed the land as sovereignty land by reason of its originally submerged character. Plaintiffs contended that they held title by virtue of equitable estoppel because the land had been assessed as gulf-front property and plaintiffs had paid taxes thereon for many years. Reversing a judgment for plaintiffs, the court held that equitable estoppel was a proper remedy to bolster title already existing. However, estoppel could not be used to divest the state of its title. Submerged land does not lose its sovereign character when, by avulsion, it becomes dry land. (Liptak-Florida)
W71-03746

LANGEVIN V FLETCHER (BOUNDARY DISPUTE WHERE CONVEYANCE IS TO BANK OF BROOK IN RAVINE).
273 Mass 543, 174 NE 194-196 (1931).

Descriptors: *Massachusetts, *Boundry disputes, *Streams, *Banks, Beds, Boundaries (Property), Real property, Land tenure, Adjudication procedure, Legal aspects, Judicial decisions, Ravines, Gullies, High water mark, Ownership of beds, Land, Channels.

Plaintiff riparian landowner sought to register her land. Defendant contiguous landowner opposed her registration. Both tracts had formerly been owned by plaintiff, but plaintiff had conveyed defendant's tract to her brother. The conveyance was to the 'bank' of a brook which was in the bottom of a deep ravine with long sloping sides. Defendant contended that his boundary was the edge of the stream at the ravine's bottom, whereas plaintiff asserted that the boundary was the top of the ravine. Noting that a conveyance bounded by a stream bank normally excludes the streambed when the bank has a width apart from the bed, the Supreme Judicial Court of Massachusetts observed that an unusual meaning attributed to 'bank' might be shown from the entire deed and the surrounding circumstances. The court held that the deed was ambiguous, permitting introduction of extrinsic evidence to show plaintiff's intent. On the introduction of such evidence, the court held that the conveyance was to the top of the ravine, although it had never been a 'bank' of the stream. (Hart-Florida)

A UNIFIED NATIONAL PROGRAM FOR MANAGING FLOOD LOSSES.
Task Force on Federal Flood Control Policy, Washington, D.C.

Report by the Task Force on Federal Flood Control Policy, House Document No 465, transmitted in a communication from the President of the United States, Aug 1966. 47 p, 11 fig.

Descriptors: *Flood control, *Flood plains, *Flood forecasting, *Federal government, Flood damage, Flood plain insurance, Rivers, Floods, Planning, Costs, Cost sharing, Engineering structures, Levees, Reservoirs, Watersheds (Basins), Channels, Water policy, Projects, Project planning, State governments, Feasibility studies, Federal project policy, Administrative agencies, Flood plain zoning, Legislation.

Submitting its report on methods of reducing flood losses, the President's Task Force on Flood Control Policy stresses the need for a more unified national program. Basic proposals by the task force indicate a need: (1) to improve basic knowledge about flood hazards, (2) to coordinate and plan new developments on the flood plains, (3) to provide technical services to managers of flood plain property, (4) to move toward a practical national program for flood insurance, and (5) to adjust federal flood control policy to sound criteria and changing needs. Under these basic headings are delineated the roles of various federal agencies in collection and dissemination of flood information, flood forecasting, and assistance to states in flood plain planning. Cost-sharing requirements, flood project benefits and other monetary aspects of flood control programs also receive attention. The report describes the present condition of the nation's flood plains in terms of past federal investment in: (1) flood control, (2) past flood losses and estimated future losses, (3) effectiveness of flood control projects, and (4) benefits derived from them. Elements bearing on the problem of flood damages are also discussed. (Duss-Florida)
W71-03773

EXECUTIVE ORDER 11296 (EVALUATION OF FLOOD HAZARD IN FEDERAL ACTIVITIES).
Exec Order No 11296, Federal Register, Vol 31, No 155, Aug 11, 1966. 2 p.

Descriptors: *Federal government, *Floods, *Flood plains, *Administrative agencies, Flood damage, Flood control, Flood protection, Structures, Construction, Government finance, Regulation, Highways, Land, Administration, Federal budgets, Planning, Administrative decisions, United States.
Identifiers: *Executive orders.

Because of the existant uneconomic use of the nation's flood plains, the increasing potential for flood losses, the extensive federal involvement in construction of facilities in flood hazard areas, and the determining factor federal financing can play in land development, the President issued to various federal agencies Executive Order 11296. The President ordered that heads of executive agencies encourage a unified effort to prevent uneconomic uses of flood plains and, particularly, act to lessen the risk of flood losses in connection with federal lands and institutions. All agencies involved with construction of federal structures, government financing of structures, disposal of federal land,

and land use planning were ordered to evaluate flood hazards in their respective spheres of operation. The heads of each agency may issue appropriate rules and regulations to accomplish the first objective of the order. Agencies to which requests for flood hazard information may be addressed are specified. In all requests for appropriations for federal structures, the agency involved shall transmit to the Bureau of the Budget its findings regarding evaluation of flood hazards in the proposed development. (Duss-Florida)

BOUNDARY WATERS PROBLEMS OF CANADA AND THE UNITED STATES (RESOLUTION OF BOUNDARY DISPUTES BY THE INTERNATIONAL JOINT COMMISSION),
L. M. Bloomfield, and Gerald F. Fitzgerald.
Boundary Waters Problems of Canada and the United States, Carswell Co, Ltd, Toronto, Canada (1958). 264 p, 1 map, 329 ref, 9 append.

Descriptors: *United States, *Treaties, *International waters, *International Joint Commission, International law, Water law, Federal government, Foreign waters, International commissions, Legal aspects, Judicial decisions, Governments, Administrative agencies.
Identifiers: *Boundary waters.

In the Boundary Waters Treaty of 1909 between the United States and Canada, the International Joint Commission was formed and charged with judicial, investigative, administrative, and arbitral functions pertaining to boundary waters. This work relates: (1) the history of the Commission's formation, (2) purposes of the treaty, (3) the Commission's activities, and (4) the Commission's organization and rules of procedure. A detailed examination of the Commission's judicial function includes: (1) jurisdiction, (2) treaty rules governing judicial decision, (3) orders of approval, (4) compensation and indemnity, and (5) agreements between parties. The author concludes that: (1) the Commission has functioned extremely well, (2) the main prospective role will be investigation and recommendation, (3) the Commission has been reluctant to decide legal issues, and (4) regional and local requirements have been given careful consideration. Included in the work are summaries of the first 72 cases brought before the Commission. (Hart-Florida)

MAINE LAW AFFECTING MARINE RESOURCES, VOLUME I: STATE GOVERNMENT ORGANIZATION: AGENCIES DEALING WITH MARINE RESOURCES.
Maine Univ., Portland. School of Law.

Available from NTIS as PB-189 467, $3.00 in paper copy, $0.95 in microfiche. University of Maine Law School, 1969. 156 p, 1 chart, 351 ref.

Descriptors: *Maine, *State governments, *Administrative agencies, *Administration, Governments, Legislation, Political aspects, Legal aspects, Institutions, Organizations, Regulation, Coordination, Administrative decisions, Water law, Economics, Leadership, Planning , Water resources development, Water resources, Resources, Natural resources, Water policy, Conservation, Water conservation.
Identifiers: *Marine resources.

An important aspect of Maine law affecting marine resources is the structure of the administrative machinery responsible for ocean related activity. This survey of Maine agencies seeks to answer several questions: (1) Could better management of Maine's ocean potential be achieved by realignment or consolidation of existing entities. (2) What should be the configuration of the new administrative structure. (3) What are reasons for the charges and obstacles to be overcome. The discussion is divided into four parts. Part I summarizes the general administrative structure of water resources agencies and gives general suggestions for consolidation and improvement. Part II describes those agencies which, although not exclusively marine agencies, affect marine resources, including each agency's interrelationship with other agencies in the field. Part III suggests consolidation of some functions and describes political factors and attitudes which have impeded reorganization in the past. Part IV presents those proposals of previous reports, governors, and other state officials which have received inadequate notice and implementation. (See also W71-03784 thru W71-03786) (Dye-Florida)
W71-03783

MAINE LAW AFFECTING MARINE RESOURCES, VOLUME II: STATE, PUBLIC, AND PRIVATE RIGHTS, PRIVILEGES, AND POWERS.
Maine Univ., Portland. School of Law.

Available from NTIS as PB-189 468, $3.00 in paper copy, $0.95 in microfiche. University of Maine School of Law, p 157-417, 1970. 6 charts, 746 ref, 1 append.

Descriptors: *Maine, *Public rights, *Riparian rights, *Water law, Legal aspects, Relative rights, Natural resources, Coasts, Harbors, Oceans, Administrative agencies, Planning, Legislation, Water resources development, Marine fisheries, Fishing, State governments, Federal government, Water resources, Conservation, Boundaries (Property), Accretion (Legal aspects), Avulsion, Judicial decisions.
Identifiers: *Marine resources, Private rights.

Volume II of a four-volume report on Maine law affecting marine resources, this work examines Maine water resources law and its social and economic impact on the exploitation of the state's marine-related resources. Chapter I appeared in Volume I and dealt with state government structure. Chapter two discusses international, federal, and state law regarding marine boundaries, including: (1) the extent of state territorial waters; (2) local governmental boundaries; (3) private and public lands at the seashore; (4) construction of deeds of conveyance between adjacent riparian owners; and (5) the effects of accretion, avulsion, and reliction on boundaries. Chapter three deals with relative public and private rights in tidal lands and water, with emphasis on the colonial ordinances from which such law is derived. Classification of waters as navigable or non-navigable is examined, along with the state's right to regulate navigation. Chapter four discusses the legal structure within which the state may exploit or dispose of Maine's water resources. Constitutional limitations on the state are explored, concluding with the opinion that few such strictures exist. An appendix lists cases referred to in Volumes I and II. (See also W71-03783) (Dye-Florida)
W71-03784

MAINE LAW AFFECTING MARINE RESOURCES, VOLUME III: REGULATION OF THE COAST: LAND AND WATER USES.
Maine Univ., Portland. School of Law.

Available from NTIS as PB-192 023, $3.00 in paper copy, $0.95 in microfiche. University of Maine Law School, p 419-627, 1970. 1 map, 2 illus, 2 chart, 497 ref, 4 append.

Descriptors: *Maine, *Land use, *Regulation, *Coasts, Land management, Shores, Land resources, Natural resources, Legal aspects, Legislation, Land development, Recreation, Zoning, State governments, Local governments, Institutions, Planning, Water resources development, Water resources, Water pollution, Water law, Water pollution control.
Identifiers: *Marine resources.

Volume III of a four-volume report on Maine law affecting marine resources, this volume deals with coastal regulation relating to land and water uses. In Chapter five the extent and effects of polluti in Maine's coastal waters are discussed, along w the common law and statutes bearing on water p lution in Maine. Chapter six considers Maine l regulating coastal land and the adjacent envir ment. Laws are discussed as to their necessity a appropriatenesss, with emphasis on regulation recreational usage. Municipal, regional, and st planning to maintain and improve the quality coastal land usage is also emphasized. Chap seven attempts to apply concepts of land use c trol to water areas below the low-water mark, as which a comprehensive plan for usage regulatio otherwise lacking. Chapter eight examines the fect of state taxation on marine resource usa Chapter nine discusses state and federal machin dealing with problems of coastal erosion. Chap ten reviews water-related legislation enacted b 1970 special session of the Maine legislatu reproducing in full acts: (1) preventing the dun ing of out of state waste in Maine waters; (2) re lating selection of industrial sites; and (3) preve ing petroleum pollution of coastal waters. Identifiers: *Marine resources.

Volume IV of a four volume report on Maine affecting marine resources, this volume is c cerned with international, federal, and state reg tion of the extraction of resources from the s Chapter eleven deals with treaties and laws affe ing Maine fisheries. The ends sought by fishing l are discussed, with an attempted evaluation of th effectiveness. Included are taxing provisio prohibitions against foreign fishermen, anti-t regulations, and the economic and ecological c siderations influencing fishing regulation. Chap twelve deals with legislation regulating the extr tion and cultivation of renewable marine resour mainly shellfish. The conflict between commer fishing for such resources and their conservat for public use is emphasized. Chapter thirt discusses restrictions on the utilization of mar resources as food, emphasizing health and qual control measures. Consideration is given to reg tion under the Federal Food and Drug Act and efforts to promote and market Maine's mar products. Chapter fourteen discusses regulati and state agencies governing extraction of mine from Maine's waters. Chapter fifteen deals w federal imitations on state control of mar resources--both under the constitution and un federal legislation. (See also W71-03783) (D Florida)

riptors: *Legislation, *National forests, *Mis- , *National recreation areas, Conservation, use, Recreation, Scenery, Natural resources, flow, Scenic easements, Agriculture, Legal ts, Forest management, Land resources, , Project purposes, Water resources develop- , Boundaries, Land, United States.

ngs on H.R. 6289 to establish the Ozark c Riverways in the Clark National Forest in ate of Missouri were held before the Subcom- e on Forests of the House Committee on ulture. The general purpose of the bill was to rve and develop for the use and enjoyment of the people of the United States the unusual recreational, scenic, and other natural and physical values along the Current and Eleven Point Rivers in the state of Missouri, including their preservation as free-flowing streams. The bill would obtain this objective by establishing the Ozark Scenic Riverways, to be administered by the Secretary of Agriculture as part of the Clark National Forest. The riverways would be generally comprised of relatively narrow strips of land along the Current and Eleven Point Rivers. Under the bill, the exterior boundaries of the Clark National Forest would be modified to include those portions of the designated riverways area lying outside the Forest's existing boundaries. Within the riverways, the Secretary of Agriculture would be authorized to acquire needed lands and interests in land, including scenic or conservation easements. (Finman-Florida)
W71-03789

STATUS OF PENDING WATERSHED PROJECTS.
Committee on Agriculture (U. S. House).

Hearing, 90th Cong, 2d Sess, June 19, 1968, p 3-22.

Descriptors: *Watershed Protect. and Flood Prev. Act, *United States, *Water policy, *Multiple-purpose projects, Water resources development, Watershed management, Legislation, Legal aspects, Social aspects, Project benefits, Project planning, Project feasibility, Governments, Programs, Financing, Financial feasibility.
Identifiers: *Constitutionality.

A hearing before the House Committee on Agriculture was held to determine the status of pending watershed projects. Testimony was offered by the Deputy Director of the Bureau of the Budget, and the Assistant Secretary of Agriculture, with regards to pending programs authorized under the Watershed Protection and Flood Prevention Act. Testimony indicated that authorized watershed projects have been limited by: (1) inadequate financial appropriations, (2) President Johnson's decision not to seek a second term, and (3) President Johnson's attack on the constitutionality of the Watershed Protection and Flood Prevention Act. The Act provided that final approval for projects costing the federal government over $250,000 was vested in the House and Senate Agriculture Committees. The President contended that this privision endeavored to empower the legislative branch, or part of it, to participate in the execution of laws, a function vested by the Constitution in the executive branch. A list of pending watershed projects is set forth. (Powell-Florida)
W71-03790

WATERSHED PROJECTS.
Committee on Agriculture (U. S. House).

Hearings on Miscellaneous Subjects, 87th Cong, 1st Sess, Feb 15 and 16, 1961, p 3-87.

Descriptors: *Legislation, *Multiple-purpose projects, *Watersheds (Basins), *Water resources development, Flood protection, Project benefits, Project purposes, Project feasibility, Project planning, United States, Flood control, Legal aspects, Social aspects, Recreation, Water policy, Watershed management, Water utilization, River basin, Development, Cost sharing, Cost-benefit ratio, Financing, Costs, Federal government.

Hearings before the Committee on Agriculture were held to hear testimony advocating the approval of several watershed projects. The watershed projects involved were: Fishing Creek, South Carolina; Leatherwood Creek, Virginia; Marsh Creek, Kentucky; Tortugas Arroyo, New Mexico; Upper Josephine-Jackson, Florida; and Waianae Iki, Hawaii. Testimony was offered in favor of the respective projects by various public officials and private individuals, who discussed the economic, social and legal aspects of such watershed projects. The Committee hearing explored the financial aspects of watershed protection and flood prevention programs, including cost sharing, valuation of acreage, acquisition of rights-of-way, and construction, operation and maintenance costs. The Committee also investigated the estimated cost of the watershed projects for each acre benefited. (Powell-Florida)

LAW AND THE ENVIRONMENT.
Edited by Baldwin, Malcolm and Page, James K, Jr. New York, Walker and Co, 1970. 432 p, 738 ref.

Descriptors: *Legal aspects, *Water pollution, *Water law, *Environment, Ecology, Judicial decisions, Federal government, United States, Administrative agencies, Administrative decisions, Water pollution sources, Water pollution effects, Balance of nature, Environmental effects, Legislation, Wildlife, Remedies, Air environment, Aquatic environment, Adjudication procedure.

The main subdivisions of this book on environmental law include: (1) Problems of Litigation, (2) Needed Developments in the Laws, and (3) Opportunities and Mechanisms to Meet the Needs. The first subdivision discusses the Santa Barbara Oil Spill history, its current status, and future predictions. It also examines the use of expert witnesses in environmental litigation. In the second subdivision the following topics are discussed by various authors: (1) burden of proof, (2) standing to sue, (3) the constitutional right to a decent environment, (4) the trust doctrine, and (5) the governmental role in environmental litigation. The third subdivision is divided into three topics: (1) the attorney's role in environmental litigation, (2) law college programs in the environmental field, and (3) trends in developing the environmental curriculum. Each section is followed by a panel discussion of the topic among the various authors involved. (See also W71-03793 thru W71-03798) (Hart-Florida)

THE ROLE OF GOVERNMENT IN ENVIRONMENTAL CONFLICT,
Harold P. Green.
In: Law and the Environment, New York, Walker and Co 1970, p 235-247.

Descriptors: *Federal government, *Environmental effects, *Administrative agencies, *Legislation, Legal aspects, Public rights, Environment, Remedies, State governments, Social aspects, Administrative decisions, Pollution abatement, Ecology, Costs, Cost analysis, Balance of nature, Regulation, Administration.
Identifiers: *Ecological impact.

In this response to what the role of government should be in environmental conflict and how this role can be effectively played, it is suggested that private litigation cannot successfully defend the environment; hence, the government must intervene. The author suggests that government action may take three forms: (1) amicus curiae or intervenor; (2) legislation establishing environmental standards and prohibiting environmentally detrimental activities; and (3) regulatory legislation administered by an agency charged with establishing and enforcing environmental standards. Since each role requires legislation, the difficulty of inducing legislative action is examined. Determining that the fundamental problem in inducing legislation is the paucity of information available on the costs, risks, and adverse consequences of technological advancement, the author concludes that an ombudsman-type administrative agency should be established as an arm of Congress. The agency would be charged with the sole function of investigating, publicizing, and pressing upon Congress, the public, and the administrative agencies the potential adverse consequences involved in activities affecting the environment. (See also W71-03792) (Hart-Florida)
W71-03793

OUTLINE OF FEDERAL ENVIRONMENTAL LAW FOR THE PRACTICING LAWYER,
James Watt Moorman.
In: Law and the Environment, New York, Walker and Co 1970, p 182-234.

Descriptors: *Water pollution, *Legal aspects, *Environment, *Remedies, Water utilization, Federal government, Water pollution sources, Water pollution effects, Ecology, Balance of nature, Environmental effects, Highway effects, Wildlife, Judicial decisions, Air environment, Aquatic environment, Estuarine environment, Deserts, Legislation, United States, Administrative agencies, Administrative decisions.

The author's outline of federal environmental law for the practicing lawyer is divided into two major areas--procedural and substantive environmental matters. In the procedural portion, jurisdiction (with emphasis upon standing), discovery, and other matters such as burden of proof and evidence are examined. The substantive portion is subdivided into three parts: (1) pollution, (2) land and water use, and (3) the public domain. Under 'pollution', the author discusses: (1) water pollution, with emphasis upon the effect of federal legislation in the area; (2) air pollution; (3) pesticides; and (4) noise pollution. Under 'land and water use', the various means of combatting pollution of rivers, estuaries, and coastal waters are examined with respect to federal control and legislation. The means of combatting strip mining, highway routing, and fish and wildlife destruction are also discussed. In the subsection entitled 'the public domain', the author examines federal lands and parks, Alaska, the Outer Continental Shelf, and the Bureau of Land Management. (See also W71-03792) (Hart-Florida)
W71-03794

STANDING TO SUE IN CONSERVATION SUITS,
Louis L. Jaffe.
In: Law and the Environment, New York, Walker and Co 1970, p 123-133.

Descriptors: *Legal aspects, *Judicial decisions, *Public rights, *Administrative decisions, *Environment, Administrative agencies, Natural resources, Decision making, Federal government, Legislation, Water resources development, Remedies, Conservation.
Identifiers: *Standing to sue, Constitutional aspects.

The question considered by this chapter is: Who can initiate or participate in proceedings to preserve or improve environmental amenities. For this purpose, environmental action suits are categorized as either nuisance or non-nuisance actions. A private citizen cannot sue to enjoin a public nuisance without showing a particular injury; therefore, the public's right to abate a nuisance is normally enforced by public authorities. Because the public is often under-represented in administrative decisions, the public might seek judicial review of the decision. However, participation is severely inhibited by the constitutional case-or-controversy concept. Court decisions are analyzed, holding variously: (1) that a federal taxpayer has standing to contest federal expenditures in aid of religious activity; (2) that a conservation association is within the zone of interests protected by legislation requiring the FPC to consider the environmental impact of a power plant, and therefore has standing; (3) that television listeners are entitled to participate in both a hearing and review on the permit renewal of a TV station; and (4) that a party injured in fact and arguably within the zone of protected interests has standing to seek review of administrative action. The author concludes these decisions establish a general trend to liberalize the standing concept. (See also W71-03792) (Hart-Florida)
W71-03795

THE RIGHT TO A DECENT ENVIRONMENT: PROGRESS ALONG A CONSTITUTIONAL AVENUE,
E. F. Roberts.
In: Law and the Environment, New York, Walker and Co 1970, p 134-165.

Descriptors: *Environment, *Legal aspects, *Judicial decisions, *Public rights, Pollution abatement, Air pollution, Soil contamination, Water pollution, Thermal pollution, Legislation, Federal government, State governments, Community development, Environmental effects, Zoning, Eminent domain, Condemnation, Cities, Industries, Land use, Social aspects, Remedies, Ecology, Real property.
Identifiers: *Constitutional aspects.

Speculating upon whether a right to a decent environment can be found within the Bill of Rights of the United States Constitution, this chapter primarily analogizes to the development of the right to privacy. Since the right to a decent environment cannot be expressly found, the author posits that it must be within a penumbra of one of the other amendments, or impliedly found in the ninth amendment. The use of the zoning power to maintain a decent environment is discussed in some detail. Also, the use of the eminent domain power in conjunction with the concept of the 'new property' is analyzed as a means of improving our environment. Rejecting both the zoning power and property law changes as inadequate to satisfy the public's demand for a halt to environmental destruction, the author concludes that a Supreme Court decision styled after Griswold v Connecticut, 381 US 479 (1965), is a necessary predicate to securing an improved environment. Moreover, the author recommends prospective application, leaving to legislators the task of correcting existing violations of the right to a decent environment. (See also W71-03792) (Hart-Florida)
W71-03796

LAW IN ACTION: THE TRUST DOCTRINE,
Edward Berlin, Anthony Z. Roisman, and Gladys Kessler.
In: Law and the Environment, New York, Walker and Co , 1970, p 166-181.

Descriptors: *Reservation doctrine, *Environment, *Land use, *Public rights, Legal aspects, Judicial decisions, Pollution abatement, Real property, Land tenure, Air pollution, Soil contamination, Water pollution, Thermal pollution, Legislation, Federal government, Remedies, State governments, Community development, Environmental effects, Administrative agencies, Administrative decisions, Social aspects, Ecology.
Identifiers: *Constitutional aspects, *Trust doctrine.

Speculating on application of the trust doctrine to improve the environment and to prevent further deterioration, property is categorized into three types: (1) property owned by the government, (2) property privately owned and used consistently with public interest; and (3) property privately owned but used inconsistently with public interest. As to government-owned property, the author suggests that mandamus and similar remedies may be used to prevent use inconsistent with the public interest; he also suggests that the fifth amendment impliedly requires that government property be used only in the public interest. For property in the second category, it must be established that the trust has been in existence from the beginning of our constitutional government and that all property transfers have an implicit condition that it will be used in the public interest. Two alternatives are suggested for establishing public interest in property in category three: (1) a condemnation action to preserve the property for public benefit; and (2) a mandamus action, joining the landowner, to require condemnation for the public. Although admitting that the expanded concepts of the trust doctrine are radical, the author concludes that such expansion presents a viable possibility for advancement in the environmental area. THE SANTA BARBARA OIL SPILL,
Malcolm F. Baldwin.
In: Law and the Environment, New York, Walker and Co 1970, p 5-47. 142 ref.

Descriptors: *Oil industry, *Administrative agencies, *Federal government, *Water pollution control, Water pollution sources, Water pollution effects, Oil, Water pollution, Pollutants, Environmental sanitation, Water pollution treatment, Administrative decisions, State governments, United States, Leases, Legislation, Rivers and Harbors Act, Submerged Lands Act, Oil fields, Natural gas, Exploitation, Legal aspects.
Identifiers: *Santa Barbara Oil Spill, Water Quality Improvement Act.

The Santa Barbara Oil Spill is a lesson to be remembered. Although the spill was relatively minor the effects were severe. Oil leasing began in the channel in 1965, following settlement of a jurisdictional dispute. The leases were subject to count pressures by the Budget Bureau and oil companies vis-a-vis the public. The varied federal statute procedures, and agencies failed to prevent the spi A post-mortem reveals that some requiremen were meticulously followed while others were o served only in form. After the spill, the Departme of the Interior established new regulations f drilling and exploration, and began to require lea ing companies to submit proprietary information the Department. The President's panel reco mending renewed pumping to stop leakage w severely criticized. Congress responded to the sp by enacting the Water Qaulity Improvement A providing strict liability for oil spills up to $8 m lion. However, the act does not affect drilling l bility beyond the three-mile limit. The constit tionality of the Act has been questioned, a several companies have asserted that it breach the leases. Other action for damages from the sp and injunctions to prevent future drilling, ha been filed. (See also W71-03792) (Hart-Florida)

ILLINOIS LAWS RELATING TO WATE WAYS, 1969.
Illinois State Dept. of Public Works and Buildin Springfield.

Springfield, 1970. 246 p.

Descriptors: *Legislation, *Inland waterwa *Water law, *Illinois, State governments, Strea Lakes, Navigable waters, Non-navigable wate Bridges, Boats, Canals, Administrative agenci Flooding, Flood control, Navigation, Watershe (Basins), Watershed management, Water cons vation, Cities, Parks, Water pollution, Le aspects, Federal government, Rivers.
Identifiers: Constitutions.

Consolidated into this single volume are the: (1) linois statutes pertaining to rivers, lakes, a streams; and (2) Illinois statutes relating to authority, duties, and jurisdiction of the Depa ment of Public Works and Buildings and its D sion of Waterways. Pertinent sections of the Illin constitution preface thw work. Additiona federal legislation has been furnished where it terrelates with included state legislation. Supp menting extensive special legislation pertaining specific rivers or flood control districts are laws general applicability. Some titles of acts in t latter category are: bridges; pure water board; b registration and safety; civil administration; co missions; counties; criminal laws; drainage; flo control; municipal code; nuisances; polluti refuse from outside the state; rivers, lakes a streams; sanitary districts; watershed protect and flood prevention; water terminals; wa authorities; and waterways. ER QUALITY STANDARDS.
nia State Water Control Board, Richmond.

1970. 59 p.

riptors: *Virginia, *Standards, *Water quality ol, *Water quality, Legislation, Municipal , Domestic water, Legal aspects, Social ts, Public health, Recreation, Potable water, eation, Water treatment, Water pollution con-Municipal wastes, Sewage, Water resources.

nia Water Quality Standards are established e Virginia State Water Control Board. The ards first set forth include those rules with al state-wide application, including standards lished for the protection of public or mu-al water supplies and standards which apply at ater intake points. Next set forth are the rules specific application based on climate, geo-ical area, or uses. The primary classifications ters within the State are enumerated. Virginia quality standards apply to fourteen basin and n descriptions, including: (1) Big Sandy River , (2) Clinch River Basin, (3)Holston River , (4) New River Basin, (5) Roanoke River , (6) Chowan River Basin, (7) Shenandoah Basin, (8) Rappahannock River Basin, (9) River Basin, (10) James River Basin, (11) peake Bay and Atlantic Ocean, (12) Yadkin Basin, (13) Albermarle Sound, and (14) nac River Basin. A key to special standards is ded. (Powell-Florida)

WATERS AND WETLANDS: HOW THE PS OF ENGINEERS CAN HELP PREVENT R DESTRUCTION AND POLLUTION.
e Comm on Gov't Operations. Committee on rnment Operations (U. S. House).

Cong, 2d Sess, HR Rep No 91-917. 18 p, 30

iptors: *Federal government, *Administra-gencies, *Administration, *Permits, Control, ation, Regulation, Governments, United States, Navigation, Navigable waters, Water pollution, Water pollution sources, Conservation, Institutions, Riparian rights, Coastal engineering, Coastal structures, Rivers and Harbors Act, Transportation, Industries, Wastes, Waste disposal.
Identifiers: *Corps of Engineers.

By the House Committee on Government Operations, this report deals with measures which can be taken by the Army Corps of Engineers to alleviate the unfavorable ecological impact of private construction in or about navigable waters. Emphasis is placed on the Corps' procedures for reviewing and approving applications for construction. The committee recommends that the Corps, rather than basing approval wholly on the public interests to be served in the areas of navigation and commerce, give more weight than in the past to the possible ecological effects of the private activity. It is recommended that harbor lines established by the Corps be regarded as mere guidelines instead of absolute limits within which construction would be permitted without application. The Committee recommends that the burden should be on the applicant to prove that proposed construction would not be damaging to the ecology. Furthermore, the Corps should vigorously enforce the Refuse Act of 1899, prohibiting the dumping of foreign substances into navigable waters. (Dye-Florida)

THE LAW OF INTERNATIONAL WATERWAYS,
R. R. Baxter.
The Law of International Waterways, Harvard Univ Press, Cambridge, Mass, 1964. 371 p, 2 tab, 1,118 ref, append.

Descriptors: *International waters, *Foreign waters, *Canals, *International law, Channels, St Lawrence Seaway, Panama Canal, Canal zone, Navigation, Regime, Water conveyance, Administration, Political aspects, Governments, Legal aspects, Judicial decisions, United States, International commissions, Legal aspects.
Identifiers: *International waterways, Interoceanic canals.

Those rivers, canals, and straits used to a substantial extent by commercial shipping or warships belonging to nations other than the riparian nation are international waterways. Discussing the international law relating to such waterways, major divisions of this book include: (1) operating agencies for international waterways, (2) passage of ships in peacetime, (3) passage of ships in wartime, (4) legal controls in the fiscal sphere, (5) technical problems of administration of international waterways, and (6) international administration of international canals. Five means of operating an international waterway are discussed: (1) administration by a private company (Suez Canal); (2) operation of an interoceanic canal by a foreign sovereign (Panama Canal); (3) operation of interoceanic canals by a territorial sovereign (Kiel and Suez Canals); (4) international cooperation (St Lawrence Seaway); and (5) international administration through international commissions. In an appendix, articles on the navigation of international canals are proposed as a model codification of existing customary law of international waterways. Emphasis is placed upon interoceanic canals. (Hart-Florida)

NATURAL RESOURCES IN THE GOVERNMENTAL PROCESS A BIBLIOGRAPHY SELECTED AND ANNOTATED,
Arizona Univ., Tucson. Inst. of Government Research.
David F. Paulsen.
Tucson, University of Arizona Press, 1970. 99 p.

Descriptors: *Bibliographies, *Publications, *Reviews, *Natural resources, Economics, Forests, Water resources, Water resources development, River basins, Federal government, Grants, Research and development, Water pollution, Decision making, Social aspects, Flood control, Reclamation, Resources development, Resources, Conservation, Governments, Fishing, State governments, Water conservation, Water policy.

A selected and annotated bibliography of the literature relating to governmental action in the field of natural resources, this book summarizes the literature, assesses trends, and evaluates the potential for further development in the area. Chapter two catalogues literature dealing with social theory and policy formation in the natural resources area. Chapter three examines basic natural resources literature including: fishing, minerals, natural resources of the ocean, and soil conservation. Chapter four emphasizes studies concerned with the governmental development of specific river basins. Chapter five catalogues works concerning: (1) water policy-formation processes; (2) reclamation, dams, and flood control; (3) water systems of state and local government; and (4) water pollution. References are listed alphabetically under each topic, and an index to the authors of the catalogued work follows the text. (Barnett-Florida)

A SURVEY OF NEW HAMPSHIRE WATER LAW,
New Hampshire Univ., Durham. Water Resources Research Center.
Alexander J. Kalinski, and Robert H. Forste.
Available from NTIS as PB-197 122, $3.00 in paper copy, $0.95 in microfiche. WRRC Bulletin 3, July 1970. 42 p, 46 ref. OWRR Project A-011-NH (4).

Descriptors: *New Hampshire, *Riparian rights, *Judicial decisions, *Water law, Legal aspects, Riparian land, Usufructuary right, Reasonable use, Remedies, Riparian waters, Alteration of flow, Competing uses, Natural use, Obstruction to flow, Surface waters, Drainage water, Repulsion (Legal aspects), Riddance (Legal aspects), Surface runoff, Groundwater, Percolating water, Reservation doctrine, Eminent domain, Condemnation, Compensation.

The two objectives of this survey are to describe the development of the common law riparian doctrine of New Hampshire and to examine water resources actions of recent years. Six aspects of the New Hampshire riparian doctrine are discussed: (1) the general extent of the riparian right, (2) the riparian owner, (3) riparian land, (4) doctrinal development, (5) surface waters, and (6) groundwaters. Various New Hampshire supreme court decisions bearing on these aspects are analyzed in depth. The recent water resources actions discussed include: (1) nuisance abatement; (2) the public trust doctrine; (3) private exercise of eminent domain; and (4) mandamus. New Hampshire supreme court decisions pertaining to these actions are examined. (Hart-Florida)

RESTORING THE QUALITY OF OUR ENVIRONMENT.
President's Science Advisory Committee, Washington, D.C. Environmental Pollution Panel.

For sale by the Superintendent of Documents, US Government Printing Office, Washington, DC 20404, Price $1.25. Report of the Environmental Pollution Panel, President's Science Advisory Committee, Washington, D.C, Nov 1965. 317 p, 11 append.

Descriptors: *Investigations, *Pollutant identification, *Federal government, *Environmental effects, Integrated control measures, Waste identification, Regulation, State governments, Local governments, Interstate, Water pollution sources, Water pollution control, Water resources development, Dredging, Municipal sewage, Salinity, Mine wastes, Domestic wastes, Public health, Interstate compacts, Legal aspects, Effluents, Political aspects, Project planning, Water pollution effects.

Recommendations for federal, state, and local action to restore the quality of the environment are set forth in this comprehensive appendixed examination of the effects and sources of pollution. The study encompasses the: (1) health effects of pollution, (2) polluting effects of detergents, (3) deterioration of materials and urban environments, and (4) climatic effects of pollution. The sources of pollution considered in this study are: (1) municipal and industrial sewage, (2) animal wastes, (3) mining wastes, (4) consumer wastes, and (5) unintentional releases of pollutants. Actions are proposed in twenty-eight areas of environmental concern. Among the proposals in the establishment of interstate compacts and entities to protect coastal marshes, lagoons, estuaries, river basins, and other water resources. Other proposals of the panel include: (1) a system of 'effluent charges' on polluters, (2) the creation of governmental groups to deal with outmoded sewerage systems, (3) the denial of federal funds for construction not minimizing dust and sediment in watersheds; (4) the consideration of salinity problems in agricultural planning, and (5) an examination of the environmental effects of granting dredging permits. The report also recommends programs in the areas of base-line measurement, development and demonstration of pollution control technology, research, and manpower. (Earl-Florida)

FLORIDA'S WATER RESOURCES (ASSESSMENT OF LEGAL CHANGES NECESSARY TO UTILIZE FULLY FORIDA'S WATER RESOURCES.
Florida Water Resources Study Commission, Gainesville.

Florida's Water Resources, Florida Water Resources Study Commission, Gainesville, Fla, Dec 1956. 91 p, 46 fig, 9 tab, 99 ref.

Descriptors: *Florida, *Water resources, *Water policy, *Water resources development, Water quality, Water supply, Water pollution, Hydrologic cycle, Surface water, Groundwater, Natural resources, Water utilization, Public rights, Legislation, Administration, Riparian rights, Topography, Streams, Water pollution control, Erosion, Administrative agencies, State governments, Legal aspects.

By the Florida Water Resources Study Commission, this report to the governor and the legislature gives an overall evaluation of the state's water resources and the problems and needs facing the state. Chapter 1 outlines water problems of Florida and provides a county-by-county assessment of: (1) diffused surface water; (2) streams, lakes and canals; (3) groundwater; and (4) tidal waters. Chapter 2 discusses existing water laws of Florida. Subjects include: (1) the riparian system, (2) navigability and governmental powers, (3) drainage legislation, (4) pollution control legislation, (5) diffused surface waters, (6) groundwaters and (7) the interrelationships between waters in different categories. Solution of legal problems is discussed. Chapter 3 gives facts about Florida's water resources. Chapter 4 discusses present water resources programs. Local, state, educational, and federal agency activities receive attention. Chapter 5 summarizes findings and conclusions and evaluates the adequacy of resources, the state of law, and water quality. Chapter 6 outlines commission recommendations, which include: (1) enactment of a comprehensive water law, preserving insofar as possible existing rights of Florida water users; and (2) establishment of an agency to administer the new law and insure optimum utilization of state water resources. (Duss-Florida)

6F. Nonstructural Alternatives

PRELIMINARY REVIEW AND ANALYSIS OF FLOOD CONTROL PROJECT EVALUATION PROCEDURES,
INTASA, Menlo Park, Calif.
N. V. Arvanitidis, R. L. Lind, J. Rosing, and G. P. Johnson.
Available from NTIS as AD-713 482, $3.00 in paper copy, $0.95 in microfiche. U.S. Army Engineer Institute for Water Resources Final Report No IRR-70-01, IWR-70-3 Sept 1970. 131 p, 28 fig, 13 tab, 10 ref. Contract DACW07-70-C-0050.
Identifiers: *Floods, Control, Protection, Damage, Management planning, Simulation, Costs, Terrain, Law, Maintenance, Economics, Statistical analysis, Reviews. *Flood control, Flood plain management, Land enhancement.

The study clarifies the economic consequences and effects of programs designed to protect or otherwise manage flood plains. A firm basis is established to appropriately distinguish between the source of change of a flood plain development from its economic effects. Alternative techniques for the measurement of benefits are presented. Where the development in the flood plain will be the same with and without the project, benefits attributable to the project will equal total damages reducee. Where there is project induced growth, the benefits attributable to the project are equal to the net increase in productivity of the economy due to the relocation of activities both inside and outside the flood plain. Benefits from project induced growth (so-called 'land enhancement' benefits) can be measured by the difference between the net income (profits) of activities which move into the flood plain with protection and the net income they could earn outside the flood plain. In the absence of direct observation of change in net income, benefits from project induced growth can be measured in terms of simulating damages reduced to new activities that would locate in the flood plain with protection.
W71-03531

NON-STRUCTURAL METHODS OF FLOOD-PLAIN MANAGEMENT: IDENTIFICATION, EVALUATION, AND SELECTION,
Illinois Univ., Urbana.
William Eugene Fraser.
M Landscape Arch Thesis, Illinois University, 1970. 73 p, 10 fig, 3 tab, 80 ref. OWRR Project A-030-ILL (1).

Descriptors: *Non-structural alternatives, *Flood protection, Flood plain zoning, Land use, Legal aspects, Planning, Water management (Applied), Regulation, Flood plain insurance, Zoning, Taxes.
Identifiers: *Flood plain management.

Non-structural methods of floodplain management are listed. Various methods were evaluated as to their suitability for reducing flood damages, and a process of selecting one or several of the methods that best meet the needs of the individual, agency, or community was developed. Non-structural methods of floodplain management can be arranged into three general groups: (1) methods to protect the health and safety of the floodplain residents, (2) methods to inform the floodplain residents of the flood hazards, and (3) methods to regulate the development on the floodplains. The arid Southwest irrigation and N-fertilizers h very strong influences on growth and fruiting cotton plants. Temperature and humidity wit the canopy are also affected. Insects respond ferentially to environmental changes and therefo the effects of water and N variables on the c ecosystem should elicit responses in insect popu tions. In 2 different seasons (1962 and 1968) an 2 different southern California locations, cot plots were treated with factorial combinations o rigation schedules and N-application. At the en the growing season, measurements were made plant heights and populations of spider mites, ly bugs (Lygus hesperus knight) and predatory eyed bugs (Geocoris pallens Stal). Three-dim sional graphs of N and water applications and fi measurements were constructed. Increase in eit management variable produced increases in pl growth. Highly significant differences in ins numbers between some treatments were dem strated, indicating strong correlations betw phytophagous insect abundance and agronor practices. All results are preliminary and not c clusive. (Casey-Arizona)

ifiers: *Snow depth gages, *Water content w).

ydrologic data telemetering system was ned to have the highest accuracy of any M telemetering system known. The repeata- of readout approaches 0.05%. This accuracy appreciably deteriorated in the presence of noise levels in radio telemetry transmissions. igh accuracy is obtained by: (a) a frictionless ducer; (b) a specially designed tracking filter; (c)a wide-range frequency deviation of plus or minus 40% permitting greater resolution and accuracy; (d) readout subsequently converted to usable units by aid of a digital computer; and (e) locating the electronics and the transducer in a temperature stable environment, underground. The frictionless transducer technique was used in developing a low-displacement type pressure transducer for measuring the water-content of snow. A method was developed for the automatic plotting of isohyetal lines on an analog computer. (Knapp-USGS)

BRIDGER INSTRUMENT MODIFICATION,
Montana State Univ., Bozeman. Water Resources Research Center.
Duain Bowles.
Available from NTIS as PB-196 727, $3.00 in paper copy, $0.95 in microfiche. Montana University Joint Water Resources Research Center Report No 2, September 1966. 30 p. OWRR Project B-006-MONT (1).

Descriptors: *Instrumentation, *Telemetry, *Data transmission, Water levels, Thermometers, Data collections, Weather data, Electronic equipment, Snow cover, Calibrations, Network design, Snowpacks, Computers, Data processing.
Identifiers: *Bridger (Mont), Weather data telemetry, *Telemetry networks.

Modifications were designed for operation on the Belfort Universal Raingage, the Leopold-Stevens Water level Recorder, and the Belfort Recording Microbargraph. In addition, thermistor thermometers were constructed to operate at the research areas thermograph locations. Specifically, the modifications were designed to permit electrical interrogation of existing devices now being operated at the Bridger, Montana research area to provide a resistive readout. Calibration tests were conducted to verify that the instrument modifications met the design requirements. Corrections for temperature effects upon the various potentiometers can be made in analysis of the data or on site by installation of a compensation device such as a thermistor. BRIDGER HYDROMETEOROLOGICAL RESEARCH AREA AND FACILITIES,
Montana State Univ., Bozeman. Water Resources Research Center.
R. J. Rickabaugh.
Available from NTIS as PB-196 728, $3.00 in paper copy, $0.95 in microfiche. Montana University Joint Water Resources Research Center Report No 4, January 1967. 26 p. OWRR Project B-006-MONT (2).

Descriptors: *Instrumentation, *Telemetry, *Data transmission, Water levels, Thermometers, Data collections, Weather data, Electronic equipment, Snow cover, Calibrations, Network design, Snowpacks, Computers, Data processing.
Identifiers: *Bridger (Mont), Weather data telemetry, *Telemetry networks.

The Bridger Hydrometeorological Research Area, University of Montana, is located 20 miles north of Bozeman on Highway 293, on the east slope of the Bridger Mountain Range. There are now over 225 miles of insulated copper conductor in this area for collection and transmittal of field data. This outdoor laboratory overlaps the Bridger Bowl ski area. The cable complex fans out from the 'Bridger Data Center', a building located near the center of the complex at about 6,500 ft. elevation. It is accessible by car in any season of the year. The electronics equipment converts the incoming data from research sites into coded form for transmission to the campus. The remote control for the transmitter that transmits digital information to the University is also located in this building. Meters at this location give wind speed and direction at the ridge of the mountain range, half way up the slope, and at the data center. On the ridge of the range the University built a 10' x 12' 'A' frame shelter fully insulated and having commerical power for heat, lights, etc. It is also a terminal for a 100 conductor cable originating one mile down the slope in the Data Center. A transmitter located here is part of the telemetry system. Commercial power can be extended from this point to other locations on the ridge. (See also W71-03376) (Knapp-USGS)

BRIDGER TELEMETRY COMMUNICATIONS SYSTEMS,
Montana State Univ., Bozeman. Water Resources Research Center.
Robert E. Leo.
Available from NTIS as PB-196 729, $3.00 in paper copy, $0.95 in microfiche. Montana University Joint Water Resources Research Center Report No 5, January 1967. 11 p, 13 fig. OWRR Project B-006-MONT (3).

Descriptors: *Instrumentation, *Telemetry, *Data transmission, Water levels, Thermometers, Data collections, Weather data, Electronic equipment, Snow cover, Calibrations, Network design, Snowpacks, Computers, Data processing.
Identifiers: *Bridger (Mont), Weather data telemetry, *Telemetry networks.

The Bridger Telemetry Communications System provides Frequency Modulation (FM), Very high Frequency (VHF), radio equipment in order to transmit digital hydrometeorological data from the Bridger Mountain area north of Bozeman, Montana, to the Electronics Research Laboratory on the campus of Montana State University, Bozeman, Montana. Either a voice or data mode may be used. The voice mode may be used to communicate in both directions over the link for maintenance purposes and in normal operations is very seldom used. The data mode provides for transmission on 171.9 MHz of digital data in one direction only -- from Bridger to ERL. The equipment is entirely 110 volt AC operated at the ERL end of the link and at the Bridger Data Center. The ridge transmitter is operated from a 12 volt car battery which is kept charged from a trickle charger. (See also W71-03376) (Knapp-USGS)
W71-03378

BRIDGER HYDROMETEOROLOGICAL DATA ACQUISITION SYSTEM,
Montana State Univ., Bozeman. Water Resources Research Center.
Lee E. Cannon.
Available from NTIS as PB-196 730, $3.00 in paper copy, $0.95 in microfiche. Montana University Joint Water Resources Research Center Report No 6, February 1967. 32 p, 3 append. OWRR Project B-006-MONT (4).

Descriptors: *Instrumentation, *Telemetry, *Data transmission, Water levels, Thermometers, Data collections, Weather data, Electronic equipment, Snow cover, Calibrations, Network design, Snowpacks, Computers, Data processing.
Identifiers: *Bridger (Mont), Weather data telemetry, *Telemetry networks.

The Data Acquisition System installed at Bridger Bowl, Montana, was designed and constructed to record a wide variety of hydrometeorological parameters in a computer compatible form. The system consists of power supplies to operate the system; digitizers; even counters; programmable scanner and clock; controller to accept signals from the digitizers, the event counters, the scanner, and the clock, and to generate the output record; and the terminal board. The system is capable of interrogating up to 99 channels of information. Of these, any five may be connected to the five 3-digit event counters. Any parameter which can be normalized in the 0-300 microampere range can be recorded by the system. (See also W71-03376) (Knapp-USGS)
W71-03379

RELIABILITY OF A VARIANCE ESTIMATE OBTAINED FROM A SAMPLE AUGMENTED BY MULTIVARIATE REGRESSION,
Geological Survey, Arlington, Va.
E. J. Gilroy.
Water Resources Research, Vol 6, No 6, p 1595-1600, December 1970. 6 p, 3 ref.

Descriptors: *Regression analysis, *Date collections, *Sampling, *Networks, Gaging stations, Hydrologic data, Statistical methods, Variability.
Identifiers: *Multivariate regression.

A sample augmented by multivariate regression estimates was used to estimate the population variance associated with the sample. The sampling variance of the estimator obtained from the lengthened sample was derived and compared with the sampling variance computed from the original unaugmented sample. The relative reliability of the variance estimate based on the original observations is found to depend on the multiple correlation between the original and the augmenting variables. One application of these results is found in the design of gaging station networks. Given an existing set of gaging stations and faced with the decision of which subset of stations to retain, the network designer may wish to give consideration to estimating both the mean and the variance at the discontinued sites. A discontinued site would then correspond to the variable with the short sample record. The results given will aid in this decision making process. (Knapp-USGS)

THE USE OF FALLOUT CESIUM-137 AS A TRACER OF SEDIMENT MOVEMENT AND DEPOSITION,
Agricultural Research Service, Oxford, Miss., Sedimentation Lab.
Jerry C. Ritchie, J. Roger McHenry, Angela C. Gill, and Paul H. Hawks.
In: Proceedings Water Resources Conference, Mississippi State University, State College, April 14-15, 1970, published by Mississippi State Univ Water Resources Research Institute, p 149-162, 1970. 14 p, 3 fig, 2 tab, 13 ref. OWRR Project A-999-Miss (6).

Descriptors: *Tracers, *Tracking techniques, *Sediment transport, *Fallout, *Tagging, Mississippi, Silting, Provenance, Reservoir silting, Sediment yield, Soil erosion, Deposition (Sediments), Cesium.
Identifiers: *Sediment movement tracers.

Radioactive fallout tags soil particles with identifiable radioisotopes so that movement of these particles can be followed through the sedimentation process. The content of cesium-137, a gamma emitter (0.662 Mev) and a fallout product, was determined in a number of selected soils and sediments from the Little Tallahatchie River Watershed above Sardis Dam, Mississippi. The variation in measured concentrations of cesium-137 in sediment profiles can be related to periods of maximum fallout. The age of the upper sediments and the rate of deposition can be estimated. A greater depth and rate of sediment accumulation were found in the deeper parts of the reservoir area sampled. The recent (1963-69) rate of sedimentation is less than in prior years (1959-63). Soils under forest cover contain more cesium-137 than those under grass. Where soils have eroded, cesium-137 content is less. The cesium-137 content is less in sandy soils than in finer textured soils because of the differences in ion exchange capacity of the soils. (See also W71-03380). (Knapp-USGS)

A NEW SIMPLIFIED INSTRUMENT FOR WATER TEMPERATURE MEASUREMENTS,
Swedish Meteorological and Hydrological Inst., Stockholm.
Oscar Cabelis.
Nordic Hydrology, Vol 1, No 4, p 209-215, 1970. 7 p, 6 fig, 4 ref.

Descriptors: *Water temperature, *Bathythermographs, *Thermometers, Instrumentation, Depth, Equipment, Measurement, Calibrations.
Identifiers: *Thermistors.

Through the rapid development in the field of electrotechniques and the development of highly sophisticated precision components it has been possible to design a new simplified electrical instrument for the measurement of water temperature. This instrument consists of a bridge, a thermistor probe with leads, and a galvanometer. The instrument has been used for five years under extreme weather conditions. The instrument has shown very relia readings. The most recent version of the probe r be used in salt water at depths as great as 200 ters. Measurements can probably be made c siderably deeper with good reliability. (Kna USGS)

AN EVALUATION OF THE INFRA-RED TH MOMETER AS AN AIRBORNE INDICATOR SURFACE WATER TEMPERATURES,
Department of Transport, Toronto (Ontar Meteorological Branch.
T. L. Richards, and D. G. Massey.
Manscript, October 29, 1965. 24 p, 14 fig, 7 ta ref.

Descriptors: *Water temperature, *Infra-red ra tion, *Evaporation control, *Weather d Meteorology, Remote sensing, Evaporation, La Reservoirs, *Great Lakes, Lake Ontario.
Identifiers: *Infra-red thermometer, *Airbo radiation thermometer.

Obtaining data on surface water temperatures i value to many uses. It is most useful for forecas meteors logical conditions over the lakes and t adjacent land areas and for assessing water lo through evaporation and in studies of the forma and dissipation of ice. An infra-red thermom (IRT) was installed on an aircraft as an airbo radiation thermometer (ART) and subjected program of test and evaluation as an instrumen these measurements over the Great Lakes. The phase of the program dealt with the mounting exposure of the sensor. The second, in conjunc with the research vessel 'Poste Dauphine' d mainly with operational and theoretical aspect the technique. It is concluded that, although the posure of the sensor is critical, the ART, when i in suitable weather and with proper calibra checks, provides a good technique for making and reliable water temperature surveys of the G Lakes. The optimum height for such surveys pears to be 500 feet or lower; however, if nece ry, flights at one or two thousand feet appear t feasible with proper calibration. Absolute and tive accuracies appear to be of the orders of 1.0 C and 0.5 deg C respectively. (Herrera-Vander

LT TRACING METHOD FOR MEASUR- CHANNEL VELOCITIES IN SMALL NTAIN STREAMS,
e Univ., Orono; and Sleepers River Research rshed, Danville, Vt.
l Calkins, and Thomas Dunne.
Journal of Hydrology, Vol 11, No 4, p 379-392, November 1970. 14 p, 5 fig, 2 tab, 18 ref.

Descriptors: *Discharge measurement, *Tracers, *Tracking techniques, *Small watersheds, *Stream gages, Electrolytes, Saline water, Mixing, Water storage, Hydrograph analysis, Velocity, Channel morphology, Discharge (Water), Rainfall-runoff relationships, Vermont.
Identifiers: Experimental watersheds.

Because measuring or calculating channel velocities in small mountain streams is very difficult due to the high variability of the channel geometry parameters and roughness characteristics, a salt tracing procedure was examined. The technique is simple and quick, using materials that are commonly available at most research watersheds and water resource centers. The velocity through the channel reach using the salt tracing method was found to be a better representation of the average stream velocity than that computed by the continuity equation at three channel cross sections. REMOTE RECORDING PRECIPITATION GAGE,
N. A. Zykov.
Trans from Trudy Gosudar. Gidrol. INST-TA, No 168, 1969. Soviet Hydrology: Selected Papers, No 4, p 351-356, 1969. 6 p, 2 fig, 2 tab, 2 ref.

Descriptors: *Precipitation gages, *Telemetry, Automation, Instrumentation, Calibrations, Equipment, Gaging stations, Snowfall, Rainfall, Precipitation (Atmospheric).
Identifiers: *Automatic precipitation gages, USSR.

The Valdai Hydrologic Scientific Research Laboratory, USSR, designed a remote recording (totalizing) precipitation gage. This gage is portable and consists of separate receivers for liquid, solid, and mixed precipitation, a pulse detector, remote communication lines, and a battery power supply. The pulse detector is a plastic tipping vessel. It was found that the precipitation measured with the remote-recording precipitation gage differs little from that measured with the sunken rain gage. RADIOMETRIC METHODS OF MEASURING THE SOIL MOISTURE CONTENT,
A. M. Dimaksyan, and N. P. Glazkov.
Trans from Trudy Gosudar Gidrolog Inst-Ta, No 168, 1969. Soviet Hydrology: Selected Papers, No 4, p 333-351, 1969. 19 p, 15 fig, 1 tab, 18 ref.

Descriptors: *Soil moisture meters, *Nuclear moisture meters, Reviews, Instrumentation, Calibrations, Moisture content, Nuclear meters, Soil density probes, Soil moisture.
Identifiers: Neutron moisture meters, USSR.

Methods of determining soil moisture are reviewed and new radiometric methods developed in the USSR are described. The State Hydrologic Institute has investigated the neutron method from 1965 to 1968. It was found that moisture measurements with neturon moisture meters and their calibration are best performed through the cadmium ratio. The determination of the soil moisture content reduces to measurements of the ratio count rate of moderated neutrons with a cadmium shield to those without it. This considerably reduces instrument errors and errors associated with the instability of the neutron source, while the measurement range broadens to 100%. The cadmium ratio is a reliable quantitative characteristic of soil moisture. This ratio increases monotonically from 1 to 18 as the moisture content changes from 0 to 100%. With this in view, the Isotope and Radio Electronics Section of the State Hydrologic Institute has developed and constructed instruments for measuring soil moisture at the surface and in the deeper layers. Identifiers: *Hurricane Camille (1969), U. S. Geological Survey, *Flood mapping.

On November 10, 1969, 12 weeks after Hurricane Camille hit the Mississippi gulf coast the U. S. Geological Survey made public distribution of 14 Hydrologic Atlases showing highwater elevations and the area inundated by the floodwater accompanying the hurricane. These atlases are the culmination of effort that began within 12 hours after the hurricane came ashore in the Bay St. Louis-Pass Christian area. Excluding printing, the cost of the atlases was about $14,000. Behind the Geological Survey's effort to get this information to the public as quickly as possible was the realization that any realistic and effective settlement of insurance claims and the plans for rebuilding in the devastated area would require the delineation of land area flooded. Through close cooperation at all levels, the Survey was able to produce in three months a series of maps that normally requires one to two years to complete. (See also W71-03380). (Knapp-USGS)

DOWSING EXPERIMENTS,
Institute for Industrial Research and Standards, Dublin (Ireland).
R. A. Foulkes.
Nature, Vol 229, No 5281, p 163-168, January 15, 1971. 6 p, 7 fig, 5 tab, 3 ref.

Descriptors: *Dowsing, *Subsurface investigations, *Groundwater, Methodology, Testing, Evaluation.
Identifiers: *Dowsing evaluation (Great Britain), Controlled testing.

The results of several methods of dowsing under controlled experiments organized by the British

Army and Ministry of Defense are presented. The results obtained seem no more reliable than a series of guesses, as indicated in the following experiment. A test of the ability to detect flowing water was arranged with the cooperation of an experienced dowser. A 2-inch polythene pipe carried the water under a lawn and was controlled by a stopcock which the dowser could not see. He was asked to say whether or not the water was flowing in a series of twenty-five trials, the stopcock being on or off in a prearranged random sequence. He used a V shaped rod (rose cuttings) and walked across the line of the pipe to give his verdict. Two sequences were carried out giving fifty results. The water was flowing in twenty-five of these. The dowser was correct in nine cases of water flowing and in sixteen of it not flowing, that is, he was correct in twenty-five out of fifty cases. This is entirely consistent with chance (guessing) and shows no evidence of being able to detect flowing water. (Woodard-USGS)

COMPILATION OF HYDROLOGIC DATA, DEEP CREEK, COLORADO RIVER BASIN, TEXAS, 1968.
Geological Survey, Austin, Tex. Water Resources Div.

Geological Survey Report, 1970. 86 p, 2 fig, 4 tab.

Descriptors: *Rainfall-runoff relationships, *Data collections, *Surface waters, *Hydrologic data, *Flood protection, *Texas, Watershed management, Flood control, Levees, Floods, Streamflow, Rainfall, Runoff, Erosion, Sediment transport, Water quality, Chemical analysis, Gaging stations, Stream gages, Discharge measurements, Flow rates, Peak discharge, Average flow, Reservoirs, Water storage, Storage capacity, Water resources, Reservoir stages.
Identifiers: *Data compilation (Hydrologic), *Deep Creek (Tex).

Runoff and storage data collected during the 1968 water year (October 1967-September 1968) for the 43.9-square-mile area above the stream-gaging station Deep Creek near Mercury, Texas, and the 8.31-square-mile area above the stream-gaging station Dry Prong Deep Creek near Mercury, Texas are presented. The location of floodwater-retarding structures and hydrologic instruments in the area are shown. These 6 structures have a combined capacity of 7,030 acre-feet and regulate floodflow from 25.3 square miles. The weighted-mean rainfall over the Deep Creek study area for the water year was 35.13 inches and 33.05 inches over the Dry Prong Creek study area, or 27% above the long-term average rainfall of 27.74 inches at Brownwood. The ratio of rainfall to runoff ranged from 7.7 to 12.3% for the stations with continuous recording gages. Storm periods were selected for detailed computations. These computations include detailed time breakdown of rainfall and discharge. The water in the reservoirs contained calcium and bicarbonate as the predominant ions. The dissolved solids ranged from 133 mg/liter to 199 mg/liter. (Woodard-USGS)

COMPILATION OF HYDROLOGIC DATA, HONEY CREEK, TRINITY RIVER BASIN, TEXAS, 1968.
Geological Survey, Austin, Tex. Water Resources Div.

Geological Survey Report, 1970. 78 p, 2 fig, 4 tab.

Descriptors: *Rainfall-runoff relationships, *Data collections, *Surface waters, *Hydrologic data, *Flood protection, *Texas, Watershed management, Flood control, Levees, Floods, Streamflow, Rainfall, Runoff, Erosion, Sediment transport, Water quality, Chemical analysis, Gaging stations, Stream gages, Discharge measurements, Flow rates, Peak discharge, Average flow, Reservoirs, Water storage, Storage capacity, Water resources, Reservoir stages.
Identifiers: *Data compilation (Hydrologic), *Honey Creek (Tex).

Rainfall, runoff, and storage data collected during the 1968 water year (October 1967-September 1968) for the 39.0-square-mile area above the stream-gaging station Honey Creek near McKinney, Texas are presented. The location of floodwater-retarding structures and hydrologic instruments in the area are shown. The 12 structures provide capacity for temporary storage of 8,320 acre-feet of flood runoff from 20.9 square miles of the 39.0-square-mile drainage area. The average rainfall was 41.87 inches, or 121% of the 15-year (1953-68) average. The monthly-rainfall totals ranged from 1.04 inches in November to 6.22 inches in September. The mean daily discharge at the stream-gaging station Honey Creek near McKinney was 35.3 cfs, compared with the 17-year average 17.5 cfs. Annual runoff at the stream-gaging station was 25,610 acre-ft, or 12.31 inches. Three storm periods were selected for detailed computations. These computations include a detailed time breakdown of rainfall and discharge, hydrographs, and mass curves. The water in the reservoirs contained calcium and bicarbonate as the predominant ions. The dissolved solids ranged from 148 mg/liter to 209 mg/liter. (Woodard-USGS)

COMPILATION OF HYDROLOGIC DATA, GREEN CREEK, BRAZOS RIVER BASIN, TEXAS, 1968.
Geological Survey, Austin, Tex. Water Resources Div.

Geological Survey Report, 1970. 66 p, 2 fig, 3 tab.

Descriptors: *Rainfall-runoff relationships, *Surface waters, *Data collections, *Hydrologic data, *Flood protection, *Texas, Watershed management, Floods, Levees, Flood control, Streamflow, Runoff, Erosion, Sediment transport, Water resources, Gaging stations, Stream gages, Discharge measurements, Flow rates, Peak discharge, Reservoirs, Water storage, Storage capacity, Reservoir stages.
Identifiers: *Data completation (Rainfall-runoff), Green Creek (Tex).

Rainfall and runoff data collected during the 1968 water year (October 1967-September 1968) for the 46.1-square-mile area above the stream-gaging station Green Creek near Alexander, Texas are presented. The investigation is part of a study to define the various factors of rainfall-runoff relationships before and after floodwater-retarding structures were build. There are eight floodwater-retarding structures with a total combined capacity of 7,500 acre-feet below the flood-spillway crests, that control approximately 50 percent of the drainage area above the streamgaging station. The weighted-mean rainfall over the study area during the 1968 water year was 36.06 inches, or 114 percent of the 1931-60 long-term mean annual rainfall of 31.67 inches at Dublin, Texas. The mean daily discharge at the stream-gaging station Green Creek near Alexander was 14.6 cfs compared with the 10-year average of 5.48 cfs. The annual runoff at the stream-gaging station was 10,610 acre-feet, representing an equivalent depth of 4.32 inches. Six storm periods were selected for detailed computation. These computations include detailed time breakdown of rainfall and discharge, hydrographs, and mass curves. (Woodard-USGS)

Identifiers: *Murrumbidgee River Basin (Australia), *Streamflow basic data, *Australia.

Streamflow data for the Murrumbidgee River Basin, Australia, are presented as volume 1 of three volumes of streamflow records (to 1965) from the Snowy Mountains Region. Streamflow records which could be used for the investigation of the Snowy Mountains scheme began with one station in 1890 and reached a maximum of 122 stations in 1958. This was supplemented by a comprehensive meteorological network to provide detailed information on the variability of runoff, storm rainfalls, snow depth, evaporation and other meteorological elements. The records for each gaging station are presented in three forms: (1) a summary page which contains geographical data, a history of the station, and a summary of its records; (2) Monthly records which contain the runoff volumes of each month of record and the maximum instantaneous discharges observed in each month; and (3) Daily records which contain the daily average discharge. (See also W71-03709 and W71-03710). (Woodard-USGS)

STREAMFLOW RECORDS OF THE SNOWY MOUNTAINS REGION, AUSTRALIA TO 1965 - VOLUME 2: UPPER MURRAY RIVER BASIN.
Snowy Mountains Hydro-Electric Authority, Cooma (Australia).

Snowy Mountains Hydro-Electric Authority Data Report, April 1970. 365 p, 1 map.

Descriptors: *Hydrologic data, *Surface waters, *Streamflow, *Flow measurement, *Gaging stations, Data collections, Discharge measurement, Average flow, Peak discharge, Stream gages, Meteorology.
Identifiers: *Upper Murray River Basin (Australia), *Streamflow basic data, *Australia.

Streamflow data for the Upper Murray River Basin, Australia are presented as volume 2 of three volumes of streamflow records (to 1965) from the Snowy Mountains Region. Streamflow records which could be used for the investigation of the Snowy Mountains scheme began with one station in 1890 and reached a maximum of 122 stations in 1958. This was supplemented by a comprehensive meteorological network to provide detailed information on the variability of runoff, storm rainfalls, snow depth, evaporation and other meteorological elements. The records for each gaging station are presented in three forms: (1) A summary page which contains geographical data, a history of the station, and a summary of its records; (2) Monthly records which contain the runoff volumes of each month of record and the maximum instantaneous discharges observed in each month; and (3) Daily records which contain the daily average discharge. (See also W71-03708). (Woodard-USGS)

BRIDGE DESIGN CONSIDERING SCOUR AND RISK,
Arizona Univ., Tucson; and Bureau of Public Roads, Washington, D.C.
E. M. Laursen.
Proc Amer Soc Civ Eng, Transp Eng J ASCE, Vol 96, No TE2, p 149-164, May 1970. 16 p, 11 fig, 5 tab, 4 ref, 2 append.

Descriptors: *Bridges, *Piers, Abutments, *Erosion, Design, Rivers, *Bridge design, *Bridge piers, *Scour, Economic feasibility, Maximum probable flood, Foundation failure, Pile foundations, Flood forecasting.

The conclusion of a simple economic analysis is the construction of a bridge foundation so designed that the bridge is safe from scour occurring in the maximum probable flood. Cases of pier scour alone and abutment scour alone are analyzed, assuming reasonable costs of bridge and foundation piles, flood magnitude-frequency relations plotting as straight lines on log-normal paper, the risk of loss during the life of the bridge, and scour prediction relations somewhat verified in the field. CONTROL MEASUREMENTS ON DAMS. RAPID SURVEY METHODS,
Electro-Watt Engineering Services Ltd., Zurich (Switzerland).
R. Sinniger.
Tenth International Congress on Large Dams, Montreal, Can, Vol 3, Quest No 38, p 7-18, June 1970. 12 p, 6 fig.

Descriptors: *Dams, *Instrumentation, Measurement, Damsites, *Concrete, Dams, Equipment, *Earth dams, Control, Settlement, Tiltmeters, *Surveys, Measuring instruments, Dam foundations.

The tendency to build larger dams at sites with complex and often difficult foundation conditions has produced the need for increased expenditure on the surveillance and checking of the completed structure. The measurements obtained, as well as indicating the security of the structure, can be used to determine the behavior of the construction materials. Many measuring instruments are necessary because a single instrument can only record the change in condition of a small portion of the dam. Assessing a large quantity of survey data to judge the behavior of the whole structure is necessary. Only the geodetic control of selected points, and in the case of concrete dams, the use of pendulums, allow the overall behavior of a dam to be checked in a relatively short time. For dams situated at high altitudes, it is not possible to make regular geodetic surveys throughout the whole year, and means were sought for making rapid but accurate partial surveys at certain times of the year. Three such methods dictated by local conditions are discussed, and details are given of the results obtained. (USBR)
W71-03742

SAFETY AND BEHAVIOUR OF CONCRETE DAMS. METHODS OF OBSERVATIONS AND ORGANIZATION,
A. U. Huggenberger.
Tenth International Congress on Large Dams, Montreal, Can, Vol 3, Quest No 38, p 169-178, June 1970. 10 p, 1 tab.

Descriptors: *Dams, Concretes, Safety factors, Design, *Concrete dams, Control, Model tests, Instrumentation, Measurement, Dam foundations, Dam failure, *Safety, Measuring instruments.

The methods of computation, the tests on models, the constant surveillance with adapted measurement instruments and procedures, the strict surveys of concrete, the observations of foundations, abutments, and basin slopes, the appropriate organization of all observations, and the critical judgment of all results enable the safety of a concrete dam to be judged and steps to be taken to avoid serious damage or the complete destruction of the structure, with its disastrous consequences. (USBR)

SOME UNUSUAL ASPECTS OF DAM SAFETY STUDIES IN WESTERN UNITED STATES,
Bechtel Corp., San Francisco, Calif.
K. V. Taylor.
10th International Congress on Large Dams, Montreal, Can, Vol 3, Quest No 38, p 465-487, June 1970. 23 p, 4 fig, 1 ref.

Descriptors: *Dams, *Safety, Earth dams, Concrete dams, Rockfill dams, Dam failure, Inspection, Hazards, Legal aspects, Dam foundations, Seepage, Deterioration, Spillway design flood, *Investigations.
Identifiers: Western United States, Deficiencies, Dam stability, Remedial treatment.

The shifting population distribution toward the west places greater emphasis in this area on the necessity for close inspection and safety investigation of dams, and particularly older dams, many of which were designed and constructed to standards that would be unacceptable now. The principal deficiencies generally are: inadequate spillways; insufficient stability if subjected to major seismic forces; foundation problems caused by extensive faulting, weak bedrocks, and loss of strength of materials when saturated; seepage and drainage problems; and poor quality construction materials, particularly concrete aggregates. Several examples of such conditions are discussed, findings from safety investigations are outlined, and remedial measures required to enhance the safety of the structures are described. The average cost of conducting a safety investigation is estimated to be about $15,000 to $20,000 for engineering, and a similar amount for field exploration. Some legal aspects of safety investigations are mentioned. (USBR)

BASIC CONSIDERATIONS OF WELL DESIGN,
Bureau of Reclamation, Denver, Colo.
T. Ahrens.
Water Well Journal, Vol 24, No 4, 5, 6, 8, p 45-50, 49-51, 47-51, 25-37, Apr, May, June, Aug, 1970. 17 p, 1 tab, 32 ref.

Descriptors: *Water wells, Design, Construct
Aquifers, Wells, Well screens, Well casings, T
ing, *Drilling, Drilling equipment, Grouting, Sh
stress, Corrosion, Groundwater, Economics, E
ciencies.
Identifiers: *Well logging, *Well yield, Gra
packs, Compressive stress, Sulfate-reducing b
teria.

Water well design is concerned with efficient us
the aquifer, reasonable life expectancy, and
operation and maintenance costs in conjunct
with the purpose of the installation and
economics involved. Wells of 150 gpm or mor
unconsolidated aquifers are discussed. Much in
mation presented is equally applicable to sma
wells and to wells in consolidated formations. P
holes, drilling specifications, well hydraulics,
casings, grouting, well screen slot sizes and mat
als, gravel packs, approaches to well developm
and well testing are discussed. The 100% effici
well will never be constructed, but there is
reason to accept wells with a specific capacity o
gpm when the aquifer is capable of 20 gpm.
perience shows that more efficient wells, while h
ing a higher initial cost, are not only less expen
to operate but are less subject to deterioration
failure, and have a longer effective life. (USBR)

ble tool method lends itself to development lures with more chances of success than by her method of similar expense. Cable tool normally does not include the use of mud or es and aquifers are less likely to be made im- us to any degree. A cable tool well finished in ck is quite often improved by simply pump- is cleans out the fines and cuttings which ave become lodged in the formation by action. Some rocks wells can be further ped by the use of a surge pressure block. A n be developed by two main methods-surg- compressed air. These are two types of surge rs with variations ranging from weighted with ring washers to rope-wound drill stems. eneral methods for developing wells with essed air are (1) backwashing and (2) open well surging. The principle of backwashing is to force water out of the well through the screen and into the formation by compressed airs. Open well surging with compressed air is capable of more vigorous application than the backwashing method. (Campbell-NWWA)

REVERT CUTS COSTS AND MAKES BETTER WELLS,
Universal Oil Products Co., St. Paul, Minn. Johnson Div.
F. F. Zdenek.
UOP Johnson Drillers Journal, Vol 41, No 6, p 1-3, November-December 1969. 3 fig, 2 ref.

Descriptors: *Drilling fluids, *Water wells, Rotary drilling.
Identifiers: *Revert, *Bentonite mud, Drilling efficiency.

Revert is a food-grade, organic material which makes a bright blue drilling fluid when mixed with water at a ratio of about 6 pounds per 100 gallons. After a certain period of time, the fluid reverts to the viscosity of water through enzymatic action. Being a low solid, self-destroying fluid, revert does not contaminate water-bearing sands with clay particles and can be removed completely from the well during development. When it is used as a drilling fluid, water wells have significantly higher yields than those drilled with conventional drilling mud. It reduces friction in the mud-circulating system. This, together with other characteristics, can mean cost savings in the overall drilling operation. Revert makes it possible to drill more holes faster, because it can reduce friction losses in the circulating system by as much as 40%. Penetration rates are increased, so larger, deeper holes can be drilled faster and cheaper. A few case histories are described. (Campbell-NWWA)

REVERSE ROTARY WELL CONSTRUCTION,
Illinois State Water Survey, Urbana.
Robert T. Sasman.
Public Works, Vol 88, No 4, p 117-118, April 1957.

Descriptors: *Drilling, *Rotary drilling, Water wells, Drilling equipment, Municipal wells, Illinois.
Identifiers: *Reverse-rotary drilling, High water productivity applications, Large-diameter wells, Gravel packing.

The construction, drilling and testing of a large diameter water well in Urbana, Illinois is discussed. Well was drilled using reverse hydraulic rotary method which requires a large volume of water to circulate between the supply pit and down the hole outside the drill stem. Water and drill cuttings are returned to surface by suction through drill stem which is one of the early successful attempts in using the reverse circulation method. (Campbell-NWWA)

CEMENTING WATER WELLS,
Halliburton Oil Well Cement Co., Houston, Tex.
B. D. Brown.
Public Works, Vol 90, No 9, p 99-100, September 1959. 2 fig.

Descriptors: *Cements, *Water wells, Casings, Construction equipment, Texas, Oil industry.
Identifiers: *Cementing water wells, *Isolation of producing zones, Yield stimulation, Protection of casing, Bentonite.

This article discusses the techniques and materials which will aid in obtaining maximum control of isolating the producing zones. Isolation is very desirable to protect water-bearing formations from contamination of less desirable strata or from the surface. The use of cementitious materials will provide the most effective means of obtaining this isolation, will permit techniques of stimulations requiring hydraulic pressure and fluids, and will help to protect casing against corrosive waters. The types of materials used to cement casings are many, all of which permit dry blending of several additives to meet specific well conditions. A new tool developed for the petroleum industry incorporates feastures which are compatible for water well completions. In operation of this tool, a special plug is dropped from the surface and, through application of pump pressure, sets the sealing element and opens circulating ports. Cement material is mixed and pumped into the casing, through the circulating ports and above the sealing element. The top cementing plug seats on a special sleeve and through the application of pressure closes the circulating ports. Continued application of pressure shears the pins permitting plugs and sleeve to be pumped out of tool which thereby eliminates a drilling-out operation. (Campbell-NWWA)

ASYMPTOTIC NONLINEAR WAVE MOTION OF A VISCOUS FLUID IN AN INCLINED CHANNEL OF ARBITRARY CROSS SECTION,
Wisconsin Univ., Madison. Mathematics Research Center.
M. C. Shen, and S. M. Shih.
Available from NTIS as AD-715 958, $3.00 in paper copy, $0.95 in microfiche. MRC Summary Technical Report No 1047, February 1970. 30 p, 2 fig, 18 ref. OWRR Project A-037-WIS (1); and U S Army, Contract No DA-31-124-ARO-D-462.

Descriptors: *Wave action (Water), *Channe FLOW, *Surface tension, *Dimensional analysis, *Viscosity, Flow.
Identifiers: Tractable asymptotic theory, Viscous fluid, Linear elliptic, Three dimensional, Multiple-parameter.

A tractable asymptotic theory is achieved for the study of three-dimensional nonlinear wave motion of an incompressible, viscous fluid with surface tension in an inclined channel of arbitrary cross section. The method developed here is based upon a multiple-parameter singular perturbation scheme within the framework of long-wave approximation. The nonlinear problem is reduced to a sequence of linear elliptic mixed boundary-value problems, which can be solved by means of standard methods. Their solutions are then used to determine the wave speed and evolution equations governing the nonlinear wave motion. The results obtained give a quantitative description of a three-dimensional bore structure in an inclined channel of arbitrary cross section, and critical Reynolds number is also defined as a criterion for the instability of the wave motion.
W71-03309

A STATISTICAL MODEL TO PREDICT THE TRANSIT CAPACITY OF SEAL-LEVEL CANALS,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
B. G. Stinson, J. W. Brown, and J. Harrison.
Sponsored by Atlantic-Pacific Interoceanic Canal Study Commission. U. S. Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Miscellaneous Paper H-69-12, December 1969. 19 p, 3 fig, 2 tab, 19 ref.

Descriptors: *Mathematical models, *Canals, Navigation, Ships.
Identifiers: *Statistical models, *Sea-level canals, *Transit capacities (Waterways).

The derivation and application of a statistical model in the form of an algebraic equation which predicts yearly capacities of sea-level canals are presented in this report. The equation considers only the following significant variables: canal geometry, ship mix, ship stopping distances, length

and number of convoys, desired maximum waiting time, and overall canal efficiency (to predict transiting at less than maximum capacity). A simple algebraic representation is particularly useful because it can be used for preliminary canal transit studies without the need for either sophisticated mathematics or digital computer facilities. After narrowing the number of technically and economically feasible alternatives with the canal transit equation, the remaining alternatives can be studies in more detail by other means. Because of time limitations on the study, the canal transit equation has not been tested against either known solutions or solutions given by the digital computer simulation derived as part of this study and described in U. S. Army Engineer Waterways Experiment Station Miscellaneous Paper H-69-10. (Stinson-WES)
W71-03319

BOUNDARY EFFECTS OF GRADED ROUGHNESS ELEMENTS IN TWO-DIMENSIONAL FLOW IN OPEN CHANNELS,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
B. J. Brown.
Sponsored by Assistant Secretary of the Army (R and D), Department of the Army. U.S. Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Miscellaneous Paper H-70-6, May 1970. 5 p, 1 fig, 2 pl, 22 tab.

Descriptors: *Open channel flow, *Roughness (Hydraulic), Riprap, *Bank protection.
Identifiers: *Boundary effects, *Two-dimensional flow.

Tests were made on crushed graded limestone simulating riprap protection in two-dimensional flow in a 48-ft-long tilting flume. Three stone gradations involving different stone size ranges were tested. The results indicate that the root-mean-square of the surface protrusions is a suitable parameter for defining surface effects of densely spaced graded roughness elements such as quarry riprap. The average velocity can be expressed by an equation. (Brown-WES)

W71-03325

EFFECTS OF PROPOSED ELIZABETH RIVER DIKE ON TIDES, CURRENTS, SALINITIES AND SHOALING; HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
R. A. Boland, and W. H. Bobb.
Sponsored by U. S. Army Engineer District, Norfolk, and Naval Facilities Engineering Command, Norfolk. U.S. Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Miscellaneous Paper H-69-13, December 1969. 5 p, 4 tab, 13 photo, 17 plates.

Descriptors: *Dikes, *Tides, *Currents (Water), *Salinity, *Shoals, *Hydraulic models.
Identifiers: *Elizabeth River.

Existing comprehensive fixed-bed model of James River was used to determine effects of the proposed Elizabeth River dike. Test results consist of measurements of tide heights, current velocities, salinities, and shoaling quantities. From these data it was concluded that the proposed dike had little effect on tides, currents, or salinities in the problem area. In the model, the major source of sediment moving to and depositing in the Elizabeth River channel was found to be the shallow-water area between the Craney Island disposal area and the Newport News Channel. If this area does, in fact, constitute the major source of Elizabeth River channel shoaling in the prototype, the annual shoaling rate in the channel will be greatly reduced by construction of the dike; and the shoaling in the slips will be increased slightly. It is recommended that consideration be given to radioisotope or other tracer techniques to determine the source of shoaling in the Elizabeth River channel, provided an analysis of benefits and costs indicates that construction of the dike would be economically feasible. (Boland-WES)
W71-03326

WATERHAMMER ANALYSIS BY THE METHOD OF CHARACTERISTICS,
Bologna Univ. (Italy).
G. Evangelisti.
L'Energ Elettrica, Vol 46, No 10, 11, 12, p 673-692, 759-771, 839-858, Oct/Nov/Dec 1969. 53 p, 64 fig, 155 ref.

Descriptors: *Water hammer, Digital computers, Fluid mechanics, Fluid flow, *Mathematical models, Fluid friction, Pipelines, Surge tanks, Flow diagrams, Computer programs, Bibliographies, Technology, Calculations, Hydraulics, Foreign research.
Identifiers: *Method of characteristics, Italy, Boundary conditions, Water column separation, Acceleration (Mechanical).

Water hammer problems are analyzed by using the method of characteristics in the theoretical investigation and in the numerical computation. Disturbed flow is considered, allowing for compressibility and fluid friction; pipes are considered as having a section with elastic characteristics. Hydraulic and mechanical systems placed at the ends of each pipe are considered as extremity conditions. Mathematical models are established and solved by computer programs that divide the numerical procedure into elementary subprograms. A method is given for using the stored subprograms in various combinations for solving specific problems. A review of actual cases illustrates the proposed technques and introduces some new formulation criteria. An extensive bibliography of 155 references on water hammer technology is given. (USBR)
W71-03357

HEAD LOSSES IN WYES AND MANIFOLDS,
British Columbia Univ., Vancouver.
E. Ruus.
Proc Amer Soc Civ Eng, J Hydraul Div, Vol 96, No HY3, p 593-608, Mar 1970. 16 p, 13 fig, 1 tab, 10 ref, 2 append.

Descriptors: *Head loss, Hydraulic models, Hydraulics, Pipe bends, *Pipe flow, Pipelines, Instrumentation, Manometers, Pressure head, Tie rods, Discharges, Foreign research, Test procedures, Analysis, Discharge measurement.
Identifiers: Test results, *Manifolds, *Wye branches, Bifurcations, Canada, Foreign testing, Accuracy, Velocity head.

Head loss coefficients are determined exper
tally for symmetrical and unsymmetrical
through 9 symmetrical conical and spherica
and manifolds. The diameters of the mai
branch pipes are 5-1/4 in. and 3-3/4 in. The
of bifurcation varies from 45 deg to 90 deg
conical wyes and manifolds are tested wit
without tie rods of 3/16, 3/8, 9/16, and 3/4 i
placed in turn at the center of the wye. The c
ters of the spheres of spherical wyes are 5.
and 7.50 in. Head loss depends on the an
bifurcation, the diameter of the tie rod
sphere, and the ratio between discharges
branch and main pipes. For symmetrical flo
ditions, the head losses caused by wy
manifolds with an angle of bifurcation not o
deg are less than 10% of the velocity head
main pipe. Tie rods increase head losses and
be avoided. (USBR)

EFFECT OF CHANNEL SHAPE ON GRADUALLY VARIED FLOW PROFILES,
Indian Inst. of Science, Bangalore. Dept. of Civil and Hydraulic Engineering.
Nagar S. Lakshmana Rao, and Kalambur Sridharan.
ASCE Proceedings, Journal of the Hydraulics Division, Vol 97, No HY1, Paper 7798, p 55-64, January 1971. 10 p, 6 fig, 4 ref, append.

Descriptors: *Open channel flow, *Channel morphology, *Flow profiles, Froude number, Flow rates, Regime, Canals, Alluvial channels, Stage-discharge relations.
Identifiers: Gradually varied flow.

Gradually varied flow profiles were analyzed with Froude number as a reference parameter. Generalized nondimensional varied flow profiles of the M and S types were computed for 56 channel shapes covering a wide range of rectangular, trapezoidal, triangular and parabolic channels. The computation results are presented in a summarized form taking the nondimensional profile length as the characteristic parameter. The effect of channel shape and Froude number on the varied flow profiles were studied. The figures presented can be used to obtain a rapid estimation of profile lengths for the channel shapes considered. (Knapp-USGS)

HYDRAULIC JUMP WITHIN GRADUALLY EXPANDING CHANNEL,
Asian Inst. of Technology, Bangkok (Thailand). Dept. of Hydraulic Engineering, and Mindanao Development Authority (Philippines).
Anat Arbhabhirama, and Alejandro U. Abella.
ASCE Proceedings, Journal of the Hydraulics Division, Vol 97, No HY1, Paper 7831, p 31-42, January 1971. 12 p, 9 fig, 4 ref, append.

Descriptors: *Hydraulic Jump, *Stilling basins, *Hydraulic models, Open channel flow, Energy dissipation, Model studies, Mathematical models, Critical flow, Supercritical flow, Uniform flow.
Identifiers: *Hydraulic jump (Expanding channel).

Expanding channel jump is considered to behave as a section of a circular jump. Equations describing the characteristics of the expanding channel jump are derived, using observations conducted with 6 different angles of divergence. The experimental results showed a close agreement with theoretical solutions. The general equation developed for the jump, with proper evaluation of the side pressure force effect, describes the phenomenon regardless of the angle of divergence. An empirical expression for approximating the location of the jump within the transition was also developed. (Knapp-USGS)

Identifiers: *Trapezoidal open channels.

A method for computing uniform flow in trapezoidal channels through the use of two graphs is presented. The first graph gives the relationships among slope, flow, area, and velocity, for a section whose hydraulic radius equals 0.328 of the sq root of cross-sectional area. The value of the coefficient of friction in Manning's formula is also included among the relationships. The second graph gives the effect of change in channel side slope, bottom width, and depth of water. This graph also shows directly the most economic channel sections. (Knapp-USGS)

HEAD LOSSES IN UNLINED ROCK TUNNELS,
Royal Inst. of Tech., Stockholm (Sweden).
E. Reinius.
Water Power, Vol 22, No 7/8, p 246-252, July/Aug 1970. 7 p, 16 fig, 5 tab, 18 ref.

Descriptors: *Tunnels, Tunnel design, *Tunnel hydraulics, *Head loss, Tunneling, Tunnel construction, *Roughness (Hydraulic), Bibliographies, Roughness coefficient, Test facilities, Friction, Laboratory tests, Rock mechanics, Discharges, Foreign research, Velocity, Fluid mechanics, Flow resistance, Hydraulics.
Identifiers: Tunnel supports, Foreign testing, Sweden, Test results, Friction factors, Friction coefficient (Hyd).

An investigation into the effects of roughness, driving direction, and reinforced portals on head loss in unlined hydraulic rock tunnels is described. The roughness of an unlined rock tunnel is influenced by: (1) the rock structure, (2) the advancing direction when excavating the tunnel, (3) the spacing of boreholes around the contour line of the tunnel, and (4) the blasting method. A test flume was used to study the influence of the orientation of the serrations and the wall surface roughness on the

friction factor. The orientation of the serrations had a pronounced influence on the frictional resistance to flow. A tunnel excavated with the advancing direction against that of the flow has a lower head loss than a tunnel excavated in the flow direction. The influence of local reinforcing members at weak parts of the tunnel on resistance to flow was investigated. Three types of arch ribs were tested; an arch rib with bevelled corners gave a much smaller resistance to flow than an arch rib with sharp corners. For a certain cross-sectional area of the rib, a low, wide cross section gives less head loss than a high, narrow section. Has 18 references. (USBR)

ENERGY DISSIPATION USING AIR INJECTION,
Nottingham Univ. (England).
N. Hay.
Paper Hydraul Div Spec Conf, Univ Minn, Minneapolis, Aug 1970. 16 p, 7 fig, 10 ref, 2 append.

Descriptors: Kinetic energy, Energy, *Energy dissipation, Hydraulics, Erosion, Hydraulic jump, *Fluid mechanics, *Aeration, Turbulence, Scour, Air entrainment, High pressure, Nappe, Foreign research, Model tests, *Flow, *Spillways, Air-water interfaces.
Identifiers: Great Britain.

A method of energy dissipation suitable for spillways in which air is introduced at the interface between the structure and the water nappe in the upper reaches of the structure is described and evaluated. Air induces turbulence in the stream, and kinetic energy is dissipated as it is generated. Literature on aerated flows supports the claims made for this method. Results of exploratory tests on a model spillway with air injection confirm that air injection reduces the energy at the foot of the spillway. A mean reduction nearing 50% was obtained in the model at an air concentration of 28%. The effect of air injection on the hydraulic jump at the foot of the spillway was beneficial because the jump was more stable and nearer to the foot of the spillway. (USBR)

INCREASING THE ACCURACY OF DESIGN CALCULATIONS FOR CRITICAL SPEEDS OF THE ROTOR OF A HYDRAULIC UNIT BY THE METHOD OF INITIAL PARAMETERS,
Bureau of Reclamation, Denver, Colo.
A. U. Bugov.
Translation of: Energomashinostrvenie No 11, p 6-10, 1964. Available from NTIS as PB-193 623T, $3.00 in paper copy, $0.95 in microfiche. Bureau of Reclamation Translation No 692, August 1967. 18 p, 3 tab, 7 ref.

Descriptors: Rotation, Rotating components, Turbine runners, Rigidity, *Vibrations, Mathematical analysis, Moments of inertia, *Critical speed, Shafts, Machinery, Generators, Hydraulic turbines, Structural analysis, Structural behavior, Machines, Differential equations, Elasticity, Flexible foundations, Boundary values, Eccentric loading, Stress.
Identifiers: Stators, *Rotors, USSR, *Machine design, Gyroscopic effects, Initial parameters method.

A method is presented for calculating critical speeds and constrained vibrations of the rotor of a hydraulic unit, considering the important structural parameters: elasticity of the support, gyroscopic effect of mass settlement, and variable rigidity of the rotor along its length. Design calculations for modern powerful hydraulic units, such as at Krasnoiarsk Powerplant in the USSR, should include these factors. The rotor is considered as a vibrating string with 2 or 3 seated masses along it, dividing it into several parts. A. N. Krylov's method of initial parameters can be used for calculating shafts on an elastic foundation and critical speeds of rotors. The method is equivalent to substituting a system of differential equations with constant coeffecients for different rotor parts for a differential equation with variable coefficients. The solution is written with the help of functions formed by normal fundamental systems. The initial parameters used values for weights, moments of inertia of the mass, and flexibility of the support. Examples of solutions are given and compared with results of calculations for critical speeds without considering these factors. If electronic computers are used, the functions can be calculated according to factorization formulas, containing 3 to 4 factors.

THE ELECTRIC RESEARCH COUNCIL'S UNDERGROUND TRANSMISSION R AND D PROGRAM,
Edison Electric Inst., New York.
G. E. Watkins.
Paper 2nd Annual Meeting, Int Elec Res Exch, Cannes, France, Sept 1970. 14 p, 1 tab.

Descriptors: Research and development, Electrical industries, Electric power, *Extra high voltage, Electric cables, *Transmission (Electrical), Technology, Capacitance, Electric insulation, Costs, Experimental data, Dielectrics, Cooling, Cryogenics, Superconductivity, Supercooling.
Identifiers: *High voltage, Electric Research Council, Pipe-type cables, Oil-filled cables, *Underground transmission lines.

The problems and costs of putting high-voltage transmission systems underground are very different from those of the routine underground distribution of energy at low voltages. The extensive underground transmission R and D program of the Electric Research Council (ERC) seeks to perfect existing cable technology and to develop new ways of conveying large blocks of electric energy underground. Projects in progress are directed at the immediate demand for expanded underground operation. The longer-term projects, with potential for greater overall return, are designed to resolve the difficult and exacting problems associated with providing tomorrow's huge amounts of electrical power to our cities. The day of simple, reliable, and economic transmission of great blocks of power for long distances underground is still in the future. Under the program of the ERC, all segments of the electric utility industry in the U.S. are supporting the research and development efforts necessary to ensure that proper technology will be available for satisfying the vast future demands for underground power transmission. Identifiers: *Nuclear power, Uranium, Plutonium, Fuel costs, *Breeder reactors, Boiling-water reactors, Liquid-metal-cooled reactor.

In many sections of the U S thermal nuclear reactors compete with coal-fired electric plants, but if nuclear plants are to achieve full potential, developing an economical fast breeder reactor will be necessary. Most nuclear powerplants in the U S are of the light-water variety. In many parts o U S the plants are competitive with plants bu coal, but the electricity generated will be costly in the future as uranium supplies depleted. A promising possible answer to the problem is the fast-neutron reactor, produces more fuel than it consumes. Such a should be a more efficient generator of electr producing less thermal pollution than a water- tor plant. Breeding the fuel to make the fast tors possible takes time; until more is known the performance of such reactors, final judg about the economic feasibility must continue withheld. (USBR)

PREVENTION OF CRACKING IN EARTH DAMS,
Bureau of Reclamation, Denver, Colo.
F. C. Walker.
Tenth International Congress on Large Dams, Montreal, Canada, Vol 1, Quest No 36, p 361-370, June 1970. 10 p.

Descriptors: Dams, *Earth dams, Dam design, *Cracking, *Cracks, Shear cracks, Dam foundations, Collapse, Safety, Corrections, Classification, Differential settlement, Stress, Slopes, Treatment, Displacements, Soil mechanics, Deformation, Remedies, Seepage.
Identifiers: Crack control, Construction control, Collapse phenomenon, Collapsing soils, Preventive maintenance, Slip planes.

Prevention of cracking in earth dams or correction of cracking that does occur requires a knowledge of the various conditions under which cracking happens. A classification system based on type of stress (tension, compression, or shear), surface slope (flat or steep), and stress-inducing agency (moisture change, temperature change, overloading, unloading, and differential loading) is examined for the circumstances under which cracking occurs. Seriousness of the effect of various types of cracking depends upon the critical engineering properties of the structure and foundation involved, and in consequence, whether prevention or corrective action is necessary. Preventative or corrective actions for each type listed in the classification system are described. Several case histories of rare or obscure situations that do not form a part of the usual experience of practicing engineers but that are of sufficient importance to require inclusion in any comprehensive consideration of the influence of cracking on earth dam design are presented. (USBR)
W71-03351

PRECOMPRESSION FOR IMPROVING FOUNDATION SOILS,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
S. J. Johnson.
Proc Amer Soc Civ Eng, J Soil Mech Found Div, Vol 96, No SM1, p 111-144, Jan 1970. 34 p, 27 fig, 2 tab, 52 ref, 3 append.

Descriptors: *Preconsolidation, Embankments, Fills, *Foundations, Soil stabilization, Settlement (Structural), *Soil mechanics, Bibliographies, Loose soils, Design, Compression, Consolidation, Analytical techniques, Relief wells, Drains, Pore pressure, Pore water pressures, Safety factors.
Identifiers: *Preloading, Compressible foundation, Compressible soils, Secondary consolidation, Surcharge.

Precompression of weak and compressible subsoils (with or without vertical sand drains to accelerate consolidation) to increase strength and decrease postconstruction settlements to tolerable amounts is discussed with references to uses and design procedures. Precompression is an effective way of eliminating, in advance of construction of structures or roads, primary consolidation and a portion of secondary compression that would otherwise occur. The amount of secondary compression that is avoided by precompression can be estimated reasonably well, and the surcharge fill can be designed to reduce the remaining secondary compression settlements to tolerable amounts. Design procedures for minimizing secondary compression effects are presented. (USBR)
W71-03355

FOUNDATION PRECOMPRESSION WITH VERTICLE SAND DRAINS,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
S. J. Johnson.
Proc Amer Soc Civ Eng, J Soil Mech Found Div, Vol 96, No SM1, p 145-175, Jan 1970. 31 p, 30 fig, 2 tab, 44 ref, 2 append.

Descriptors: *Preconsolidation, Compression, Consolidation, *Sand drains, *Vertical drains, Settlement (Structural), Drainage wells, Soil mechanics, Soil stabilization, *Foundations, Loose soils, Drainage, Pore pressure, Relief wells, Foundation investigations, Design, Installation, Bibliographies.
Identifiers: *Preloading, Compressible foundation, Surcharge, Secondary consolidation, Construction methods, Construction control.

Foundation precompression using preload fills combined with vertical sand drains to accelerate consolidation is described. Uses, design procedures, and possible effects of alternative methods for installing vertical sand drains are discussed. Vertical sand drains to accelerate consolidation are probably not required in soils containing continuous intermediate sand layers within the compressible stratum, but pressure-relief wells may be required to reduce excess pore-water pressures in the sand layers. Pressure-relief wells can be sand drains, free-flowing wellpoints, or conventional wells. Vertical sand drains will probably serve no purpose where design loadings will not exceed preconsolidation stresses. Field tests may be required in some stratified materials to evaluate the drainage efficacy of thin layers of pervious soils. The importance of designing for secondary compression effects is emphasized. (USBR)

SOME LOADING TEST ON LONG PIPE PILES,
Golder, Brawner and Associates Ltd., Vancouver (British Columbia).
N. R. McCammon, and H. Q. Golder.
Geotech, Vol 20, No 2, p 171-184, June 1970. 14 p, 10 fig, 3 tab, 7 ref.

Descriptors: Pile driving, *Skin friction, *Piles (Foundations), *Pile friction, Cohesive soils, Cohesionless soils, *Steel piles, Time, Pipes, *Pile bearing capacities, Pile foundations.
Identifiers: Loading tests, *Pile tests.

Two 24-in.-dia steel pipe piles were driven, one into granular and the other into cohesive soil, and test loaded to measure separately the skin friction and end-bearing components of the pile capacity. The paper describes the tests and presents the pertinent geotechnical properties of the subsoil at each test pile. The values of skin friction and end-bearing are reported. The pile driven into the cohesive soil was test loaded at various times after driving to determine any change in pile capacity with time. A FEATURE OF THE SITE WAS THE PRESENCE OF ARTESIAN WATER PRESSURES IN THE SOIL. The computed and measured values of pile capacity are compared. The skin friction and end-bearing values determined in the tests are used to estimate the bearing capacity of 60-in.-dia steel pipe piles to be driven at the site. (USBR)

THE DYNAMIC PENETRATION TEST: A STANDARD THAT IS NOT STANDARDIZED,
Illinois Univ., Urbana; La Plata Univ. (Argentina); and Sao Paulo Univ. (Brazil).
H. O. Ireland, O. Moretto, and M. Vargas.
Geotechnique, Vol 20, No 2, p 185-192, June 1970. 8 p, 4 fig, 4 ref.

Descriptors: Test procedures, Errors, Drilling, Sampling, Equipment, *Pentration tests, Penetration resistance, Soil mechanics, Samplers, *Soil tests, Soil dynamics, Foundation investigations.
Identifiers: Dynamic tests, Site selection.

A description and a discussion of the technique of making the so-called standard penetration test used in North and South America are presented. Dynamic penetration tests such as the SPT are used for obtaining results that can be interpreted by engineers on a universal basis, but results are often a compromise because of details in the test procedure. The testers usually change the procedure of the test or the dimensions of the tools and continue to call it standard, apparently not realizing that changes cause variations in the penetration resistance number N. To consider the various implications of the method properly, a procedure for boring, sounding, and sampling is described; the SPT in its original form is described; as examples of variations, 2 modified and improved samplers and test procedures used in South America are mentioned; and the applicability and scope of the test are discussed. AN INVESTIGATION OF A CONE-PENETROMETER METHOD FOR THE DETERMINATION OF THE LIQUID LIMIT,
Road Research Lab., Crowthorne (England).
P. T. Sherwood, and M. D. Ryley.
Geotechnique, Vol 20, No 2, p 203-208, June 1970. 8 p, 5 fig, 3 tab, 13 ref.

Descriptors: Atterberg limits, Test procedures, Errors, Apparatus, *Liquid limits, *Penetrometers, *Soil tests, Soil mechanics, Soil physical properties.
Identifiers: Cone penetrometer test.

Recent investigations in the U K and in the U S show that results of the liquid limit test made with the Casagrande apparatus might give wide variations when results obtained by different laboratories are compared. The U S Road Research Laboratory has undertaken an examination of methods of reducing this variation. One possibility is that much of the variation is inherent in the Casagrande apparatus; one suggestion was that the Casagrande test should be replaced by one of the many conepenetrometer methods used in many countries. This paper describes an investigation to determine if one of the cone-penetrometer methods would be an acceptable alternative to the Casagrande test. (USBR)

ANALYSIS OF PILE GROUP BEHAVIOR,
Materials Research and Development,
Oakland, Calif; Ohio State Univ., Columbus
Dames and Moore, San Francisco, Calif.
K. Nair, H. Gray, and N. C. Donovan.
Amer Soc Test Mater Spec Tech Publ 444, p
159, 1969. 42 p, 16 fig, 6 tab, 13 ref, append.

Descriptors: *Pile groups, Batter piles, Horiz
loads, Analysis, Deformation, Bending mon
Stress, Theoretical analysis, Settlement, *Fou
tions, *Pile foundations, Pile friction, Pile l
loads, *Piles (Foundations), Computer
gramming.
Identifiers: Pile tests, Computer applications.

A procedure for the 3-dimensional analysis o
groups subject to horizontal and vertical force
moments which accounts for batter piles, the l
ral resistance of the piles, and the lateral resis
of the surrounding soil is discussed. Because o
extensive amount of computational effort req
to analyze a pile group, the analysis was
grammed for a digital computer. Results obt

nalyzing several pile group arrangements for
s soil and loading conditions include the axial
moments, stresses, and deflections for in-
l piles and for group piles. Numerical results
he significant influence that the following
have on loads that are introduced in the
individual piles: (1) the arrangement of the
ual piles within the group, (2) the end condi-
reflected by the connection between the pile
d the piles, (3) the lateral resistance of the
nding soil, and (4) the flexural resistance of
e. Comparing field and laboratory tests in-
that the behavior of pile groups predicted
analysis is in qualitative agreement with ob-
behavior. (USBR)

tors: *Foundations, *Excavation, Failures,
actors, Soil mechanics, Statistical analysis,
Loads (Forces), Soil properties.
ers: Empirical methods.

ety design and safety factor in excavations
ndations are discussed. The resistance to
is provided by an assemblage or system of
al components. Three approaches are
ed: (1) statistical analysis, (2) the com-
approach, and (3) the empirical approach.
tical analysis becomes unreliable at the ex-
low probabilities that must be considered
n. The component approach uses varying
actors to be applied to the loads acting on
cture as well as to the various soil properties
analysis. Safety factors are also applied to
ponents of soil strength individually. This
h is judged sound, but additional com-
of the safety factor are necessary because
ncertainties in the accuracy of the engineer-
ysis used. The empirical approach is that of
ll safety factor developed from experience.
se of the empirical approach requires that
a full study of all failures that occur so that
ce of error can be pinpointed and the un-
es involved in loading, evaluation of re-
s, and engineering analysis can be
ed. (USBR)

ions involving earth pressures, the con-
n of a somewhat simplified stress system is
enable the interrelation between the ac-
passive stresses to be seen and to provide a
basis for the use of engineering judgment
he particular excavation will behave. The
of this paper is on understanding the
of clay soils in normally consolidated and
solidated conditions. Changes in stability
d with the dissipation of excess pore water
set up during construction are discussed.
cases, the original deposits of normally
ated clays have been uplifted and sub-
the processes of erosion which have
many hundred or even thousands of feet
of the overlying sediments. Vertical effective stresses have been reduced, swelling in the vertical direction has taken place, and lateral stresses have changed. Heavily overconsolidated clays may be at or near a state of passive failure at shallow depths. Shear zones, in which the strength is lower than in the intact clay, may have been created. The existence of these shear zones may be important in lateral stress problems. Has 32 references. (USBR)

BRACED EXCAVATIONS,
Massachusetts Inst. of Tech., Cambridge.
T. W. Lambe, and E. K. Turner.
1970 Special Conference on Lateral Stresses Ground Design Earth-Retaining Structures, Cornell Univ, Ithaca, N Y, p 149-218, June 1970. 70 p, 43 fig, 1 tab, 27 ref, append.

Descriptors: Bracings, Excavation, *Analytical techniques, Field data, Reviews, Soil mechanics, Design, *Lateral forces, *Earth pressure, Earth movements, Soil pressure, Pore water pressures, Stress, Trenches, *Cuts, Strain Loads (Forces), Supports, Bibliographies, *Retaining walls, Load distribution, Settlement (Structural), Movement, Performance.
Identifiers: Design practices.

This review of the state-of-the-art of braced excavations includes: (1) an overview of the excavation problem and factors that influence the behavior of an excavation; (2) several key fundamentals that are widely misunderstood or ignored; (3) predictions of performance of 3 excavations by several analytical techniques, and comparisons of measured field performance to the predictions; and (4) a proposed step-by-step approach to the engineering of a braced excavation. Various methods of analysis are discussed and evaluated. Field measurements and analysis of the 3 excavations showed that: (1) pore pressures were far below static values; (2) steady-state seepage analysis gave reasonable predictions of pore water pressures; (3) bracing strut loads varied widely; (4) significant movements occurred below the bottom of the excavations; (5) much smaller movements occurred behind the reinforced concrete wall than behind the sheet pile walls; (6) significant settlements occurred far back from the excavation; and (7) a significant portion of the settlement can be attributed to consolidation settlement. The general conclusion is that strut loads and movements of soil outside an open excavation cannot be predicted with confidence using present methods of analysis. (USBR)

DESIGN OF EARTH RETAINING STRUCTURES FOR DYNAMIC LOADS,
California Univ, Berkeley; and Massachusetts Inst. of Tech., Cambridge.
H. B. Seed, and R. V. Whitman.
1970 Special Conference on Lateral Stresses Ground Design Earth-Retaining Structures, Cornell Univ, Ithaca, N Y, p 103-147, June 1970. 45 p, 32 fig, 5 tab, 31 ref.

Descriptors: Earthquakes, *Retaining walls, Design, Model tests, Water pressure, Design criteria, Soil mechanics, *Lateral forces, Blasts, Soil pressure, Explosions, Failure (Mechanics), Analytical techniques, Safety factors, Bibliographies, Live loads, Reviews.
Identifiers: Earthquake damage, *Dynamic loads, Dynamic tests, Seismic stability, Design practices, Recommendations, *Earthquake loads.

A review of the state of knowledge concerning the design of earth-retaining structures for increased lateral pressures caused by earthquakes, explosions, or blasts is presented. The general practice in the U S and many other countries is to make no special allowance for dynamic loads caused by earthquakes. Several failures are cited to show that increased lateral pressure must be considered a significant design problem in seismic regions. Methods for determining dynamic lateral pressures on retaining structures above and below the water table are reviewed, and recommendations for earthquake-resistant design are presented. The design of structures for protection against explosions and the maximum accelerations allowed to avoid damage to retaining walls and freshly placed concrete from nearby blasting are discussed. (USBR)
W71-03749

ABOUT THE SAFETY FROM SUBSURFACE EROSION OF EARTH DAMS SUBJECTED TO UNDERSEEPAGE,
Technische Hochschule, Darmstadt (West Germany).
H. Breth, and K. Gunther.
10th International Congress on Large Dams, Montreal, Can, Vol 2, Quest No 37, p 431-451, June 1970. 21 p, 9 fig, 24 ref.

Descriptors: Seepage, *Underseepage, Safety, Dams, *Earth dams, Dam design, Uplift pressure, Dam foundations, Pervious soils, Subsurface flow, Soil mechanics, Blowouts, Analytical techniques, Sand boils, Heaving, Percolation, Foreign research, Foundation failure, Bibliographies.
Identifiers: Seepage control, Design practices, *Piping (Erosion), German Federal Republic.

The potential theory method and Lane's method of assessing the safety from subsurface erosion of dams subjected to underseepage are compared, and the practicability and limits of applicability are investigated. Lane's method can lead to dangerously inaccurate estimates of the safety of dams founded on stratified subsoil and to extremely uneconomical designs, especially when a large head difference exists between the upstream and downstream sides of the dam and when filter layers or drainage systems are provided. The potential theory method in some cases gives criteria causing difficulties and uncertainties in estimating safety from erosion, but experience shows that the method leads to economical designs safe from subsurface erosion when applied with care. Lane's method should be used only for small dams founded on largely homogeneous soils; the potential theory method should be used for all other cases. (USBR)

NEW TECHNIQUE OF SLUICING SCREENED STONES WITH SAND AND LOAM AS PERFORMED IN THE HIGH ASWAN DAM,
Aswan High Dam (United Arab Republic). Technical Research Dept.
M. E. Hassouna, W. K. Shenouda, and K. Nashed.
10th International Congress on Large Dams, Montreal, Can, Vol 2, Quest No 37, p 777-792, June 1970. 16 p, 9 fig.

Descriptors: Construction, *Rock fills, *Rockfill dams, Voids, Earth dams, Testing, Foreign construction, Underwater construction, Quality control, Cofferdams, Screening, Hydraulic transportation, *Hydraulic fills, Dam construction, Gradation, River closures.
Identifiers: Aswan Dam, UAR (United Arab Republic, Construction control, Construction methods, *Sluicing.

Sluicing with sand, delivered in the form of a hydraulic pulp, to fill the voids of rockfill in the High Aswan Dam in the United Arab Republic is described. Sluicing was successful above and below water and was performed to: (1) decrease seepage through the dam, (2) avoid piping, and (3) eliminate the need for constructing an inverted filter in deep flowing water. Studies to furnish data about the nature of sluicing, factors affecting the process, methods of delivery of sand, optimum gradation of rockfill, and efficiency of the sluicing method are discussed. Construction control procedures are described. Screening of the rockfill materials to be sluiced was necessary for successful void filling. (USBR)

FILLING AND COMPACTION OF SAND BY DEEP VIBRATORS AND VIBROROLLERS IN THE HIGH ASWAN DAM,
High Aswan Dam (United Arab Republic). Technical Research Dept.
M. E. Hassouna, and W. K. Shenouda.
10th International Congress on Large Dams, Montreal, Can, Vol 5, Gen Rep, p 411-432, June 1970. 22 p, 12 fig.

Descriptors: *Earth dams, *Compaction, Compaction equipment, Dune sands, Compaction tests, *Hydraulic-fill dams, Hydraulic fills, Density, Penetration resistance, Penetration tests, Penetrometers, Field tests, Dam construction, Foreign construction, Dam design, Quality control, Hydraulic transportation, Soil compaction.
Identifiers: *Vibratory compaction, United Arab Republic, Aswan Dam, UAR, Permeability tests, Construction methods.

In constructing the High Aswan Dam in the United Arab Republic, a technique of hydralically placing dune sand on both sides of a clay core and compacting it with deep vibrators or vibrorollers was used successfully and economically. The first part of the fill was placed under water at a depth of up to 35 m in 2 layers each 14-15 m thick. The underwater part of the fill was compacted, using deep vibrators working from floating rigs, to a depth of 15 m under a water depth of up to 19 m. Deep vibrators and methods used to compact 3,400,000 cu m of dune-sandfill in a 4-mo period are described. That part of the fill above the water surface was hydraulically placed in layers 1.5-2.0 m thick and compacted with vibrorollers. Methods of measuring compaction in the underwater zone and the dry zone of the dam are discussed. (USBR)

FOUNDATION INSTRUMENTATION AT PLEASANT VALLEY PUMPING PLANT,
Bureau of Reclamation, Denver, Colo. Office of Chief Engineer.
William H. Roth.
Available from NTIS as PB-195 272, $3.00 in paper copy, $0.95 in microfiche. Bureau of Reclamation Report REC-OCE-70-23, June 1970. 32 p, 24 fig, 2 tab, 1 ref.

Descriptors: Instrumentation, *Foundations, Stress concentration, Pore pressure, Stress distribution, *Earth pressure, *Uplift pressure, Walls, Pore water pressures, Flow nets, Structural stability, Performance, Land subsidence, Stability analysis, Field data, *Piezometers, *Drains, *Soil pressure, Lateral forces, Settlement (Structural), Safety factors, California.
Identifiers: Pleasant Valley Pumping Plant (Calif), Stress gages, Deep subsidence, *Stress meters.

Stress meters and piezometers were installed at Pleasant Valley pumping plant in California to record soil and pore pressures underneath and along the back wall of the structure and to monitor functioning of a drain that was constructed along the base of the back wall to reduce uplift pressure under the structure and horizontal pressure on the wall. Included in the report are: (1) a discussion of conditions prompting the drain and instrumentation installation; (2) drawings showing features of the pumping plant and pumping plant excavation; (3) drawings showing locations and details of installation of the stress meters and piezometers; (4) logs of drill holes showing foundation conditions; (5) a description and drawings showing results of an electrical analogy tray study to determine the flow net for the high cut slope adjacent to the pumping plant; (6) a discussion and drawings showing results of stability studies made for the structure; (7) plots showing stress meter and piezometer reading through Feb 2 and Feb 12, 1970, respectively; (8) plots of wall pressures determined from the stress meter readings; and (9) a discussion of unexpected stress meter and piezometer readings and possible explanations.

Water Power, Vol 22, No 5/6, 7/8, p 203-209, 253-259, May/June, July/Aug 1970. 14 p, 25 fig, 3 tab, 58 ref.

Descriptors: *Rock mechanics, Rock foundations, Rock properties, Dams, *Rockslides, *Concrete dams, *Dam foundations, *Dam failure, Dam design, Engineering geology, Engineering, Uplift pressure, Hydrostatic pressure, Grout curtains, Laboratory tests, Analytical techniques, Bibliographies, Fractures (Geology), Strength, Slope stability, Safety.
Identifiers: Rockfalls, *Rock slope stability, Rock tests, Malpasset Dam, France, In situ tests, Vaiont Slide, Italy, Dam stability.

Rock conditions, methods used for testing rock, and choice of solutions of problems for several concrete dams are described to show to what extent known methods of rock mechanics can be used in solving engineering problems and to what extent present knowledge of rock properties is lacking and insufficient for clear technical decisions. Some proposed changes in the treatment of foundations for concrete dams, methods of analysis of galleries and excavations in rock, rock slope stability, and several major rockslides are discussed. Analysis of conditions leading to the Malpasset Dam failure in France and to the Vaiont rockslide in Italy are given special attention. Has 58 references. (USBR)

CONCRETE BEAMS WITH PRESTRESSED REINFORCEMENT,
Ohio State Univ., Columbus.
A. Bishara, and F. N. Almeida.
Proc Amer Soc Civ Eng, J Struct Div, Vol 96, No ST7, p 1445-1460, July 1970. 16 p, 5 fig, 4 tab, 10 ref, 2 append.

Descriptors: *Beams (Structural), *Reinforced concrete, Reinforcement, Prestressed concrete, Precast concrete, Cracking, Deflection, Moments, Structural behavior, Structural members, Analytical techniques, Strain, Elasticity modulus, Laboratory tests, Structural engineering.
Identifiers: Reinforcing materials, Composite systems, *Composite beams, Strain hardening, Ultimate strength.

Test on 6 rectangular beams reinforced with variable amounts of deformed steel bars and precast prestressed concrete prisms are reported. Methods are suggested for computing the moment causing cracking of in situ concrete and that causing cracking of prestressed reinforcement. After cracking of prestressed reinforcement, and up to the beginning of yield of nonprestressed tension reinforcement, flexural analysis can be done using assumptions of classic working stress design by associating to the combined area of strand and deformed bars a pseudo-modulus of elasticity higher than that of ordinary steel. During this stage for similar beams having equal total areas of tension reinforcement, the ratio between their maximum crack widths was practically equal to the inverse of their respective pseudo-moduli. Strain hardening effects should be taken into consideration in estimating ultimate moment capacity of beams reinforced with such composite reinforcement. (USBR)

Identifiers: *Epoxy mortar, Creep tests, G Britain, Test results, Foreign testing, Fatigue tes

Formulation of an epoxy mortar intended for us structural joints is discussed with relation to re work on mix design. Results of extensive tests creep and ultimate strength show that the ep mortar is suitable for use in structural joints precast concrete that transmit combined shear compression, and that its flexibility and creep little greater than that of concrete. Resin mo mixes are discussed, with particular emphasis Mix M used in the tests described. Conclusions that concrete structures containing joints m with an epoxy mortar similar to that tested may designed as if they were monolithic. (USBR)

ts of an investigation to determine the effect
cimen size on tensile strength of concrete are presented. Direct-tension, ring-tension, and splitting-tension tests were used during the investigation. Twenty-one concrete mixes were prepared, and 6- and 12-in.-dia rings and 4- by 8-in. and 6- by 12-in. cylinders were cast and tested. Analysis of test results from 276 specimens showed that irrespective of the test method used, tensile strength values decreased with increase in size of the specimens. The average decrease in strength varied from about 14% in the ring-tension test to about 7% in the direct-tension and splitting-tension tests. (USBR)

DEVELOPMENT OF A STRESS RELIEF METHOD WITH A THREE-DIRECTIONAL BOREHOLE DEFORMATOPM GAGE,
Bureau of Reclamation, Denver, Colo. Engineering and Research Center.
W. G. Austin.
Bureau of Reclamation Report REC-OCE-70-10, Mar 1970. 74 p, 51 fig, 17 tab, 5 ref, append.

Descriptors: Concrete testing, Laboratory tests, Cores, Mass concrete, Elasticity modulus, *Internal forces, *Stress relieving, Deformation, Rock mechanics, Three-dimensional, *Drill holes, *Strain measurement, Core drilling, Boreholes, Research and development, Test procedures, Testing, *Stress, Strain, Analytical techniques, Orientation.
Identifiers: In situ tests, Rock tests, *Borehole deformation gage, *Overcoring method, Testing equipment, *Internal stress.

Laboratory tests and analysis were performed to develop testing techniques and to check a method for determing in situ stress in an isotropic elastic body described in a Bureau of Mines report. The method is based on measuring the diametrical change in a borehole caused by overcoring with a larger-diameter bit, and indicates that measurements in 2 nonparallel, nonperpendicular drill holes are sufficient to determine all 6 components of 3-dimensional stress. Necessary equipment was fabricated, calculations for the 2-drill hole approach were programed for computer analysis, and stress relief tests were performed on 3 biaxially loaded concrete blocks. Test results were analyzed, but solutions were unobtainable. Further study indicated that 3 drill holes are required to obtain solutions. A computer program was prepared for determining stresses for 3 or more drill holes, additional stress relief tests were performed using 3 drill holes, and satisfactory solutions were obtained. Conclusions are: (1) 3 nonparallel drill holes are required to obtain a 3-dimensional stress solution; (2) the stress-relief method using the borehole gage requires complex and precise procedures; and (3) the method is suitable for obtaining stresses in large masses. PREVENTING FILAMENTOUS SCALE IN WATER WELLS,
Sayreville Water Works, N.J.
Andrew Piatek.
Water and Wastes Engineering, Vol 4, No 12, p 54-55, December 1967. 9 ref.

Descriptors: *Water wells, *Corrosion, *Iron removal, Well maintenance, Crenothrix, Scale, Colloidal clay.
Identifiers: *Water well chemical treatment, Gallionella sp., Beggiatoa sp., Leptothrix sp., Chlorine dioxide treatment, Calcium hypochlorite, Well surging, Well cleaning, Line cleaning.

Systems of chemical treatment for preventing formation of filamentous scale in well water containing iron bacteria and colloidal clay are reviewed. Laboratory experiments indicate that chlorine dioxide has ability to destroy iron bacteria. The water from wells in the Sayreville, New Jersey area was higher in colloidal clay at certain times than at others. It was assumed that the problem was complicated by iron bacteria using clay as a nucleus to aggregate with other insoluble salts in the formation and by rapid growth of the heavy muck in the system. The treatment was divided into two parts: (1) well surging and cleaning, and (2) line cleaning. The system of treatment has been successful for a year. It also appears that corrosion is being held at a lower level. (Campbell-NWWA)

PERFORMANCE OF ALLOYS AGAINST EROSION - CORROSION ATTACK,
Stainless Foundry and Engineering, Inc., Milwaukee, Wis.
G. Schiefelbein.
Materials Protection, Vol 9, No 6, p 11-13, June 1970. 4 fig, 6 tab, 1 ref.

Descriptors: *Pumps, *Corrosion, Pitting (Corrosion), Chemical degradation.
Identifiers: *Alloy performance, *Erosion-corrosion measurements, Illium PD, Illium 98, CN-7M (Alloy 20), Sulfite processing, Pump repair, Pulp and paper industry, Impeller failure.

The high frequency of pump repair and replacement in the pulp and paper industry prompted a research program to develop an alloy that would resist the attack of abrasive slurries in corrosive media. The comparative performance of alloys commonly used in paper mills is described. According to field test results, Illium PD extended pump life to nearly two years, compared with five months obtained from the commonly used modified CN-7M alloy. (Campbell-NWWA)
W71-03838

SECOND CORROSION STUDY OF PIPE EXPOSED TO DOMESTIC WATERS,
G. B. Hatch, J. F. J. Thomas, and R. W. Lane.
Materials Protection, Vol 9, No 6, p 34-37, June 1970. 3 fig, 3 ref.

Descriptors: *Water wells, *Corrosion, Pitting (Corrosion), Aluminum, Chemical degradation, Water supply.
Identifiers: Domestic water, Pipe exposure study, Galvanized steel, Galvanized wrought iron pipe, Alclad, Water type, Flow velocities, Test installations, Cold water, Copper, Chloride, pH, CaCo3.

An earlier pipe exposure study to establish the corrosivity of several public water supplies to metal ordinarily used for domestic and institutional service pipe demonstrated the need for further study of the factors of quantity and velocity of water flow. Galvanized steel and galvanized wrought iron-pipe were tested under varied controlled and metered flow conditions at cold water temperature for the same 24 hour period as in the earlier study. Alclad and aluminum specimens were also tested. This report concerns the investigation of corrosion by 25 selected types of domestic waters only, with no attempt to cover all domestic waters. The following conclusions were made: (1) specimen types were equal in corrosion resistance to cold water, (2) copper and chloride are the predominant factors causing increased corrosion of the galvanized metals, (3) major problems of this study was experiment duration. Extended durations needed, (4) total flow and velocity factors did not reveal much additional information. However, specimens exposed to intermittent and lower flow rates were more severely corroded, (5) In the case of Alclad and aluminum, dissolved oxygen, copper and chloride were factors which appeared responsible for increased corrosion, except at higher velocities, (6) completely softened (zeolite treated) water, increased corrosion of all metals tested, (7) silicate treatment (8ppmSio2) of high chloride-sulfate water was successful for inhibition. (Campbell-NWWA)

9C. Research Facilities

A WATER RESOURCES ECOLOGY CAPABILITY FOR THE WATERWAYS EXPERIMENT STATION AND CORPS OF ENGINEERS,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
J. Cairns, and P. S. Humphrey.
Sponsored by Assistant Secretary of the Army (R and D), Department of the Army. U. S. Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Contract Report 0-69-1, May 1969. 26 p.

Descriptors: *Ecology, *Research facilities, *Ecosystems.

Reports Waterways Experiment Station capability for filling the existing need for a government agency which can study drainage basins, estuaries, shorelines and bays from the ecological systems viewpoint and provide regional planners with the ecological information which will enable them to plan wisely for the optimization of the resource from the multiple use standpoint. Defines areas of ecological programs. Shows relation of WES ecology capability to planning and implementation of civil projects. Recommends establishment at WES of a water resources ecology study group, formation of a Water Resources Ecology Advisory Board, and selection of a pilot project. (Spivey-WES)

10. SCIENTIFIC AND TECHNICAL INFORMATION

A STUDY OF WATER RESOURCES INFORMATION SERVICES,
Texas A and M Univ., College Station. Coll. of Business Administration.
Eugene B. Smith.
Water Resources Bulletin, Vol 6, No 6, p 907-919, November-December 1970. 13 p, 7 fig, 2 ref. OWRR Project W-103 (No 1609) (5).

Descriptors: *Abstracts, *Information retrieval, *Evaluation, Documentation, Publications, Libraries, Reviews, Surveys.
Identifiers: *Information services.

A study was designed to analyze two types of information services provided by the Water Resources Scientific Information Center (WRSIC). This study was conducted to assess the monetary value and acceptability to users of the Selected Water Resources Abstracts (SWRA) Journal and the Selective Dissemination of Information (SDI) System. Both services were well received and provide a useful and valuable service to a variety of users active in the area of water resources. Major limiting factors associated with the conduct of th study were those involving limited user experienc with the services and the absence of a capability t group the participants according to variou parameters. The SDI service was discontinued dur ing August, 1969 because of budgetary limitations The results of this study indicate that consideratio should be given to resumption of this service whe funding permits. Additional consideration shoul be given to the problem of document acquisition b the user. (Knapp-USGS)

NATURAL RESOURCES IN THE GOVERNMENTAL PROCESS A BIBLIOGRAPHY SELECTED AND ANNOTATED,
W71-03804 06E

BIOASSAY
TOXICITIES OF SOME HERBICIDES TO SIX SPECIES OF FRESHWATER CRUSTACEANS,
W71-03371 05C

BIOCHEMICAL OXYGEN DEMAND
AEROBIC DIGESTION OF CATTLE WASTE,
W71-03576 05D

BIOCLIMATOLOGY
CLIMATE, PESTS AND AGRICULTURE,
W71-03347 03F

WEATHER AND PLANT DISEASE FORECASTING,
W71-03348 03F

BIODEGRADABLE DETERGENTS
EFFECT OF SODIUM CHLORIDE AND SODIUM SULFATE ON SLUDGE DIGESTION,
W71-03452 05D

BIODEGRADATION
MINERALIZATION PROCESS OF ORGANIC MATTER IN LAKE WATER,
W71-03435 05C

BIOLOGICAL COMMUNITIES
PRELIMINARY RECONNAISSANCE OF AREAS TO BE IMPOUNDED IN THE SALT RIVER BASIN OF KENTUCKY,
W71-03315 02I

VEGETATION OF THE ERER-GOTA PLAIN, ETHIOPIA,
W71-03336 02I

BIOLOGICAL EFFECTS
FUTURE USE OF THE CHESAPEAKE BAY FOR COOLING THERMAL DISCHARGES,
W71-03479 05C

BIOLOGICAL OXIDATION
A DISCUSSION OF 'CONCEPTIONS AND MISCONCEPTIONS IN BIOLOGICAL OXIDATION,'
W71-03816 05D

BIOLOGICAL PROPERTIES
SWINE WASTE MANAGEMENT - PROPERTIES OF SWINE WASTES,
W71-03588 05A

BIOLOGICAL TREATMENT
THE CONCEPTUAL DESIGN OF AN ECONOMICALLY FEASIBLE ANIMAL WASTE DISPOSAL SCHEME,
W71-03546 05D

PRELIMINARY RESULTS OF A NOVEL BIOLOGICAL PROCESS FOR TREATING DAIRY WASTES,
W71-03568 05D

A DISCUSSION OF 'CONCEPTIONS AND MISCONCEPTIONS IN BIOLOGICAL OXIDATION,'
W71-03816 05D

BIOMASS
PRELIMINARY RESULTS OF A NOVEL BIOLOGICAL PROCESS FOR TREATING DAIRY WASTES,
W71-03568 05D

BITUMINOUS MATERIALS
THE APPLICATION OF BITUMEN FOR EARTH AND ROCKFILL DAMS,
W71-03350 08D

BLACKMAN-TUKEY METHOD
COMPARING POWER SPECTRA COMPUTED BY BLACKMAN-TUKEY AND FAST FOURIER TRANSFORM,
W71-03676 02E

BLOCK DEVELOPMENT SURVEYS
GEOMORPHOLOGY AT THE CENTRAL ARID ZONE RESEARCH INSTITUTE, INDIA,
W71-03339 07A

BLOOD CHANGE
CHANGES IN THE BLOOD OF BROOK TROUT (SALVELINUS FONTINALIS) AFTER SHORT-TERM AND LONG-TERM EXPOSURE TO COPPER,
W71-03450 05C

BOREHOLE DEFORMATION GAGE
DEVELOPMENT OF A STRESS RELIEF METHOD WITH A THREE-DIRECTIONAL BOREHOLE DEFORMATOPM GAGE,
W71-03757 08F

BOTTOM SEDIMENTS
DIFFUSION AND ACCUMULATION OF CHLORIDE AND SODIUM IN LAKE ONTARIO, SEDIMENT,
W71-03672 02H

PHOSPHORUS CONTENT IN UNCONSOLIDATED SEDIMENTS FROM SOUTHE LAKE MICHIGAN,
W71-03703 05A

BOUNDARIES(PROPERTY)
SIMPSON V MARTIN (TITLE DISPUTE TO RIPARIAN LAND DEPENDS O WHETHER RIVER CHANGED COURSE BY ACCRETION OR AVULSION).
W71-03338 06E

POINT PRAIRIE HUNTING AND FISHING CLUB V SCHMIDT (TITLE DISPUTE TO DRY RIVER BED BETWEEN ISLAND AND MAINLAND).
W71-03358 06E

BAXTER V DAVIS (SALE OF RIPARIAN LAND).
W71-03363 06E

UNITED STATES V STEWART (LAND DESCRIBED AS BOUND BY THE WATER'S EDGE IS THAT LAND ABOVE THE MEAN HIGH WATER MARK).
W71-03524 06E

BOUNDARY DISPUTES
BURKE V COMMONWEALTH (TITLE TO ACCRETIONS WHERE DEED CONVE 'TO THE OCEAN').
W71-03396 06E

UNITED STATES V STEWART (LAND DESCRIBED AS BOUND BY THE WATER'S EDGE IS THAT LAND ABOVE THE MEAN HIGH WATER MARK).
W71-03524 06E

WISCONSIN V MICHIGAN (NAVIGABLE WATER AS BOUNDARY BETWEEN STATES).
W71-03626 06E

BOUNDARY EFFECTS
BOUNDARY EFFECTS OF GRADED ROUGHNESS ELEMENTS IN TWO-DIMENSIONAL FLOW IN OPEN CHANNELS,
W71-03323 08B

BOUNDARY WATERS
BOUNDARY WATERS PROBLEMS OF CANADA AND THE UNITED STATES (RESOLUTION OF BOUNDARY DISPUTES BY THE INTERNATIONAL JOIN COMMISSION),
W71-03781 06E

BOUNDARY WATERS TREATY
CANADA - UNITED STATES INTERNATIONAL WATER PROBLEMS,
W71-03596 06E

BOUNDRY DISPUTES
LANGEVIN V FLETCHER (BOUNDARY DISPUTE WHERE CONVEYANCE IS BANK OF BROOK IN RAVINE).
W71-03756 06E

BOWEN RATIO
DERIVED METEOROLOGICAL DATA TRANSPIRATION,
W71-03345 02D

BRAIDING
TOPOLOGICAL AND GEOMETRICAL PROPERTIES OF BRAIDED STREAMS,
W71-03683 02J

BREAKWATERS
BURKE V COMMONWEALTH (TITLE TO ACCRETIONS WHERE DEED CONVE 'TO THE OCEAN').
W71-03396 06E

BREEDER REACTORS
ELECTRIC GENERATING PROSPECTS FOR NUCLEAR POWER,
W71-03759 08C

BRIDGE DESIGN
BRIDGE DESIGN CONSIDERING SCOUR AND RISK,
W71-03739 08A

BRIDGE PIERS
BRIDGE DESIGN CONSIDERING SCOUR AND RISK,
W71-03739 08A

BRIDGER(MONT)
BRIDGER INSTRUMENT MODIFICATION,
W71-03376 07A

BRIDGER HYDROMETEOROLOGICAL RESEARCH AREA AND FACILITIES,
W71-03377 07A

BRIDGER TELEMETRY COMMUNICATIONS SYSTEMS,
W71-03378 07A

BRIDGER HYDROMETEOROLOGICAL DATA ACQUISITION SYSTEM,
W71-03379 07A

BRIDGES
BRIDGE DESIGN CONSIDERING SCOUR AND RISK,
W71-03739 08A

BRINE DISPOSAL
POND LININGS FOR DESALTING PLANT EFFLUENTS.
W71-03523 05G

BROOK TROUT

CHANGES IN THE BLOOD OF BROOK TROUT (SALVELINUS FONTINALIS) AFTER SHORT-TERM AND LONG-TERM EXPOSURE TO COPPER,
W71-03450 05C

BROWARD COUNTY
REPORT ON WATER AND WASTE WATER FOR BROWARD COUNTY, FLORIDA.
W71-03532 05D

BUDGETARY CONSTRAINT
POLITICAL AND BUDGETARY CONSTRAINTS SOME CHARACTERISTICS AND IMPLICATIONS,
W71-03620 06C

BUDGETING
THE STATUS OF PPB IN FEDERAL AGENCIES A COMPARATIVE PERSPECTIVE,
W71-03657 06B

RESCUING POLICY ANALYSIS FROM PPBS,
W71-03658 06B

DEVELOPMENT OF P P B SYSTEM IN THE STATE OF MICHIGAN,
W71-03661 06B

THE NEW YORK STATE PLANNING, PROGRAMMING AND BUDGETING SYSTEM,
W71-03663 06B

BUDGETS
ECONOMIC FACTORS AFFECTING SYSTEM DESIGN,
W71-03606 06B

ZERO-BASE BUDGETING,
W71-03644 06C

CALIFORNIA'S PROGRAMING AND BUDGETING SYSTEM,
W71-03660 06B

BUTTERFLY VALVES
BUTTERFLY VALVES,
W71-03821 05D

BYELORUSSIA(USSR)
COMPRESSION OF THE PEAT-BOGS AFTER DRAINING,
W71-03427 02F

CABLE TOOL DRILLING
DEVELOPMENT OF WELLS WITH CABLE TOOLS,
W71-03845 08A

CALCAREOUS SOILS
THE CHELATION AND MOVEMENT OF SR89-SR90 (Y90) IN A CALCAREOUS SOIL,
W71-03495 02G

CALCIUM
SIGNIFICANCE OF SILICA IN THE LOSS OF MAGNESIUM FROM IRRIGATION WATERS,
W71-03494 02K

CALCIUM ACTIVITY, COMPLEX AND ION-PAIR IN SATURATED CACO SUB 3 SOLUTIONS,
W71-03502 02K

CALCIUM ACTIVITY
CALCIUM ACTIVITY, COMPLEX AND ION-PAIR IN SATURATED CACO SUB 3 SOLUTIONS,
W71-03502 02K

CALCIUM CARBONATE
CALCIUM ACTIVITY, COMPLEX AND ION-PAIR IN SATURATED CACO SUB 3 SOLUTIONS,
W71-03502 02K

CALCIUM COMPOUNDS
CALCIUM ACTIVITY, COMPLEX AND ION-PAIR IN SATURATED CACO SUB 3 SOLUTIONS,
W71-03502 02K

CALIFORNIA
CESIUM UPTAKE BY SUDANGRASS SEEDLINGS FROM FOUR SOILS IN SOUTHERN CALIFORNIA,
W71-03496 02I

UNITED STATES V STEWART (LAND DESCRIBED AS BOUND BY THE WATER'S EDGE IS THAT LAND ABOVE THE MEAN HIGH WATER MARK).

STREAMFLOW RECORDS OF THE SNOWY MOUNTAINS REGION, AUSTRA TO 1965 - VOLUME 1 GENERAL INFORMATION AND MURRUMBIDGE RIVER BASIN.
W71-03708 07C

STREAMFLOW RECORDS OF THE SNOWY MOUNTAINS REGION, AUSTRA TO 1965 - VOLUME 2 UPPER MURRAY RIVER BASIN.
W71-03709 07C

STREAMFLOW RECORDS OF THE SNOWY MOUNTAINS REGION, AUSTRA TO 1965 - VOLUME 3 SNOWY RIVER BASIN.
W71-03710 07C

FLOW NETS
ORTHONORMAL FUNCTION TABLES AND THE SEEPAGE OF STEADY RA THROUGH SOIL BEDDING,

W71-03441 02G

LOW PROFILES
EFFECT OF CHANNEL SHAPE ON GRADUALLY VARIED FLOW PROFILES,
W71-03669 08B

LOW RESISTANCE
ESTIMATE OF TURBULENCE AND HYDRAULIC RESISTANCES DURING WAVE MOTION IN BODIES OF WATER,
W71-03713 02E

LUID FRICTION
ESTIMATE OF TURBULENCE AND HYDRAULIC RESISTANCES DURING WAVE MOTION IN BODIES OF WATER,
W71-03713 02E

LUID MECHANICS
ENERGY DISSIPATION USING AIR INJECTION,
W71-03737 08B

LUVIAL HYDRAULICS
GEOMETRIC STABILITY ANALYSIS OF AN ALLUVIAL RIVER,
W71-03383 08B

OAMING
CONTAMINANT REMOVAL FROM SEWAGE PLANT EFFLUENTS BY FOAMING,
W71-03511 05D

AEROBIC DIGESTION OF SWINE WASTE,
W71-03570 05D

OOD CHAINS
SOME EFFECTS OF HEATED EFFLUENTS ON MARINE PHYTOPLANKTON,
W71-03469 05C

ORECASTING
WEATHER AND PLANT DISEASE FORECASTING,
W71-03348 03F

CALIFORNIA'S PROGRAMING AND BUDGETING SYSTEM,
W71-03660 06B

OREIGN RESEARCH
REPORT OF NATIONALLY DESIGNATED EXPERTS ON EUTROPHICATION CONTROL.
W71-03443 05C

PRIORITY PROBLEMS IN WATER MANAGEMENT RESEARCH IN SOUTHERN EUROPEAN COUNTRIES.
W71-03446 06A

OREIGN WATERS
THE LAW OF INTERNATIONAL WATERWAYS,
W71-03803 06E

OSSIL FUEL
NUCLEAR POWER STAGES COMEBACK,
W71-03463 05G

OULING
MOLLUSCS FROM A POWER STATION CULVERT,
W71-03468 05C

OUNDATION INVESTIGATIONS
PRELIMINARY FINITE ELEMENT ANALYSIS, ATCHAFALAYA BASIN PROTECTION LEVEES TEST SECTION 3,
W71-03328 08D

OUNDATIONS
PRECOMPRESSION FOR IMPROVING FOUNDATION SOILS,
W71-03355 08D

ANALYSIS OF PILE GROUP BEHAVIOR,
W71-03740 08D

THE SAFETY FACTOR IN EXCAVATIONS AND FOUNDATIONS,
W71-03741 08D

FOUNDATION INSTRUMENTATION AT PLEASANT VALLEY PUMPING PLANT,
W71-03767 08D

OURIER ANALYSIS
COMPARING POWER SPECTRA COMPUTED BY BLACKMAN-TUKEY AND FAST FOURIER TRANSFORM,
W71-03676 02E

RACTIONATION
FRACTIONATION OF PHOSPHATE IN A MATURITY SEQUENCE OF NEW ZEALAND BASALTIC SOIL PROFILES I,
W71-03482 02G

FRACTIONATION OF PHOSPHATE IN A MATURITY SEQUENCE OF NEW ZEALAND BASALTIC SOIL PROFILES 2,
W71-03483 02G

REE ENERGY
A CRITICAL EVALUATION OF TISSUE-IMMERSION METHODS FOR MEASUREMENT OF PLANT WATER POTENTIAL,
W71-03331 02I

REEZING
PART 1. A DESIGN STUDY OF FREEZING AND GAS HYDRATE FORMATION. PART 2. FEASIBILITY TESTS OF FREEZING,
W71-03512 05D

REQUENCY ANALYSIS
SPECTRAL MEASUREMENTS AND GROWTH RATES OF WIND-GENERATED WATER WAVES,
W71-03726 02E

REUNDLICH EQUATION
REMOVAL OF PHOSPHATES BY SORPTION ON ACTIVATED ALUMINA,
W71-03518 05D

FRICTION FACTOR
INTERNAL HYDRAULICS OF THERMAL DISCHARGE DIFFUSERS, A DISCUSSION,
W71-03461 05D

GAGING STATIONS
INSTRUMENTATION AND DEVELOPMENT OF TECHNIQUES TO MEASURE AND EVALUATE METEOROLOGICAL PARAMETERS IMPORTANT TO HYDROLOGY,
W71-03375 07A

STREAMFLOW RECORDS OF THE SNOWY MOUNTAINS REGION, AUSTRALIA TO 1965 - VOLUME 1 GENERAL INFORMATION AND MURRUMBIDGEE RIVER BASIN.
W71-03708 07C

STREAMFLOW RECORDS OF THE SNOWY MOUNTAINS REGION, AUSTRALIA TO 1965 - VOLUME 2 UPPER MURRAY RIVER BASIN.
W71-03709 07C

STREAMFLOW RECORDS OF THE SNOWY MOUNTAINS REGION, AUSTRALIA TO 1965 - VOLUME 3 SNOWY RIVER BASIN.
W71-03710 07C

GAS HYDRATION
PART 1. A DESIGN STUDY OF FREEZING AND GAS HYDRATE FORMATION. PART 2. FEASIBILITY TESTS OF FREEZING,
W71-03512 05D

GASES
DANGEROUS GASES IN AGRICULTURE.

SUMMARY OF EVALUATION PROCESSES IN WATER RESOURCES PLANNING,
W71-03777 06B

PLANNING-PROGRAMMING-BUDGETING
THE PLANNING PROGRAMMING-BUDGETING APPROACH TO GOVERNMENT
DECISION-MAKING,
W71-03648 06B

PLANT ASSOCIATIONS
VEGETATION OF THE ERER-GOTA PLAIN, ETHIOPIA,
W71-03336 02I

PLANT DISEASES
WEATHER AND PLANT DISEASE FORECASTING,
W71-03348 03F

PLANT FOOD CONTENT
THE EFFECT OF APPLICATION RATE OF CHICKEN MANURE ON THE
YIELD OF CORN,
W71-03558 05D

PLANT PATHOLOGY
WEATHER AND PLANT DISEASE FORECASTING,
W71-03348 03F

PLANT PHYSIOLOGY
A CRITICAL EVALUATION OF TISSUE-IMMERSION METHODS FOR
MEASUREMENT OF PLANT WATER POTENTIAL,
W71-03331 02I

PLANT POPULATIONS
THE EFFECT OF ROW SPACING AND PLANT POPULATION ON IRRIGATED
CORN PRODUCTION,
W71-03489 03F

PLANT TISSUES
A CRITICAL EVALUATION OF TISSUE-IMMERSION METHODS FOR
MEASUREMENT OF PLANT WATER POTENTIAL,
W71-03331 02I

PLANTING MANAGEMENT
INTERROW WATERSHEDS,
W71-03486 03F

PLANT-WATER RELATIONSHIPS
A CRITICAL EVALUATION OF TISSUE-IMMERSION METHODS FOR
MEASUREMENT OF PLANT WATER POTENTIAL,
W71-03331 02I

PLASTICITY
WATER PERMEABILITY AND PLASTIC INDEX OF SOILS,
W71-03424 02F

RELATIONSHIP OF CONSOLIDATION CHARACTERISTICS AND ATTERBERG
LIMITS FOR SUBSIDING SEDIMENTS IN CENTRAL CALIFORNIA,
U.S.A.,
W71-03425 02F

POLAR LANDS
WORLD RESOURCES AND TECHNOLOGY,
W71-03640 06E

POLITICAL CONSTRAINT
POLITICAL AND BUDGETARY CONSTRAINTS SOME CHARACTERISTICS
AND IMPLICATIONS,
W71-03620 06C

POLITICAL CONSTRAINTS
COMPLEX SYSTEMS ANALYSIS OF WATER QUALITY DYNAMICS THE
FEEDBACK SYSTEMS STRUCTURE,
W71-03731 06A

POLLUTANT IDENTIFICATION
DEVICE FOR FIELD DETERMINATION OF HEAVY METALS IN NATURAL
WATERS,
W71-03311 05A

A CONTROLLED DEPTH, VOLUMETRIC BOTTOM SAMPLER,
W71-03449 05A

DIGITAL SYSTEMS FOR ON-SITE DATA COLLECTIONS FOR WATER
QUALITY ANALYSIS,
W71-03782 05A

RESTORING THE QUALITY OF OUR ENVIRONMENT.
W71-03807 06E

POLLUTANT TRANSPORT
NUMERICAL SOLUTION TO THE CONVECTIVE DIFFUSION EQUATION,
W71-03690 05B

POLLUTANTS
AGRICULTURE POSES WASTE PROBLEMS.
W71-03537 05B

SOIL POLLUTANTS THEIR ORIGIN AND BEHAVIOR,
W71-03580 05B

ENVIRONMENTAL REPERCUSSIONS AND THE ECONOMIC STRUCTURE AN
INPUT-OUTPUT APPROACH,
W71-03622 06A

POLLUTION
PROCEEDINGS OF THE FOURTH AMERICAN WATER RESOURCES
CONFERENCE.
W71-03625 06B

MALTHUSIANISM AND CONSERVATION THEIR ROLE AS ORIGINS OF
THE DOCTRINE OF INCREASING ECONOMIC SCARCITY OF NATURAL
RESOURCES,
W71-03637 06B

DESIGN OF AN OVERVIEW SYSTEM FOR EVALUATING THE PUBLIC-HEALTH HAZARDS OF CHEMICALS IN THE ENVIRONMENT VOLUME I TEST CASE STUDIES,
W71-03770 05A

DESIGN OF AN OVERVIEW SYSTEM FOR EVALUATING THE PUBLIC-HEALTH HAZARDS OF CHEMICALS IN THE ENVIRONMENT. VOLUME II. THE OVERVIEW SYSTEM,
W71-03771 05A

POLLUTION ABATEMENT
NEW MINE SEALING TECHNIQUES FOR WATER POLLUTION ABATEMENT.
W71-03456 05G

RAISING LIVESTOCK IN THE URBAN FRINGE,
W71-03539 05G

PROBLEMS OF POLLUTION CONTROL,
W71-03819 05D

POLLUTION ABATEMENT SCHEDULES
ANNUAL REPORT 1970 DELAWARE RIVER BASIN COMMISSION.
W71-03592 06B

POLLUTION CONTROL
ECONOMICS OF WATER QUALITY,
W71-03612 05G

POLLUTION COSTS
POLLUTION, PROPERTY AND PRICES,
W71-03630 06C

POLYMER CONCRETES
CONCRETE-POLYMER MATERIALS DEVELOPMENT,
W71-03734 08F

POLYMERIZATION
CONCRETE-POLYMER MATERIALS DEVELOPMENT,
W71-03734 08F

POLYMERS
CONCRETE-POLYMER MATERIALS DEVELOPMENT,
W71-03734 08F

PONDS
POND LININGS FOR DESALTING PLANT EFFLUENTS.
W71-03523 05G

POPULATION
POPULATION AND NATURAL RESOURCES,
W71-03638 06D

POTENTIAL EVAPORATION
THE USE OF PANS AND A THEORETICAL MODEL TO DEFINE THE ROLE OF EVAPORATION IN THE WATER BUDGETS OF THE CITY OF LARAMIE AND THE STATE OF WYOMING,
W71-03729 02D

POTENTIAL EVAPOTRANSPIRATION
DERIVED METEOROLOGICAL DATA TRANSPIRATION,
W71-03345 02D

THE USE OF SOIL WATER BALANCE RELATIONSHIPS IN AGROCLIMATOLOGY,
W71-03346 02D

EVAPORATION STUDIES IN STANDARD CATCHMENTS,
W71-03698 02D

POTOMAC RIVER
SMALL SAMPLE PROPERTIES OF H AND K--ESTIMATORS OF THE HURST COEFFICIENT H,
W71-03674 02E

POULTRY
HOUSE FLY PUPAE AS FOOD FOR POULTRY,
W71-03533 05D

FATTY ACID CONTENT AS A MEASURE OF THE ODOUR POTENTIAL OF STORED LIQUID POULTRY MANURE,
W71-03535 05A

POLLUTION FACTORS ASSOCIATED WITH EXCESSIVE POULTRY LITTER (MANURE) APPLICATION IN ARKANSAS,
W71-03544 05C

POULTRY POLLUTION PROBLEMS AND SOLUTIONS.
W71-03555 05D

INTRODUCTION,
W71-03556 05A

POULTRY MANURE HANDLING BY INDOOR SEPTIC TANKS (SO-CALLED 'INDOOR LAGOONS'),
W71-03557 05D

THE EFFECT OF APPLICATION RATE OF CHICKEN MANURE ON THE YIELD OF CORN,
W71-03558 05D

DRYING ANIMAL WASTE,
W71-03559 05D

THE UTILIZATION OF POULTRY WASTE AS A FEEDSTUFF FOR GROWING CHICKS,
W71-03560 05D

THE RESULT OF FEEDING DRIED POULTRY WASTE TO LAYING HENS ON EGG PRODUCTION AND FEED CONVERSION,
W71-03561 05D

THE EFFECT OF FEEDING DEHYDRATED POULTRY WASTE ON PRODUCTION, FEED EFFICIENCY, BODY WEIGHT, EGG WEIGHT, S THICKNESS AND HAUGH SCORE,
W71-03562 05D

THE EFFECT OF FEEDING DEHYDRATED POULTRY WASTE TO LAYIN HENS ON THE TASTE OF THE RESULTING EGGS,
W71-03563 05D

ACCEPTABILITY AND DIGESTIBILITY OF POULTRY AND DAIRY-WA BY SHEEP,
W71-03564 05D

DISTRIBUTION OF ARSENIC FROM POULTRY LITTER IN BROILER CHICKENS, SOIL, AND CROPS,
W71-03565 05A

POULTRY MANURE DISPOSAL - IS THERE A PROBLEM,
W71-03579 05D

THE EFFECTS OF VOLUME AND SURFACE AREA ON THE RATE OF ACCUMULATION OF SOLIDS IN INDOOR MANURE DIGESTION TANKS
W71-03582 05D

A NOTE ON THE UTILISATION BY CHICKENS OF ENERGY FROM FA
W71-03583 05D

POULTRY LITTER
POLLUTION FACTORS ASSOCIATED WITH EXCESSIVE POULTRY LIT (MANURE) APPLICATION IN ARKANSAS,
W71-03544 05C

DISTRIBUTION OF ARSENIC FROM POULTRY LITTER IN BROILER CHICKENS, SOIL, AND CROPS,
W71-03565 05A

POWER PLANTS
WATER QUALITY AND POWER PLANTS,
W71-03475 05C

MARINE BIOLOGY AND ELECTRICITY PLANNING,
W71-03477 05C

POWER SPECTRUM ANALYSIS
COMPARING POWER SPECTRA COMPUTED BY BLACKMAN-TUKEY AND FOURIER TRANSFORM,
W71-03676 02E

PPB SYSTEM
RESCUING POLICY ANALYSIS FROM PPBS,
W71-03658 06B

PRECIPITATION GAGES
REMOTE RECORDING PRECIPITATION GAGE,
W71-03711 07B

PRECIPITATION(ATMOSPHERIC)
METEOROLOGICAL DATA AND THE AGRICULTURAL PROBLEM,
W71-03343 02B

SOLID PRECIPITATION IN SUPER-COOLED CLOUD PART 1 - FREEZING OF A SUPERCOOLED WATER DROP DUE TO THE COLLISIO ICE CRYSTALS,
W71-03432 02B

SOLID PRECIPITATION IN SUPERCOOLED CLOUD PART 2 - GRO OF A SOLID PRECIPITATION PARTICLE,
W71-03433 02B

THE EFFECTS OF THE TIME LAG IN THE ACTIVATION OF ATMOSP ICE NUCLEI ON THE NUMBER OF ICE CRYSTALS IN CLOUD,
W71-03434 02B

AD HOC MEETING ON ACIDITY AND CONCENTRATION OF SULPHATE RAIN.
W71-03444 02B

PERSISTENCE OF PRECIPITATION AT 108 CITIES IN THE CONTERMINOUS UNITED STATES,
W71-03673 02B

ESTIMATION OF BASIN PRECIPITATION BY REGRESSION EQUATION
W71-03691 02B

PRECONSOLIDATION
PRECOMPRESSION FOR IMPROVING FOUNDATION SOILS,
W71-03355 08D

FOUNDATION PRECOMPRESSION WITH VERTICLE SAND DRAINS,
W71-03356 08D

PRELOADING
PRECOMPRESSION FOR IMPROVING FOUNDATION SOILS,
W71-03355 08D

FOUNDATION PRECOMPRESSION WITH VERTICLE SAND DRAINS,
W71-03356 08D

PRESTRESSED CONCRETE
PRESTRESSED CONCRETE LINING OF A ROCKFILL DAM,
W71-03744 08F

PRICES
POLLUTION, PROPERTY AND PRICES,
W71-03630 06C

PRIMARY TREATMENT
OPERATION AND MAINTENANCE OF A PRIMARY CLARIFIER,
W71-03820 05D

W71-03828 05D

IORITIES
PRIORITY PROBLEMS IN WATER MANAGEMENT RESEARCH IN SOUTHERN EUROPEAN COUNTRIES.
W71-03446 06A

OBLEM SOLVING
INTERNATIONAL ARID LANDS CONFERENCE,
W71-03340 06B

OCESSING
MISSION IMPOSSIBLE DISPOSE ANIMAL WASTES,
W71-03569 05D

ODUCTION
THE EFFECT OF FEEDING DEHYDRATED POULTRY WASTE ON PRODUCTION, FEED EFFICIENCY, BODY WEIGHT, EGG WEIGHT, SHELL THICKNESS AND HAUGH SCORE,
W71-03562 05D

OGRAMING
THE STATUS OF PPB IN FEDERAL AGENCIES A COMPARATIVE PERSPECTIVE,
W71-03657 06B

CALIFORNIA'S PROGRAMING AND BUDGETING SYSTEM,
W71-03660 06B

DEVELOPMENT OF P P B SYSTEM IN THE STATE OF MICHIGAN,
W71-03661 06B

P P B S IN CITY, STATE AND COUNTY AN OVERVIEW,
W71-03662 06B

OJECT ANALYSIS
WELFARE, ECONOMICS AND RESOURCE DEVELOPMENT,
W71-03641 06B

OJECT APPRAISAL
TECHNIQUES OF PROJECT APPRAISAL,
W71-03646 06B

OJECT PLANNING
PRE-IMPOUNDMENT RECREATIONAL USE PATTERN AND WATERFOWL OCCURRENCE IN THE SAYLORVILLE RESERVOIR AREA,
W71-03373 06B

OJECT PURPOSES
WATER MANAGEMENT RESEARCH GROUP FIRST REPORT (1969).
W71-03445 06A

OPERTY RIGHTS
POLLUTION, PROPERTY AND PRICES,
W71-03630 06C

OTOZOA
THE ISOLATION OF PROTOZOA AND ALGAE FROM THEIR BACTERIAL CONTAMINANTS,
W71-03775 05F

OVENANCE
SOURCES OF DISSOLVED CARBONATE IN AN AQUIFER FREE OF CARBONATE MINERALS,
W71-03694 02K

UBLIC BORROWING
ON THE OPPORTUNITY COST OF BORROWING,
W71-03651 06C

UBLIC ENTERPRISE
THE SECOND-BEST CASE FOR MARGINAL COST PRICING,
W71-03618 06C

UBLIC EXPENDITURE
PURE THEORY OF PUBLIC EXPENDITURE AND TAXATION,
W71-03621 06C

NATIONAL ECONOMIC PLANNING,
W71-03653 06B

UBLIC GOOD
WATER RESOURCE ALLOCATION, EXTRA MARKET VALUES, AND MARKET CRITERIA A SUGGESTED APPROACH,
W71-03603 06B

PURE THEORY OF PUBLIC EXPENDITURE AND TAXATION,
W71-03621 06C

NATIONAL ECONOMIC PLANNING,
W71-03653 06B

UBLIC GOODS
PUBLIC ECONOMICS,
W71-03616 06B

GENERAL EQUILIBRIUM WITH PUBLIC GOODS,
W71-03619 06B

CONTRAST BETWEEN WELFARE CONDITIONS FOR JOINT SUPPLY AND FOR PUBLIC GOODS,
W71-03652 06B

UBLIC HEALTH
DESIGN OF AN OVERVIEW SYSTEM FOR EVALUATING THE PUBLIC-HEALTH HAZARDS OF CHEMICALS IN THE ENVIRONMENT VOLUME I TEST CASE STUDIES,
W71-03770 05A

DESIGN OF AN OVERVIEW SYSTEM FOR EVALUATING THE PUBLIC-HEALTH HAZARDS OF CHEMICALS IN THE ENVIRONMENT. VOLUME II. THE OVERVIEW SYSTEM,
W71-03771 05A

WATER AND WASTE WATER SYSTEMS TO COMBAT CHOLERA IN EAST PAKISTAN,
W71-03814 05D

PUBLIC INVESTMENT
ECONOMIC ANALYSIS OF PUBLIC INVESTMENT DECISIONS INTEREST RATE POLICY AND DISCOUNTING ANALYSIS.
W71-03649 06B

PUBLIC RIGHTS
SILVER SPRINGS PARADISE CO V RAY (LAND PATENT AS NOT DEPRIVING PUBLIC OF RIGHT TO USE NAVIGABLE WATERS).
W71-03370 06E

MAINE LAW AFFECTING MARINE RESOURCES, VOLUME II STATE, PUBLIC, AND PRIVATE RIGHTS, PRIVILEGES, AND POWERS.
W71-03784 06E

STANDING TO SUE IN CONSERVATION SUITS,
W71-03795 06E

THE RIGHT TO A DECENT ENVIRONMENT PROGRESS ALONG A CONSTITUTIONAL AVENUE,
W71-03796 06E

LAW IN ACTION THE TRUST DOCTRINE,
W71-03797 06E

PUBLIC UTILITIES
TRUSTEES OF NEWPORT CENTER V NILES (WATER COMPANY'S DUTY TO MAINTAIN WORKS AND ADEQUATE SUPPLY).
W71-03480 06E

VILLAGE OF MILL NECK V TOWN OF OYSTER BAY (ALLOCATION OF WATER DISTRICT PROPERTY AMONG NEWLY INCORPORATED TOWNS).
W71-03540 06E

PUBLICATIONS
NATURAL RESOURCES IN THE GOVERNMENTAL PROCESS A BIBLIOGRAPHY SELECTED AND ANNOTATED,
W71-03804 06E

PUMPS
PERFORMANCE OF ALLOYS AGAINST EROSION - CORROSION ATTACK,
W71-03838 08G

PYRRONES
EVALUATION OF PYRRONES AS MEMBRANES,
W71-03780 05D

RADIATION BALANCE
SOLAR RADIATION AND THE USE OF IT BY PLANTS,
W71-03344 02I

RADIOACTIVE WASTES
THE CHELATION AND MOVEMENT OF SR89-SR90 (Y90) IN A CALCAREOUS SOIL,
W71-03495 02G

RAILROADS
LOUISVILLE AND N RR V VANDIVER (DIVERSION OF RIVER CAUSED BY OBSTRUCTION).
W71-03353 06E

RAIN
AD HOC MEETING ON ACIDITY AND CONCENTRATION OF SULPHATE IN RAIN.
W71-03444 02B

RAIN GAGES
THE EFFECT OF WIND ON THE PRECIPITATION DISTRIBUTION OVER A HILLOCK,
W71-03395 02B

RAINDROPS
THE EFFECT OF RAINDROP IMPACT AND SURFACE ROUGHNESS ON SHEET FLOW,
W71-03310 02B

RAINFALL
WILDLIFE V SHEEP AND CATTLE IN AFRICA,
W71-03341 03F

RAINFALL DISPOSITION
THE EFFECT OF WIND ON THE PRECIPITATION DISTRIBUTION OVER A HILLOCK,
W71-03395 02B

RAINFALL INTENSITY
FLOOD SERIES COMPARED TO RAINFALL EXTREMES,
W71-03685 02E

RAINFALL-RUNOFF MODELS
DEFINITION AND USES OF THE LINEAR REGRESSION MODEL,
W71-03682 02A

RAINFALL-RUNOFF RELATIONSHIPS
COMPILATION OF HYDROLOGIC DATA, DEEP CREEK, COLORADO RIVER BASIN, TEXAS, 1968.
W71-03398 07C

COMPILATION OF HYDROLOGIC DATA, HONEY CREEK, TRINITY RIVER BASIN, TEXAS, 1968.
W71-03399 07C

COMPILATION OF HYDROLOGIC DATA, GREEN CREEK, BRAZOS RIVER BASIN, TEXAS, 1968.
W71-03400 07C

DEFINITION AND USES OF THE LINEAR REGRESSION MODEL,
W71-03682 02A

FLOOD SERIES COMPARED TO RAINFALL EXTREMES,
W71-03685 02E

POSSIBLE EFFECTS OF PRECIPITATION MODIFICATION ON STREAM CHANNEL GEOMETRY AND SEDIMENT YIELD,
W71-03693 03B

COMPILATION OF HYDROLOGIC DATA, CALAVERAS CREEK, SAN ANTONIO RIVER BASIN, TEXAS, 1968.
W71-03704 07C

THE GENETIC METHOD OF COMPUTATION OF FLOOD CAUSED BY STORM RAINFALLS IN SMALL CATCHMENT AREAS IN THE ABSENCE OF HYDROLOGICAL DATA,
W71-03716 02A

METHOD OF COMPUTING RAINFALL FLOODS CHARACTERISTICS,
W71-03717 02A

CONTRIBUTION TO THE METHODOLOGY OF EVALUATION OF MAXIMUM FLOOD FLOW WHEN AVAILABLE DATA ARE INSUFFICIENT (FRENCH),
W71-03718 02A

EXPERIMENTAL STUDY OF RAINFALL RUNOFF,
W71-03719 02A

RAINFALL FLOOD FORMATION THEORY AND METHODS OF RAINFALL FLOOD COMPUTATION,
W71-03720 02A

FLOOD HYDROLOGY OF SMALL WATERSHEDS--EVALUATION OF TIME PARAMETERS AND DETERMINATION OF PEAK DISCHARGE,
W71-03724 02E

THE EFFECT OF RAINFALL ON THE MECHANICS OF STEADY SPATIALLY VARIED SHEET FLOW ON A HYDRAULICALLY SMOOTH BOUNDARY,
W71-03727 02E

RANDOM WALK METHOD
VEGETATION AND WATERSHED SHAPE,
W71-03692 02J

RATE OF RETURN
INPUT CHOICES AND RATE OF RETURN REGULATION AN OVERVIEW OF THE DISCUSSION,
W71-03609 06C

RATE OF RETURN ON INVESTMENT RISK,
W71-03645 06C

INTEREST RATE POLICY FOR THE EVALUATION OF FEDERAL PROGRAMS,
W71-03650 06B

RATES OF APPLICATION
THE EFFECT OF APPLICATION RATE OF CHICKEN MANURE ON THE YIELD OF CORN,
W71-03558 05D

RATIONAL CHOICE
RATIONAL CHOICE IN WATER RESOURCES PLANNING,
W71-03642 06B

RAW SLUDGE
RAW SLUDGE PUMPING PROBLEMS AND INTERDISCIPLINARY SOLUTIONS,
W71-03813 05D

REAL PROPERTY
WABASH AND ERIE CANAL LANDS (DUTY OF STATE AUDITOR TO EXECUTE PATENTS TO ORIGINAL PURCHASERS OR GRANTEES).
W71-03365 06E

RECHARGE
ONE-DIMENSIONAL GROUNDWATER RECHARGE,
W71-03405 02F

RECIRCULATED WATER
REUSE OF WASH WATER FOR CLEANING CAGED LAYER HOUSES,
W71-03573 05D

RECREATION
PRE-IMPOUNDMENT RECREATIONAL USE PATTERN AND WATERFOWL OCCURRENCE IN THE SAYLORVILLE RESERVOIR AREA,
W71-03373 06B

USER RESPONSE IN OUTDOOR RECREATION A COMMENT,
W71-03664 06B

EVALUATION OF RECREATION AND AESTHETIC USES OF WATER IN AN URBAN SETTING,
W71-03765 06B

RECREATION FACILITIES
AUTHORITY TO THE SECRETARY OF AGRICULTURE TO MODIFY CERTAIN LEASES IN RE RECREATIONAL FACILITIES IN RESERVOIR AREAS.
W71-03788 06E

RECREATION USE SURVEYS
PRE-IMPOUNDMENT RECREATIONAL USE PATTERN AND WATERFOWL OCCURRENCE IN THE SAYLORVILLE RESERVOIR AREA,
W71-03373 06B

RECREATIONAL USES
EVALUATION OF RECREATION AND AESTHETIC USES OF WATER IN AN URBAN SETTING,
W71-03765 06B

REFILTRATION
COAGULATION TESTING A COMPARISON OF TECHNIQUES,
W71-03312 05D

COAGULATION TESTING A COMPARISON OF TECHNIQUES, PARTS I AND II,
W71-03313 05D

REFRACTIVITY
PAB PROCESS FOR ADVANCED WASTE TREATMENT,
W71-03519 05D

REGIONAL ANALYSIS
CHANGING AGRICULTURAL PRACTICE IN AN ARABIAN OASIS A CAS STUDY OF THE AL'AIN OASIS, ABU DHABI,
W71-03333 03F

NATURAL RESOURCE ENDOWMENT AND REGIONAL ECONOMIC GROWTH,
W71-03643 06B

A REGIONAL WATER RESOURCE MANAGEMENT PLAN FOR DANE COUNTY
W71-03760 06B

REGIONAL INTEGRATION
STRATEGIES OF AMERICAN WATER MANAGEMENT,
W71-03602 06B

REGIONAL PLANNING
REPORT ON WATER AND WASTE WATER FOR BROWARD COUNTY, FLORI
W71-03532 05D

REGIONAL SEWERAGE SYSTEM
ANNUAL REPORT 1970 DELAWARE RIVER BASIN COMMISSION.
W71-03592 06B

REGIONAL WATER QUALITY ADMINISTRATION
ANNUAL REPORT 1970 DELAWARE RIVER BASIN COMMISSION.
W71-03592 06B

REGIONS
DEVELOPING A REGIONAL WASTE WATER SYSTEM,
W71-03811 05D

REGRESSION ANALYSIS
THE STUDENT'S T TEST IN MULTIPLE REGRESSION UNDER SIMPLE COLLINEARITY,
W71-03607 06A

RELIABILITY OF A VARIANCE ESTIMATE OBTAINED FROM A SAMPLE AUGMENTED BY MULTIVARIATE REGRESSION,
W71-03675 07A

STATISTICAL DECISION THEORY TECHNIQUES FOR THE REVISION O MEAN FLOOD FLOW REGRESSION ESTIMATES,
W71-03681 02E

DEFINITION AND USES OF THE LINEAR REGRESSION MODEL,
W71-03682 02A

ESTIMATION OF BASIN PRECIPITATION BY REGRESSION EQUATION,
W71-03691 02B

REGULATION
INPUT CHOICES AND RATE OF RETURN REGULATION AN OVERVIEW THE DISCUSSION,
W71-03609 06C

MAINE LAW AFFECTING MARINE RESOURCES, VOLUME III REGULATION OF THE COAST LAND AND WATER USES.
W71-03785 06E

REINFORCED CONCRETE
CONCRETE BEAMS WITH PRESTRESSED REINFORCEMENT,
W71-03354 08F

CONFINEMENT SWINE HOUSING - SLOTTED FLOORS,
W71-03589 05D

RELEVANT ALTERNATIVES
RATIONAL CHOICE IN WATER RESOURCES PLANNING,
W71-03642 06B

REMEDIES
OUTLINE OF FEDERAL ENVIRONMENTAL LAW FOR THE PRACTICING LAWYER,
W71-03794 06E

REPUBLIC OF THE SUDAN
SOIL SALINITY IN THE WEST CENTRAL GEZIRA, REPUBLIC OF THE SUDAN,
W71-03499 02G

RESEARCH AND DEVELOPMENT
SUMMARY REPORT-THE ADVANCES WASTE TREATMENT RESEARCH PROGR JUNE 1960-DECEMBER 1961.
W71-03516 05D

RESEARCH FACILITIES
A WATER RESOURCES ECOLOGY CAPABILITY FOR THE WATERWAYS EXPERIMENT STATION AND CORPS OF ENGINEERS,
W71-03318 09C

RESERVATION DOCTRINE
LAW IN ACTION THE TRUST DOCTRINE,
W71-03797 06E

RESERVOIR CAPACITY
THE 1966 GUERNSEY RESERVOIR SEDIMENT SURVEY,
W71-03768 02J

RESERVOIR DESIGN
PRE-IMPOUNDMENT RECREATIONAL USE PATTERN AND WATERFOWL OCCURRENCE IN THE SAYLORVILLE RESERVOIR AREA,

W71-03373 06B

SOME EXTENSIONS OF TWO-STREAMS STORAGE MODEL,
W71-03699 04A

RESERVOIR EVALUATION
FUNCTIONAL EVALUATION OF A WATER RESOURCES SYSTEM,
W71-03598 06A

RESERVOIR EVAPORATION
EFFECTS OF A MONOLAYER ON RESERVOIR TEMPERATURE AND EVAPORATION,
W71-03473 03B

RESERVOIR MANAGEMENT
MANIPULATION OF RESERVOIR WATERS FOR IMPROVED QUALITY AND FISH POPULATION RESPONSE,
W71-03307 05G

RESERVOIR OPERATION
THE ROLE OF TVA RESERVOIRS IN REDUCING FLOOD CRESTS ON THE LOWER OHIO AND MISSISSIPPI RIVERS,
W71-03382 04A

FUNCTIONAL EVALUATION OF A WATER RESOURCES SYSTEM,
W71-03598 06A

RESERVOIR SILTING
THE 1966 GUERNSEY RESERVOIR SEDIMENT SURVEY,
W71-03768 02J

RESERVOIR SITES
PRELIMINARY RECONNAISSANCE OF AREAS TO BE IMPOUNDED IN THE SALT RIVER BASIN OF KENTUCKY,
W71-03315 02I

RESERVOIR STORAGE FORECASTING
SOME EXTENSIONS OF TWO-STREAMS STORAGE MODEL,
W71-03699 04A

RESERVOIR SURVEYS
THE 1966 GUERNSEY RESERVOIR SEDIMENT SURVEY,
W71-03768 02J

RESERVOIRS
AUTHORITY TO THE SECRETARY OF AGRICULTURE TO MODIFY CERTAIN LEASES IN RE RECREATIONAL FACILITIES IN RESERVOIR AREAS.
W71-03788 06E

RESIDENTIAL WATER CONSUMPTION
DETERMINATION OF THE SIGNIFICANCE OF VARIABLES AFFECTING RESIDENTIAL WATER CONSUMPTION,
W71-03517 06D

RESINS
BASIC SALTNOGEN ION-EXCHANGE RESINS FOR SELECTIVE NITRATE REMOVAL FROM POTABLE AND EFFLUENT WATERS,
W71-03455 05D

QUANTITATIVE STUDIES OF ROOTS IN SOIL. I. LENGTH AND DIAMETERS OF COTTON ROOTS IN A CLAY-LOAM SOIL BY ANALYSIS OF SURFACE-GROUND BLOCKS OF RESIN-IMPREGNATED SOIL,
W71-03501 02G

RESOURCE ALLOCATION
PUBLIC ECONOMICS,
W71-03616 06B

THE SECOND-BEST CASE FOR MARGINAL COST PRICING,
W71-03618 06C

ZERO-BASE BUDGETING,
W71-03644 06C

USER RESPONSE IN OUTDOOR RECREATION A COMMENT,
W71-03664 06B

RESOURCE DEVELOPMENT
A PROGRESS REPORT ON THE FUTURE OF CHICAGO'S LAKEFRONT.
W71-03761 06B

RESOURCE ENDOWMENT
NATURAL RESOURCE ENDOWMENT AND REGIONAL ECONOMIC GROWTH,
W71-03643 06B

RETAINING WALLS
DESIGN OF EARTH RETAINING STRUCTURES FOR DYNAMIC LOADS,
W71-03749 08D

REVERSE OSMOSIS
EVALUATION OF PYRRONES AS MEMBRANES,
W71-03780 05D

REVERSE-ROTARY DRILLING
DEVELOPMENT OF REVERSE-ROTARY WELLS,
W71-03844 08A

REVERSE ROTARY WELL CONSTRUCTION,
W71-03847 08A

REVERT
REVERT CUTS COSTS AND MAKES BETTER WELLS,
W71-03846 08A

REVIEWS
ONE-DIMENSIONAL GROUNDWATER RECHARGE,
W71-03405 02F

NATURAL RESOURCES IN THE GOVERNMENTAL PROCESS A BIBLIOGRAPHY SELECTED AND ANNOTATED,
W71-03804 06E

RHEOLOGY
WATER PERMEABILITY AND PLASTIC INDEX OF SOILS,
W71-03424 02F

RELATIONSHIP OF CONSOLIDATION CHARACTERISTICS AND ATTERBERG LIMITS FOR SUBSIDING SEDIMENTS IN CENTRAL CALIFORNIA, U.S.A.,
W71-03425 02F

VISCO-ELASTIC THEORY OF THE DEFORMATION OF A CONFINED AQUIFER,
W71-03426 02F

RIG SELECTION
CONSIDER LOST CIRCULATION IN WELL PLANNING, RIG SELECTION,
W71-03834 04B

RIGHT-OF-WAY
TENNECO, INC V GREATER LAFOURCHE PORT COMM'N (LIABILITY FOR COST OF PIPELINE CHANGES BECAUSE OF CHANNEL IMPROVEMENT).
W71-03705 06E

RIPARIAN LAND
SIMPSON V MARTIN (TITLE DISPUTE TO RIPARIAN LAND DEPENDS ON WHETHER RIVER CHANGED COURSE BY ACCRETION OR AVULSION).
W71-03338 06E

BAXTER V DAVIS (SALE OF RIPARIAN LAND).
W71-03363 06E

RIPARIAN RIGHTS
GUCKER V TOWN OF HUNTINGTON (DESTRUCTION OF RIPARIAN RIGHTS OF ACCESS BY RAISING LEVEL OF SAND BAR).
W71-03525 06E

MAINE LAW AFFECTING MARINE RESOURCES, VOLUME II STATE, PUBLIC, AND PRIVATE RIGHTS, PRIVILEGES, AND POWERS.
W71-03784 06E

A SURVEY OF NEW HAMPSHIRE WATER LAW,
W71-03805 06E

RISK
RISK TAKING AND RESOURCE ALLOCATION,
W71-03617 06B

RATE OF RETURN ON INVESTMENT RISK,
W71-03645 06C

RISK AVERSION
RISK TAKING AND RESOURCE ALLOCATION,
W71-03617 06B

RISKS
THE DISUTILITY OF UNCERTAIN LOSSES,
W71-03591 06B

RIVER FLOW
THE QUASI-PERMANENT REGIME OF RIVERS AND THE PREDICTION OF FLOODS,

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Water Resources Division of the U.S. Geological Survey, U.S. Department of the Interior.
- Metropolitan water resources management at the Center for Urban Studies of the University of Chicago.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Research Institute of Rutgers University.
- Design and construction of hydraulic structures; weather modification; and evaporation control at the Bureau of Reclamation, Denver, Colorado.
- Eutrophication at the Water Resources Center of the University of Wisconsin, jointly sponsored by the EPA, Soap and Detergent Association, and the Agricultural Research Service.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.

Supported by the Environmental Protection Agency in cooperation with WRSIC.

- Thermal pollution at the Department of Sanitary and Water Resources Engineering of Vanderbilt University.
- Textile wastes pollution at the School of Textiles of North Carolina State University.
- Water quality requirements for freshwater and marine organisms at the College of Fisheries of the University of Washington.
- Wastewater treatment and management at the Center for Research in Water Resources of the University of Texas.
- Agricultural livestock wastes at the Department of Agricultural Engineering of Iowa State University.

Subject Fields

- NATURE OF WATER
- WATER CYCLE
- WATER SUPPLY AUGMENTATION AND CONSERVATION
- WATER QUANTITY MANAGEMENT AND CONTROL
- WATER QUALITY MANAGEMENT AND PROTECTION
- WATER RESOURCES PLANNING
- RESOURCES DATA
- ENGINEERING WORKS
- MANPOWER, GRANTS, AND FACILITIES
- SCIENTIFIC AND TECHNICAL INFORMATION

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 4, NUMBER 8
APRIL 15, 1971

W71-03851 -- W71-04350

SELECTED WATER RESOURCES ABSTRACTS is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the National Technical Information Service (NTIS), U.S. Department of Commerce. NTIS was established September 2, 1970, as a new primary operating unit under the Assistant Secretary of Commerce for Science and Technology to improve public access to the many products and services of the Department. Information services for Federal scientific and technical report literature previously provided by the Clearinghouse for Federal Scientific and Technical Information will now be provided by NTIS.

SELECTED WATER RESOURCES ABSTRACTS is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U.S. Department of the Interior, Washington, D. C. 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from the National Technical Information Service. Annual subscription is $22 (domestic), $27.50 (foreign), single copy price $3. Certain documents abstracted in this journal can be purchased from the NTIS at prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

VOLUME 4, NUMBER 8
APRIL 15, 1971

W71-03851 -- W71-04350

funds for printing this publication approved by the Director of the Bureau of the Budget, September 4, 1968.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus** (November 1966 edition). Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on inside back cover.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

ntifiers: *Polywater, Isocaps.

illary phenomena that affect the behavior of ny liquids may explain the peculiar behavior of ywater, according to materials scientist and tistry professor William J. O'Brien of the higan University dental school. The dissolving ver of liquids is intensified billions of times when r vapors condense in microscopic capillaries. a result, the condensing vapors extract normally oluble ions from the capillary walls. This could ount for the high concentrations of impurities nd by some workers in their preparations of ywater. In developing equations to describe id behavior in isocaps, surface tension of water very thin isocap was found to be 700 dyne per about 10 times normal. This high surface ten- hinders nucleation and prevents vapors from densing by the usual method. Since the drive to dense is very strong, the dissolving power of densing vapor extracts ions from the capillary ls. High-purity quartz contains enough impuri- to account for the ions found in polywater con- sed from triple-distilled water. The slow process olves diffusion of ions through the glass to the rface. RUCTURE OF WATER IN MICROEMUL-NS: ELECTRICAL, BIREFRINGENCE, AND CLEAR MAGNETIC RESONANCE STUDIES,
rida Univ., Gainesville. Dept. of Chemical En- eering; and Florida Univ., Gainesville. Dept. of esthesiology.
esh O. Shah, and Roy M. Hamlin, Jr.
nce, Vol 171, No 3970, p 483-485, February 5, 1. 3 p, 2 fig, 14 ref. FWQA Grant WP 15080 P.

criptors: *Microenvironment, *Water struc-, *Oil-water interfaces, *X-ray analysis, Emul-s, Molecular structure, Electrical resistance, ical properties, Oily water, Chemical proper-, Potassium, Analytical techniques.
ntifiers: *Microemulsions, Water-oil disper-s, Emulsified water.

roemulsions, which are optically transparent water dispersions, were produced by mixing adecane, hexanol, potassium oleate, and water. the amount of water is increased, the roemulsion exhibits a clear to turbid to clear sition. In contrast to the clear regions, the tur- region possesses birefringence. The develop- nt of birefringence is also accompanied by a p decrease in the electrical resistance. The h-resolution (220 megacycle) nuclear magnetic nance data suggest that water exists in two inct molecular environments in the birefringent on; the first environment is characterized by tively less mobile water molecules than oil ecules, whereas in the second environment oil ecules are less mobile than water molecules. electrical, birefringence, and nuclear magnetic nance data are in agreement with the proposed chanism of change in the structure of water n water spheres to water cyclinders to water ellae. The chemical shift of water protons sug- s that the molecular environment of water in eres is different from that of water in cylinders hat of water in lamellae. (Lang-USGS)

THEORETICAL MEAN ACTIVITY COEFFICIENTS OF STRONG ELECTROLYTES IN AQUEOUS SOLUTIONS FROM 0 TO 100 DEG C,
National Bureau of Standards, Washington, D.C. Inst. for Basic Standards.
Walter J. Hamer.
For sale by Superintendent of Documents U.S. Government Printing Office, Washington, D.C. 20402. Price $4.25. National Bureau of Standards Reference Data Series NSRDS-NB24, December 1968. 271 p, 135 tab, 28 ref. NASA Contract R-09-022-029.

Descriptors: *Electrolytes, *Aqueous solutions, *Water chemistry, *Water properties, *Chemical potential, Ionization, Chemical properties, Ions, Data collections, Water quality.
Identifiers: *Activity coefficients (Electrolytes).

Values are tabulated for activity coefficients of electrolytes of various valence types, from 0 to 100 deg C, and for ionic strengths from zero to 0.1 molal or 0.1 molar, as calculated by seven different equations based on the theory of interionic attraction. These equations are those of Debye and Hueckel, Guentelberg, Davies, Scatchard, and Bjerrum, and what may be termed an extended Guentelberg equation and an extended Scatchard equation. (Knapp-USGS)

THE USE OF AMALGAM ELECTRODES TO MEASURE ACTIVITY COEFFICIENTS IN MULTICOMPONENT SALT SOLUTIONS,
Tyco Labs., Inc., Waltham, Mass.
James N. Butler, John C. Synnott, and Rima Huston.
For sale by the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402. Price $1.00. Office of Saline Water Research and Development Progress Report No 606, October 1970. 109 p, 33 tab, 14 fig, 84 ref. OSW Contract 14-01-0001-607.

Descriptors: *Aqueous solutions, Saline water systems, *Desalination, Thermodynamics, Electrolytes, *Electrodes.
Identifiers: Activity coefficient, *Amalgam electrodes.

Research which has been carried out at this laboratory on activity coefficient measurements using amalgam electrodes, glass electrodes, liquid ion-exchange electrodes, and solid state membrane electrodes is briefly reviewed, and the advantages and limitations of each of these methods are discussed. As a primary standard, amalgam electrode measurements are important because of our detailed knowledge of mechanism. Glass electrode measurements give quite accurate activity coefficient data for some systems, but in others show systematic errors which are not yet fully understood. At the present state of the art, liquid ion-exchange electrodes are not extremely stable or selective, but solid state membrane electrodes promise to be superior in both respects, and may provide the possibility of measurements in systems which otherwise could not be studied. (McCoy-Office of Saline Water)

02. WATER CYCLE

2A. General

ANALYSIS OF STOCHASTIC HYDROLOGIC SYSTEMS,
Illinois Univ., Urbana.
Ven Te Chow, and S. J. Kareliotis.
Water Resources Research, Vol 6, No 6, p 1569-1582, December 1970. 14 p, 8 fig, 16 ref. OWRR Project B-038-ILL (1).

Descriptors: *Stochastic processes, *Mathematical studies, *Mathematical models, Systems analysis, Rainfall-runoff relationships, Statistical methods, Probability, Synthetic hydrology, Regression analysis, Statistical models, Time series analysis.
Identifiers: *Stochastic hydrologic systems.

Hydrologic phenomena are in reality stochastic in nature; that is, their behavior changes with the time in accordance with the law of probability as well as with the sequential relationship between the occurrences of the phenonmenon. To analyze the hydrologic phenomenon, a mathematical model of the stochastic hydrologic system to simulate the phenomenon must be formulated. In this study, a watershed is treated as the stochastic hydrologic system whose components of precipitation, runoff, storage, and evapotranspiration are simulated as stochastic processes by time series models to be determined by correlograms and spectral analysis. The hydrologic system model is then formulated on the basis of the principle of conservation of mass and composed of the component stochastic processes. To demonostrate the practical application of the method of analysis so developed, the upper Sangamon River basin above Monticello in east central Illinois is used as the sample watershed. The watershed system model so formulated can be employed to generate stochastic streamflows for practical use in the analysis of water resources systems. (Knapp-USGS)

THE RELATIONSHIP BETWEEN SUMMER LOW FLOWS AND GEOLOGY IN NORTHLAND, NEW ZEALAND,
Ministry of Works, Wellington (New Zealand). Water and Soil Div.
J. R. Waugh.
New Zealand Ministry of Works, Water and Soil Division Miscellaneous Hydrological Publication No 6, 1970. 21 p, 15 fig, 7 tab, 25 ref.

Descriptors: *Rainfall-runoff relationships, *Streamflow, *Low flow, *Hydrogeology, *Subsurface runoff, Hydrologic data, Foreign projects, Gaging stations, Data collections, Runoff, Discharge measurement, Aquifer characteristics, Water yield, Rivers, Flow rates, Rainfall, Hydrographs, Droughts, Streamflow forecasting.
Identifiers: *New Zealand, Northland (New Zealand), Low-flow data.

Flow data from catchments with uniform geology in Northland, New Zealand are used to show that the geology of the catchment area is the most important influence on the low flows. Fifteen catchments, each on a single rock type, were selected for stream gaging. Later, towards the end of the drought, individual measurements were made at other sites to extend the data for mapping purposes. Chart and punched-tape records from five representative basins and one experimental basin also were collected. It was concluded that: 1. The geology of the catchment area is the main influence on the low flows occurring during a drought. 2. The two, three, and four-monthly rainfall totals for drought periods can be used to allocate an approximate frequency to a particular drought. However, the gaging data available from 1962 and 1968 indicated that antecedent rainfall should also be taken into account in allocating a frequency to a drought. 3. The bulk of the 1968 data available for Northland shows that the concept of using representative basins is quite sound, at least for low-flow data. 4. Catchments in the Waipoua and Whangerei regions (basalt and greywacke rocks) have the greatest potential for future water-supply schemes. (Woodard-USGS)
W71-03931

ANALYSIS OF THE RELATION BETWEEN PRECIPITATION AND FLOOD FLOW WITH THE AID OF A TRIPLE TRANSFORMATION BASED ON THE UNIT HYDROGRAPH METHOD (FRENCH),
Transdanubian Water Authority, Szekesehervar (Hungary). Water Management.
G. Bukovszky, and I. Zsuffa.

In: Floods and Their Computation, Vol 1, International Association of Scientific Hydrology Publication No 84 (Unesco-WMO), p 408-419, 1969. 12 p, 4 fig, 13 ref.

Descriptors: *Rainfall-runoff relationships, *Unit hydrographs, *Flood forecasting, Hydrograph analysis, Mathematical studies, Hydraulics, Stream gages, Runoff forecasting.
Identifiers: Hungary.

Direct methods for establishing the unit hydrograph from any observed hyetograph and its corresponding hydrograph are described. The basic difficulty lies in establishing the relationship between total rainfall and runoff. Transition from the relation of precipitation amount--peak discharge at the outlet of the basin is executed in three successive phases: precipitation amount--effective rainfall, surface runoff--runoff concentration, channel flow--peak discharge at the outlet. The approximation is performed on the basis of direct measurements and hydraulic considerations or by way of experiments or by mathematical methods. (Knapp-USGS)
W71-03980

COMPUTATION OF MAXIMUM STORM DISCHARGE OF MOUNTAIN RIVERS,
Akademiya Nauk Armyanskoi SSR, Erevan; and Ministry of Reclamation and Water Economy, Erevan (USSR). Water Problems and Hydrotechnics Research Inst.
I. V. Eguiazarov, and M. V. Tsovyan.
In: Floods and Their Computation, Vol 1, International Association of Scientific Hydrology Publication No 84 (Unesco-WMO), p 396-403, 1969. 8 p, 1 fig, 2 tab, 6 ref.

Descriptors: *Rainfall-runoff relationships, *Frequency analysis, *High water mark, *Flood forecasting, Hydrograph analysis, Peak discharge, Hydrographs.
Identifiers: *USSR.

The lack of necessary field information on storm runoff, particularly pertaining to small mountain rivers, does not permit determination of the design values of maximum discharges on the basis of direct observations for the majority of streams. This leads to the use of flood discharge determination by flood marks. The frequency of flood discharge is determined on the basis of frequency of effective precipitation, or by the period during which one more flood of the same intensity was observed; synthetic flood hydrographs are computed according to the isochrone method. Using the corrected values of runoff coefficients and the transition coefficients from the given frequency to the design frequency one can plot the design runoff hydrograph of the required frequency. (Knapp-USGS)
W71-03982

EVALUATION OF MAXIMUM FLOW OF FLOODS USING PRECIPITATION DATA (FRENCH),
Grenoble Univ. (France).
M. Parde.
In: Floods and Their Computation, Vol 1, International Association of Scientific Hydrology Publication No 84 (Unesco-WMO), p 379-390, 1969. 12 p.

Descriptors: *Rainfall-runoff relationships, *Peak discharge, *Flood forecasting, Data processing, Statistical methods, Runoff forecasting, Depth-area-duration analysis, Unit hydrographs, Hydrograph analysis.
Identifiers: Rainfall floods.

It is possible, by means of precipitation data, to determine the maximum discharges in past floods, or to control and, if necessary, to correct numerical data on floods. Estimation of the peak-flood discharge is recommended as a function of the total liquid volumes compatible with coefficients established for each basin for calculating flood runoff and duration. Interrelations of flood runoff, maximum discharge, and rainfall are duration. The same methods can be used for the estimation of floods caused by exceptional rainstorms. (Knapp-USGS)
W71-03983

FORMATION OF RAINFALL FLOODS ON SMALL WATERSHEDS. PRINCIPLES OF MAXIMUM STORM RUNOFF COMPUTATION,
Vsesoyuznyi Nauchno—Issledovatelskii Institut Vodosnabzheniya, Kanalizatsii, Gidrotekhnicheskikh Sooruzhenii i Inzhenernoi Gidrogeologii, Moscow (USSR); and Khabarovsk Inst. of Railway Engineers (USSR).
I. L. Zimont, and U. G. Suprunov.
In: Floods and Their Computation, Vol 1, International Association of Scientific Hydrology Publication No 84 (Unesco-WMO), p 321-329, 1969. 9 p, 3 fig, 1 photo, 9 ref.

Descriptors: *Rainfall-runoff relationships, *Flood forecasting, Hydraulic similitude, Dimensional analysis, Model studies, Hydrograph analysis, Hydraulic models, Simulated rainfall.
Identifiers: Watershed models.

A description of experiments on flood formation in field and laboratory conditions is presented. On the basis of the theory of similitude and the dimensionality method, modelling conditions are suggested, which may be used for flood prediction on small basins. A method is suggested which allows plotting outline of the hydrograph for the experimental basin if data on precipitation are available. (Knapp-USGS)
W71-03988

CALCULATION OF THE MAXIMUM RUNOFF IN FLOODS FROM RAINFALL OVER THE TERRITORIES OF THE UKRAINE AND MOLDAVIA (WITH NO OR INSUFFICIENT HYDROMETRICAL DATA),
Ukrainskii Nauchno-Issledovatelskii Gidrometeorologicheskii Institut, Kiev (USSR).
P. F. Wishnevsky.
In: Floods and Their Computation, Vol 1, International Association of Scientific Hydrology Publication No 84 (Unesco-WMO), p 483-492, 1969. 10 p, 1 fig.

Descriptors: *Rainfall-runoff relationships, *Depth-area-duration analysis, *Routing, *Runoff forecasting, Water yield, Rainfall intensity, Flood plains, Probability, Flood forecasting.
Identifiers: USSR.

Available observation records of Ukrainian rainfall and runoff were used to design a method of maximum flood runoff calculation. For the calculation of maximum discharges a formula is suggested, which considers basic components of the runoff formation mechanism, including the value and duration of water yield and time lag. L0cal specific features of basins are taken into consideration. The calculation parameters of the formula are worked out on the basis of observations available. Reduction of the maximum runoff is considered according to the time lag. For the calculation of flood runoff volumes, two types of relationship are worked out for mountain and plain territories. THE WORLD OF WATER,
Minnesota Univ., Minneapolis. Water Resources Research Center.
William Clarence Walton.
New York, NY, Taplinger Publishing Company, 1970. 318 p, 3 fig, 25 plate, 42 ref.

Descriptors: *Water resources, *Reviews, *Earth (Planet), *Hydrologic cycle, *Hydrology, Surface waters, Groundwater, Atmosphere, Water properties, Precipitation (Atmospheric), Evapotranspiration, Meteorology, Climatology, Oceans, Curre (Water), Tides, Waves (Water), Temperatu Water chemistry, Soil moisture, Aquifers, Lak Swamps, Reservoirs, Streams, Flood contr Water supply, Sewage, Dams, Recreation, Wildli Water conservation, Planning, Manageme Synoptic analysis.

An attempt is made to present, in nontechnical la guage, a digest of facts to inform the intellige general reader about water and its relation to ev day life. The information presented has been lar ly abstracted from the references listed at the e of the book. The oceans, ice caps, glaciers, subs face reservoirs, lakes, swamps, surface reservoi streams, and atmosphere contain the earth's to water. The physical aspects of these subjects a reviewed in this book together with biologic recreational, wildlife, economic, legal, and soc aspects. Some of the measures taken by man develop and manage water resources and the effects of man's activities on the environment a discussed. The problem of water conservation stressed. (Woodard-USGS)

ISOTOPE HYDROLOGY, 1970.
International Atomic Energy Agency, Vien (Austria).

Proceedings Symposium of International Atom Energy Agency and UNESCO, Vienna, March 13, 1970: Vienna, International Atomic Ener Agency STI/PUB/255, 1970. 918 p.

Descriptors: *Tracers, *Radioactivity technique *Radioactive dating, *Radioisotope *Hydrogeology, Water balance, Sedimentatio Sedimentology, Conferences, Hydrology, Groun water movement, Surface waters, Estuarie Hydrologic cycle, International Hydrologic Decade.
Identifiers: *International Atomic Energy Agency

The Third Symposium on the Use of Isotopes i Hydrology, which took place in Vienna on 9-1 March 1970, was organized by the Internation Atomic Energy Agency in cooperation with th United Nations Educational, Scientific and Cu tural Organization. The development of isotop hydrology, which is a useful tool for practicin hydrologists, has an interdisciplinary history. Th early work was done by isotope specialists. As th various techniques evolved, hydrologists becam interested in its potential. At the symposium ther was a balance between these two types of worker which indicates that the research has develope into practical working methods. The determinatio of groundwater parameters for a growing popula tion, and the sedimentation of harbors and river are two of the major problems discussed at the sym posium. The 59 papers presented in 9 sessions: en vironmental isotopes in the water cycle; carbon-1 dating of groundwater; field use of environmenta isotope methods; tracer studies of surface waters sediment studies; borehole techniques and nuclea instruments; canal and reservoir leakage; computa tion; and new techniques in tracing and dating (See also W71-04134 thru W71-04142) (Knapp USGS)

teorology, Precipitation (Atmospheric), rms, Streamflow, Lakes, Evapotranspiration, lout, Distribution patterns.
ntifiers: *Canada, *Hydrogen isotope distribu- (Canada).

e passage of bomb tritium through natural water ems in Canada has been followed since 1954. ently the distribution of deuterium in precipita- and surface waters has been studied. These give valuable information on the continental er cycle and the turnover characteristics of in- dual river basins. Tritium and deuterium con- trations vary inversely in natural waters. Low centrations of tritium and high concentrations euterium occur in coastal regions which receive first condensate from oceanic vapor. As the sture moves inland, it picks up more tritium the atmosphere and is depleted in deuterium referential condensation of HDO. This pattern articularly marked in northern and western ada where low temperatures and mountain bar- across the weather tracks from the Pacific ce the deuterium content of the limited unt of moisture reaching central Canada. In east, absence of mountain barriers across ther tracks from the Gulf of Mexico results in relatively high deuterium concentrations in hern Ontario and Quebec. Storm-to-storm uations in isotope content of precipitation at wa reflect a variability in the origin of ipitating moisture. Seasonal variation of triti- due to late spring feed-in from the strato- re, has been particularly prominent and regu- t Canadian latitudes. Declining annual peak centrations since 1963 indicate depletion of the ospheric reservoir with a half-time of 1.2 years. also W71-04133) (Knapp-USGS)

ifiers: *Oxygen isotopes, *Czechoslovakia.

tion of the tritium and oxygen-18 content of precipitation and the snowpack during the r of 1965-1966 and the following snowmelt n was studied in a small mountain basin in ern Czechoslovakia. A significant altitude ef- exists for oxygen-18 when the precipitation is n the solid form. Evolution of the isotopic osition of the snowpack reflects the move- of meltwater in the snowpack and its relation e thermal conditions in the snowpack. Early melt percolates through the snowpack without mixing with the snow matrix. At the middle e snowmelt period the meltwater mixes with ater in the lower layers during the percolation e water through the snowpack. A pseudo-al- e effect is observed in the snowpack due to the pearance of the isotopically light early winter from the lower altitudes which are subject to mittent melting during the winter months. also W71-04133) (Knapp-USGS)

DEUTERIUM MEASUREMENTS ON SNOW SAMPLES FROM THE ALPS,
Gesellschaft fuer Strahlenforschung m.b.H., Munich (West Germany). Institut fuer Radiohydrometrie.
H. Moser, and W. Stichler.
In: Isotope Hydrology, 1970, Proceedings Symposium of International Atomic Energy Agency and UNESCO, Vienna, March 9-13, 1970: Vienna, International Atomic Energy Agency STI/PUB/255, Paper No SM-129/4, p 43-57, 1970. 15 p, 11 fig, 2 tab, 7 ref.

Descriptors: *Deuterium, *Snowpacks, *Altitude, *Distribution patterns, Snowmelt, Melt water, Precipitation (Atmospheric), Water balance, Hydrologic budget, Evaporation, Melting, Runoff, Tracers, Rainfall.
Identifiers: *Switzerland, *Alps.

Measurements of the deuterium content of snow samples from different regions of the western and eastern Alps revealed a general difference between samples of fresh snow and pack snow. The deuterium content of fresh snow was found to decrease approximately linearly with increase in elevation. The variation was about -4 parts per thousand per 100 m rise in elevation, and the deuterium content corresponded to that measured for rain in Central Europe. Pack snow, on the other hand, showed an increase in deuterium content with rise in elevation which, for the samples examined, fell within about ..5 parts per thousand per 100 m rise in elevation. Natural snow samples were used to follow and interpret the variation with time of the deuterium content caused by the aging of the snow. In addition to the dependence of the deuterium content on elevation, the annual pattern of the deterium content of snow samples corresponds to the known curve for deuterium in precipitation. (See also W71-04133) (Knapp-USGS)
W71-04136

EXCHANGE OF DEUTERIUM BETWEEN ICE AND WATER IN GLACIOLOGICAL STUDIES IN ICELAND,
Iceland Univ., Reykjavik. Science Inst.
B. Arnason.
In: Isotope Hydrology, 1970, Proceedings Symposium of International Atomic Energy Agency and UNESCO, Vienna, March 9-13, 1970: Vienna, International Atomic Energy Agency STI/PUB/255, Paper No SM-129/5, p 59-71, 1970. 13 p, 6 fig, 1 tab, 17 ref.

Descriptors: *Deuterium, *Glaciers, *Regimen, *Melting, *Melt water, Ice, Cryology, Climatology, Hydrologic budget, Water balance, Radioactive dating, Movement, Paleoclimatology, Precipitation (Atmospheric), Altitude, Water sources.
Identifiers: *Iceland, *Iceland ice cap.

The annual variation of deuterium concentration in precipitation in Iceland is small. This makes it possible to estimate the mean annual deuterium concentration in the precipitation on Icelandic glaciers by collecting samples of the winter layer before the beginning of the melting season. Ice cores collected from several boreholes on the glaciers, ranging in depths up to more than 100 m, were analyzed for their deuterium content. Extensive homogenization, which takes place in the uppermost winter layer during summer thaws, may be ascribed to an isotope exchange between ice and water in temperate glaciers. In the autumn, the deuterium concentrations in ice and water approach isotopic equilibrium at least up to an altitude of 1300 m. The isotope ratio can therefore be used for estimating the runoff ratio. This ratio, together with measurements of the amount of retained precipitation in previous annual layers, gives the amount of total yearly precipitation on temperate glaciers. The results are in good agreement with available data obtained independently. At an altitude of 2000 m deuterium measurements show that the yearly precipitation is totally accumulated. Therefore, at this altitude the deuterium concentration of an ice core collected by drilling through the ice cap may reflect the past climatic changes as o-18 does on polar glaciers. Small variations in the mean annual temperature are reflected in variations of the deuterium concentration of the ice core. (See also W71-04133) (Knapp-USGS)

WATER MOVEMENT IN THE UNSATURATED ZONE OF HIGH AND LOW PERMEABILITY STRATA BY MEASURING NATURAL TRITIUM,
Atomic Energy Research Establishment, Wantage (England). Research Lab.; Water Resources Board, Reading (England); and Hydrological Research Unit, Wallingford (England).
D. B. Smith, P. L. Wearn, H. J. Richards, and P. C. Rowe.
In: Isotope Hydrology, 1970, Proceedings Symposium of International Atomic Energy Agency and UNESCO, Vienna, March 9-13, 1970: Vienna, International Atomic Energy Agency STI/PUB/255, Paper No SM-129/6, p 73-87, 1970. 15 p, 6 fig, 7 ref.

Descriptors: *Groundwater movement, *Soil water movement, *Recharge, *Tracers, *Tritium, Unsaturated flow, Percolation, Limestones, Clays, Porous media, Tracking techniques, Model studies, Rainfall-runoff relationships, Surface-groundwater relationships, Distribution patterns, Rainfall, Precipitation (Atmospheric), Water balance, Evapotranspiration.
Identifiers: *England, Chalk.

Measurement of the natural tritium concentration in groundwater samples from a vertical profile in the unsaturated zone of a formation provides information on the downward movement of water in the strata. The tritium profiles are evaluated in terms of hydrological models to examine the mechanism of water recharge. Tritium measurements in the Chalk of England show that downward movement is principally by intergranular seepage with a smaller component of movement through crack systems. Two hydrological models offer alternative interpretation of the water recharge. Tritium measurements in a low-permeability clay show the downward movement of water by intergranular seepage and indicate that recharge occurs by replenishment of the summer soil moisture deficit by autumn rainfall. QUANTITATIVE ASPECTS OF THE STUDY OF WATER BALANCES IN LAKES USING THE DEUTERIUM AND OXYGEN-18 CONCENTRATIONS IN THE WATER, (FRENCH),
Commissariat a l'Energie Atomique, Saclay (France). Centre d'Etudes Nucleaires.
Liliane Merlivat.
In: Isotope Hydrology, 1970, Proceedings Symposium of International Atomic Energy Agency and UNESCO, Vienna, March 9-13, 1970: Vienna, International Atomic Energy Agency STI/PUB/255, Paper No SM-129/7, p 89-107, 1970. 19 p, 9 fig, 2 tab, 14 ref.

Descriptors: *Water balance, *Lakes, *Deuterium, *Oxygen, Limnology, Tracers, Tracking techniques, Evaporation, Precipitation (Atmospheric), Recharge, Discharge (Water), Water sources, Water circulation, Diffusion, Mixing, Model studies, Hydraulic models, Mass transfer, Advection.
Identifiers: France, *Oxygen isotopes.

Water in a reservoir which is subjected to relatively strong evaporation has an O-18 content different from that of its recharge water. The processes responsible for the modification of the isotopic composition of the water in a reservoir in relation to its recharge water are summarized. In the proposed O-18 diagram both deuterium and O-18 give the same information and measuring both should indicate the accuracy of the method. The measurable quantity is the ratio between evapora-

tion and recharge. The numerical value of this ratio closely depends on the water vapor transport equation used in the diagram, in particular the relation between the evaporation rate and the diffusion coefficient. Measurements of evaporation in a tunnel under laminar flow conditions are described in some detail. Under these flow conditions the mass transport equations are well known and can be solved numerically by computers. The evaporation rate and the related isotope effects in given experimental conditions can then be calculated exactly. The extent to which the results obtained with deuterium and oxygen-18 depend on the hypotheses that have to be made in the absence of complete knowledge of all the parameters. ENVIRONMENTAL ISOTOPE BALANCE OF LAKE TIBERIAS,
Weizmann Inst. of Science, Rehovoth (Israel).
J. R. Gat.
In: Isotope Hydrology, 1970, Proceedings Symposium of International Atomic Energy Agency and UNESCO, Vienna, March 9-13, 1970: Vienna, International Atomic Energy Agency STI/PUB/255, Paper No SM-129/8, p 109-127, 1970. 19 p, 11 fig, 21 ref.

Descriptors: *Water balance, *Lakes, *Deuterium, *Oxygen, Limnology, Tracers, Tracking techniques, Evaporation, Precipitation (Atmospheric), Recharge, Discharge (Water), Water sources, Water circulation, Diffusion, Mixing, Mass transfer, Advection.
Identifiers: *Israel, *Lake Tiberias (Israel).

The stable isotope composition and tritium content of Lake Tiberias (Sea of Galilee or Lake Kinneret) has been monitored for over ten years. The O-18 concentration in the upper water mass undergoes a yearly cycle of average amplitude of 0.5 parts per thousand. The hypolimnion follows the change at much reduced amplitude. Deuterium concentrations change in a similar manner with 5.3 times the variation of O-18. The mean yearly isotope composition shifts up to 1.5 parts per thousand for O-18 as a result of hydrological imbalances between water gain and losses. Detailed balance calculations based on available hydrological and climatic data were made and their reliability discussed. In particular, the effect of vertical stratification and the magnitude of separation coefficients were explored. It is shown that controlled evaporation experiments can give more pertinent data on the exchange fluxes of both tritium and stable isotopes than calculations based on time-averaged humidity data. From such evaporation experiments using thermostatted pans, effective isotope fractionation factors for O-18 and deuterium evaporation were determined and shown to depend on the degree of atmospheric turbulence and the stability in the surface layer. STABLE ISOTOPES IN STUDY OF WATER BALANCE OF LAKE NEUSIEDL, AUSTRIA: INVESTIGATION OF THE RELIABILITY OF THE STABLE ISOTOPE METHOD,
Heidelberg Univ. (West Germany). Physikalisches Institut (II).
U. Zimmermann, and D. H. Ehhalt.
In: Isotope Hydrology, 1970, Proceedings Symposium of International Atomic Energy Agency and UNESCO, Vienna, March 9-13, 1970: Vienna, International Atomic Energy Agency STI/PUB/255, Paper No SM-129/9, p 129-138, 1970. 10 p, 2 fig, 2 tab, 13 ref.

Descriptors: *Water balance, *Lakes, *Deuterium, *Oxygen, Limnology, Tracers, Tracking techniques, Evaporation, Evapotranspiration, Precipitation (Atmospheric), Recharge, Discharge (Water), Water sources, Water circulation, Diffusion, Mixing.
Identifiers: *Austria, *Lake Neusiedl (Austria).

The isotopic composition of a lake depends on its water balance; therefore the balance equations of stable isotopes provide information for evaluating the water balance. The main source of error is that of the isotope content of the moisture evaporating from the lake. Errors in the isotope content of the lake water and its variation with time are also important. Stable isotope measurements were used to study the water balance of Lake Neusiedl near Vienna. Since 1965 the isotope content of rain, river water, groundwater, and lake water have been determined. Water vapor has been collected continuously since March 1968. Even where all isotope data are determined with good accuracy, it can be difficult to determine the evaporation rate of a lake with an accuracy better than 50%. (See also W71-04133) (Knapp-USGS)

PERCH LAKE EVAPORATION STUDY,
Atomic Energy of Canada Ltd., Chalk River (Ontario). Chalk River Nuclear Labs.
P. J. Barry, and W. F. Merritt.
In: Isotope Hydrology, 1970, Proceedings Symposium of International Atomic Energy Agency and UNESCO, Vienna, March 9-13, 1970: Vienna, International Atomic Energy Agency STI/PUB/255, Paper No SM-129/10, p 139-151, 1970. 13 p, 3 fig, 1 tab, 2 ref.

Descriptors: *Lakes, *Water balance, *Evaporation, *Tracers, *Tritium, Groundwater movement, Surface-groundwater relationships, Hydrogeology, Trace elements, Energy budget.
Identifiers: *Canada, *Perch Lake (Ontario).

The Perch Lake project used radioactive tracers in the study of all aspects of the hydrological cycle in a small, well-defined basin. The use of tritiated water vapor for the study of evaporation mechanisms in a natural setting is believed to be unique. Other studies include the determination of the water, tritiated water, energy and trace element budgets of the lake of which the first three complement the use of tritiated water vapor to study basic evaporation mechanisms. Radioactive tracers have been used particularly for estimating the groundwater components of the water and tritium budgets. Groundwater flows predicted by the use of conventional hydrological techniques as well as various new flow models are being compared with the results obtained using radioactive tracers. Perch Lake is a small (0.45 sq km) lake on the property of Atomic Energy of Canada Limited at Chalk River, Ontario. It contains about 400 pCi/ml of tritium coming from the liquid disposal area operated by the Chalk River Nuclear Laboratories. Waste solutions containing several thousands of curies of tritium are discharged annually into pits in the ground and then move both in the surface and groundwaters of Perch Lake swamp into the lake. One small creek provides the only outlet for surface water for the whole basin. (See also W71-04133) (Knapp-USGS)

A SIMPLE CASCADE WATERSHED MODEL,
California Univ., Davis. Dept. of Water Science and Engineering.
Jaime Amorocho, and Gary Leroy Guymon.
California University Water Resources Center Report, August 1969. 16 p, 4 fig, 2 tab, 8 ref. OWRR Project B-005-CAL (3).

Descriptors: *Mathematical models, *Simulation analysis, *Rainfall-runoff relationships, Runoff forecasting, Synthetic hydrology, Groundwater movement, Surface-groundwater relationships, Evaporation, Routing.
Identifiers: *Cascade watershed-model.

The applicability of a simple cascade model to a real watershed is examined; the model is composed of a soil water submodel and a linear streamflow routing model cascaded together. The model roughly represents hourly instantaneous watershed outflows. The errors associated with the model can be minimized by further adjustments to the mod The soil water submodel consists of a watersh divisible into a variable number of 3-dimensio zones occupying some unknown space in watershed. The zones have an ordered effect on evapotranspiration and runoff process. One rain station is used as an index of hourly input to prototype watershed and daily pan evaporati data is used to estimate hourly evaporation. Fr these data, the soil water submodel estima hourly rainfall excess. (Knapp-USGS)

Identifiers: *Potential evapotranspiratio *Thorthwaite's formula, *Climatic classificatio *Global studies, Continents, Hemispheres, Afric Asia, Australia, South America.

An attempt is made to understand recent climati variations from the standpoint of spatial variatio of arid climatic regions. Since variations in arid cl mates seem to reflect secular variations of gener circulation, it is important to determine whethe recent world climatic variations take place on global scale, on a hemispheric unit or on a co tinental scale. Monthly aridity is defined on th basis of the precipitation (P)/evaporation (E) rati which corresponds to Thornthwaite's P-E ratio. the ratio is less than 1 for any month, it is termed 'dry month'. An arid region is defined as any regio in which every month is a dry month. Usin precipitation and temperature data from a numbe of years over the past half century, the P-E rati was calculated for each month of the year and fo all continents except those latitudinal region where mean monthly temperatures fell below -1 deg. C. All arid region boundaries were the defined, and their variation over time was deter mined. Climatic conditions forming arid region varied from year to year, and the variation was al ways greater on the east side than the west. How ever, in the period 1931-1960 no remarkable changes with a definite tendency were found. Frequency distributions had generally large vari ances, indicating complicated arid zone formation factors. In yearly fluctuations hemispheric scale variations predominated over those on a global scale and relationships between climatic variations in the northern and southern hemispheres were in significant. The large variability in arid region patterns shows the characteristics of climate itself, reflecting conditions of atmospheric circulation. (Casey-Arizona)

cipitation and snowfall accumulation of known
bability as determined by analysis of past
ords are utilized in the preparation of probabili-
runoff forecasts. The forecasts include an
luation of the standard error of the prediction
del. The forecasts are presented at three levels
obability as follows: 1. Most Probable - That
off which is expected to occur if precipitation
equent to the date of forecast is median. 2.
sonable maximum - That runoff which is ex-
ed to occur if precipitation subsequent to the
of forecast is equal to the amount which is ex-
ded on the average once in ten years. 3.
sonable Minimum - That runoff which is ex-
ed to occur if precipitation subsequent to the
of forecasting is equal to the amount which is
eeded on the average nine out of ten years. The
t Probable forecast for a forecast period is
n in thousands of acre-feet and in percent of
15-year average. The Reasonable Maximum
Reasonable Minimum forecasts are shown in a
lar manner. The 15-year average flow for the
cast period for 1953 through 1967 and other
ed data are included. (Woodard-USGS)

PREDICTION OF SOLAR AND ATMOSPHERIC RADIATION FOR ENERGY BUDGET STUDIES OF LAKES AND STREAMS,
Florida Univ., Gainsville. Dept. of Environmental Engineering.
W. C. Huber.
Available from NTIS as PB-197 267, $3.00 in paper copy, $0.95 in microfiche. Florida Water Resources Research Center Publication No 10, October, 1970. 128 p, 1 tab, 12 fig, 25 ref, 2 append. OWRR Project A-014-FLA (1).

Descriptors: *Solar radiation, *Radiation, *Energy budget, *Heat budget, Temperature distribution, Hydrologic cycle, Thermal stratification, *Temperature, Lakes, Reservoirs, Thermal radiation, Geothermal studies, Heat balance, Florida, Humidity, Cloud cover, Meteorological data.
Identifiers: Temperature change, Thermal change, Atmospheric radiation, Shortwave radiation, Newman's Lake (Fla), Radiation data.

Evaluation of terms in the energy budget is an integral part of the prediction of thermal changes in natural water bodies. These lakes, reservoirs, streams, and tidal waters receive heat from shortwave solar radiation, longwave atmospheric radiation, and advectively from surface water inflows. The net advective heat flux if often zero, in which case the radiation components are the dominant causes of temperature changes. Predictive methods for the two radiation components have been developed as a function of meteorological parameters alone, (e.g. temperature, humidity, cloudiness, opaqueness). These predictive methods can be used in areas where there are no records of radiation measurements since the required meteorological variables are commonly measured at weather stations and airports. A better predictive equation was found for shortwave radiation than for longwave radiation, due possibly to local climatic conditions and possible errors in portions of the longwave radiation measurements. Use of the shortwave equations in evaluating temporal temperature changes in a Florida lake resulted in good agreement with measured values. A tabulation of 148 days of hourly radiation and meteorological values is included in the report.

ENVELOPE-FREQUENCY RELATIONS FOR MAXIMUM FLOODS IN MONSOON AREAS OF THE ECAFE REGION.
Economic Commission for Asia and the Far East (UN), New York.

Water Resources Journal, United Nations Economic Commission for Asia and the Far East (ECAFE), p 1-11, June 1970. 11 p, 5 fig, 3 tab.

Descriptors: *Flood forecasting, *Frequency analysis, *Design flood, *Monsoons, *Typhoons, Tropical regions, Wet seasons, Rainfall-runoff relationships, Frequency, Design storm, Warning systems, Peak discharge.
Identifiers: *ECAFE, *Asia.

Of all the factors influencing floods in the ECAFE region, monsoons play the most important role. Design flood envelope curves were determined by fitting a smooth curve through the three outermost points of plotted data. These three controlling points were also used to determine the envelope curve equations for each subregion. In general, the envelope-frequency relations derived in this paper are satisfactory for use by water resources engineers in planning the development of ungaged rivers in the ECAFE region, particularly where data are nonexistent or are inadequate. The most reliable envelopes are those with return periods of 50 years. The 100-year curves are fairly reliable. (Knapp-USGS)

QUANTITATIVE REGIONAL PREDICTION OF RAINFALL IN ECAFE REGIONS,
Meteorological Office, Poona (India).
E. V. Chelam.
In: Forecasting of Heavy Rains and Floods, Proceedings Joint Seminar of Regional Associations 2 and 5 of World Meteorological Organization, Nov 11-23, 1968, Kuala Lumpur, Malaysia, published by World Meteorological Organization, Geneva, p 11-20, 1970. 10 p.

Descriptors: *Weather forecasting, *Synoptic analysis, *Monsoons, *Precipitation (Atmospheric), Atmospheric physics, River forecasting, Wet seasons, Weather patterns, Cloud physics, Meteorology, Floods, Flood forecasting, Fronts (Atmospheric).
Identifiers: *ECAFE, *Asia.

Forecasting of heavy rainfall, with particular reference to quantitative predictions, and with a bearing on the ECAFE region, is discussed. Heavy precipitation is caused by vertical ascent of saturated air. Techniques for assessing and forecasting moisture content and vertical velocity are described, using the concept of precipitable water and the forced ascent of air at an orographic barrier or a dynamic barrier (for example at a frontal surface) or due to horizontal mass convergence. Physical methods of quantitative estimates, statistical techniques employing scatter diagrams, and numerical methods which involve solution of the vertical velocity equation with the aid of an electronic computer are described with special attention given to the applicability of these techniques to the ECAFE region. The synoptic systems which gave heavy rainfall in the region such as depressions, typhoons, convergence zones, mountain waves, etc., are described, and case studies involving applications of the techniques described earlier to these systems are presented. (Knapp-USGS)

VERTICAL VELOCITY AND RAINFALL COMPUTATION,
Meteorological Office, Poona (India).
E. V. Chelam.
In: Forecasting of Heavy Rains and Floods, Proc Joint Seminar of Regional Associations 2 and 5 of World Meteorological Organization, Nov 11-23, 1968, Kuala Lumpur, Malaysia, published by World Meteorological Organization, Geneva, p 21-25, 1970. 5 p, 36 ref.

Descriptors: *Weather forecasting, *Synoptic analysis, *Monsoons, *Precipitation (Atmospheric), Atmospheric physics, River forecasting, Wet seasons, Weather patterns, Cloud physics, Meteorology, Floods, Flood forecasting, Fronts (Atmospheric).
Identifiers: *ECAFE, *Asia.

Formulas used to estimate quantitatively the magnitude of likely rainfall over an area from a vertically ascending mass of saturated air, are reviewed. The basic assumption in many of these attempts is either to ignore the horizontal wind field or treat it as nondivergent. Such an assumption is open to serious objections considering the fact that the observed wind field is seldom nondivergent; moreover, no appreciable vertical velocities (which alone could lead to rainfall) should be expected in a nondivergent wind field. It can be shown that a formula which is substantially of the form as developed by Fulks and Showalter can be derived without recourse to any assumptions about nondivergence of the wind field. The treatment can be easily extended for a case where the air is not fully saturated. In this case, part of the moisture flowing in will go to saturate the moist air and the rest of the excess flow will result in precipitation. The rainfall amounts will then be diminished to the extent of the difference between the unsaturated content of humidity in the air and its saturated value. (Knapp-USGS)

Identifiers: *ECAFE, *Asia.

Rainfall in the tropics and subtropics may occur in the form of scattered showers or widespread rain. Forecasts of rain usually depend on the detection of extensive zones of convergence associated with some types of disturbances and on the assumption that the rain is general. The verification of rain occurrence is difficult if the purpose is to distinguish between days on which rain is recorded and those on which no rain occurs. Obviously, a single point of observation over a large area is insufficient. Methods used to obtain an accurate appraisal of the distribution of rainfall and to determine the representativeness of an individual randomly placed rain gage are reviewed. (Knapp-USGS)

RAIN FROM TROPICAL CYCLONES AND TROUGH-TYPE SYSTEMS,
Royal Observatory, Hong Kong. Div. of Research and Climatology.
P. C. Chin.
In: Forecasting of Heavy Rains and Floods, Proc Joint Seminar of Regional Associations 2 and 5 of World Meteorological Organization, Nov 11-23, 1968, Kuala Lumpur, Malaysia, published by World Meteorological Organization, Geneva, p 54-72, 1970. 19 p, 10 fig, 1 tab, 22 ref.

Descriptors: *Synoptic analysis, *Monsoons, Rainfall, Precipitation (Atmospheric), Atmospheric physics, Climatology, Frequency, Frequency analysis, Weather forecasting, Meteorology, Regions, Weather forecasting, Flood forecasting.
Identifiers: *ECAFE, *Asia.

Heavy rainfall over the various regions in Southeast Asia is generally associated with tropical cyclones; monsoon depressions and cyclonic vortices; quasi-stationary or slow-moving fronts, troughs and convergence zones; and easterly or westerly moving troughs or vortices in the upper levels. The primary feature of these disturbances is a relatively extensive area of convergence where local heavy rain, which may be in the form of showers, is embedded in a larger area of 'background' rainfall. It is generally known that rainfall is usually enhanced by the simultaneous presence of surface and upper-air disturbances. Studies in Hong Kong reveal that extreme rains are mostly due to intense convective cells embedded in troughs and in tropical cyclones, so that both types form the controlling systems for this region. ANALYSIS OF MESOSCALE SYSTEMS,
Royal Observatory, Hong Kong. Div. of Research and Climatology.
P. C. Chin.
In: Forecasting of Heavy Rains and Floods, Proc Joint Seminar of Regional Associations 2 and 5 of World Meteorological Organization, Nov 11-23, 1968, Kuala Lumpur, Malaysia, published by World Meteorological Organization, Geneva, p 73-90, 1970. 18 p, 8 fig, 1 tab, 13ref.

Descriptors: *Weather forecasting, *Meteorology, *Radar, Synoptic analysis, Weather patterns, Monsoons, Precipitation (Atmospheric), Atmospheric physics, Wet seasons, Floods, Fronts (Atmospheric).
Identifiers: *Mesoscale weather-systems, *ECAFE, *Asia.

The importance of mesoscale features has long been recognized in synoptic studies of cold fronts and thunderstorms. These systems can be identified and followed as entities with good continuity from hour to hour and are associated with most of the severe weather experienced in Southeast Asia. The characteristics of mesosystems are different from those of synoptic systems. In mesosystems, life time is of the order of a few hours and the height-diameter ratio is large. Their flow pattern is characterized by departures from hydrostatic equilibrium. For small-size convective systems, the effect of Coriolis force is relatively unimportant and the feeble entrainment rate would also allow the conventional parcel method to be used to estimate instability, but condensation and evaporation are important from the energy-transfer point of view. In Hong Kong, short-period forecasts of rainfall amount are prepared by analyzing the shape, movement and, whenever possible, the decay characteristics of storm cells as revealed by a 10-cm radar. The data are fed into a small desk-top computer and the expected rainfall at a point for various durations can be computed in a few minutes. (Knapp-USGS)
W71-04157

SURVEY OF OBJECTIVE METHODS USED IN HONG KONG FOR PREDICTING TYPHOON MOVEMENT,
Royal Observatory, Hong Kong. Div. of Research and Climatology.
P. C. Chin.
In: Forecasting of Heavy Rains and Floods, Proc Joint Seminar of Regional Associations 2 and 5 of World Meteorological Organization, Nov 11-23, 1968, Kuala Lumpur, Malaysia, published by World Meteorological Organization, Geneva, p 91-112, 1970. 12 p, 2 fig, 5 tab, 11 ref.

Descriptors: *Typhoons, *Tropical cyclones, *Weather forecasting, Flood forecasting, Atmospheric physics, Forecasting, Synoptic analysis, Weather patterns, Meteorology, Storms.
Identifiers: *Typhoon forecasting, *ECAFE, *Asia.

The development of a reliable system by which typhoon forecasts can be issued early enough for people to take the necessary measures to protect their lives and property is a serious necessity in Southeast Asia and the Tropical Pacific. To satisfy operational needs, the forecast method must provide a good average level of accuracy and should not be unduly dependent on fine detail in the analysis of the basic data. Recent objective techniques for forecasting typhoon movement produce satisfactory results. During 1961, the Hong Kong Royal Observatory initiated a program to test the operational value of several of these techniques. On the whole, the mean errors given by the Veigas-Miller, Tse and persistence climatology methods were found to be less than those given by the nonobjective forecasts of the Observatory. The results given by the persistence climatology method were particularly encouraging. An analysis of the errors associated with individual storms confirmed the previous finding that no method was consistently better for all storms and no method was consistently better for any one storm with a life period of 3 days or more. CTURE 3 - STORM MAXIMIZATION CHNIQUES IN EQUATORIAL/TROPICAL GIONS,
eau of Meteorology, Melbourne (Australia). vice Div.
. Rainbird.
Forecasting of Heavy Rains and Floods, Proc nt Seminar of Regional Associations 2 and 5 of rld Meteorological Organization, Nov 11-23, 8, Kuala Lumpur, Malaysia, published by rld Meteorological Organization, Geneva, p -196, 1970. 6 p, 5 ref.

criptors: *Probable maximum precipitation, sign flood, Estimating, Statistical methods, del studies, Data collections, Maximum proba-flood, Weather data, Weather forecasting, ud physics.
Identifiers: *ECAFE, *Asia.

The storm moisture adjustment technique has been used extensively in extratropical regions to maximize observed storm rainfalls. However, it is recognized that this technique is not of equal value in all climatic regions of the world, and there are strong limitations to its use in the equatorial/tropical regions. In these regions, very high atmospheric moisture is present for most or all of the time in the rainy season. There is no apparent direct relationship between the minor day-to-day fluctuations observed in atmospheric moisture, and the occurrence of 'normal' wet season rains on one day, and of very heavy rain on another. Two maximization studies for tropical areas are described to illustrate approaches to the special problems posed by these regions. Subjective judgement must be exercised at a number of stages when estimating PMP for a river basin by storm maximization and transposition techniques. Deficiencies in quality or quantity of historical data and uncertainty in applying any of the procedures must be compensated by increased safety margins. (See also W71-04160) (Knapp-USGS)

LECTURE 4 - ESTIMATION OF PMP AND MAXIMUM FLOODS BY STATISTICAL METHODS,
Bureau of Meteorology, Melbourne (Australia). Service Div.
A. F. Rainbird.
In: Forecasting of Heavy Rains and Floods, Proc Joint Seminar of Regional Associations 2 and 5 of World Meteorological Organization, Nov 11-23, 1968, Kuala Lumpur, Malaysia, published by World Meteorological Organization, Geneva, p 197-205, 1970. 9 p, 9 ref.

Descriptors: *Probable maximum precipitation, *Design flood, Estimating, Statistical methods, Model studies, Data collections, Maximum probable flood, Weather data, Weather forecasting, Cloud physics.
Identifiers: *ECAFE, *Asia.

Methods of estimating probable maximum precipitation PMP involve a high degree of subjective judgment and decision. More objective methods of estimating PMP and maximum floods are desirable. The use of techniques in mathematical statistics for these purposes is reviewed. Because statistical methods involve mathematical computation and have the appearance of objectivity, there is a danger that greater confidence may be given to the end results than is really justified. Use of a statistical technique to estimate PMP or a maximum flood involves the assumption that the particular technique used is appropriate and relevant for those purposes. This assumption is usually also based on judgment rather than on mathematical proof. The various estimates derived by different approaches will at least indicate the range of possibilities and will help point to cases where inherent uncertainties justify a conservative approach in project design. SEVERE CYCLONIC STORM RESPONSIBLE FOR FLASH FLOOD IN PAKOKKU AND MONYWA DISTRICTS DURING THE MONTH OF OCTOBER 1967,
Burma Meteorological Dept., Rangoon.
Htay Aung.
In: Forecasting of Heavy Rains and Floods, Proc Joint Seminar of Regional Associations 2 and 5 of World Meteorological Organization, Nov 11-23, 1968, Kuala Lumpur, Malaysia; published by World Meteorological Organization, Geneva, p 213-220, 1970. 8 p, 5 fig.

Descriptors: *Floods, *Rainfall-runoff relationships, *Flash floods, Antecedent precipitation, Rainfall intensity, Storms, Cloudbursts, Tropical regions, Tropical cyclones.
Identifiers: *ECAFE, *Burma.

Heavy rains which occurred on October 23-24, 1967 caused a flash flood in the Pakokku and Monywa districts of central Burma. The flash flood and the severe cyclonic storm responsible for the heavy rain are described. Heavy rainfall started on the evening of October 23 and stopped on the morning of October 24. The flash flood thus started on the night of the 23rd and was over on the morning of October 24. The occurrence of the flash flood during the night and the strong winds due to the land depression was unfavorable for evacuation of the inhabitants of Pakokku and Monywa districts. Most of the flash floods in Burma are associated with heavy rainfall. Forecasting of flash floods depends on forecasting of heavy rainfall, which in turn depends on the movement of the storm. SOME EXAMPLES OF HEAVY RAINFALL IN JAPAN,
Japan Meteorological Agency, Tokyo.
Yonejiro Yamagishi.
In: Forecasting of Heavy Rains and Floods, Proc Joint Seminar of Regional Associations 2 and 5 of World Meteorological Organization, Nov 11-23, 1968, Kuala Lumpur, Malaysia; published by World Meteorological Organization, Geneva, p 243-252, 1970. 10 p, 3 fig.

Descriptors: *Climatology, *Monsoons, *Synoptic analysis, *Precipitation (Atmospheric), *Typhoons, Tropical cyclones, Storms, Weather forecasting, Meteorology, Atmospheric physics, Wet seasons, Weather patterns, Fronts (Atmospheric), Warning systems.
Identifiers: *Japan, *ECAFE, *Jet streams.

Japan is situated close to the east coast of the Asiatic Continent and is in one of the rainiest areas in the middle latitude. Typhoons attacking Japan from early summer to late autumn bring with them a great quantity of tropical warm moist air, and usually give rise to heavy rainfalls. In early summer, a front remains near and over Japan, while the southwesterly monsoon carries warm moist air from South China to Japan. Almost every year heavy rainfall occurs near this front, particularly in Western Japan. Some characteristic features of heavy rainfall in Japan are discussed in relation to the jet stream pattern. THE PROBLEM OF FLOOD PREDICTION ON THE EAST COAST OF WEST MALAYSIA,
Drainage and Irrigation Dept., Kuala Lumpur (Malaysia). Research Station.
Tan Hoe Tim.
In: Forecasting of Heavy Rains and Floods, Proc Joint Seminar of Regional Associations 2 and 5 of World Meteorological Organization, Nov 11-23, 1968, Kuala Lumpur, Malaysia, published by World Meteorological Organization, Geneva, p 253-258, 1970. 6 p.

Descriptors: *Climatology, *Monsoons, *Synoptic analysis, *Precipitation (Atmospheric), *Typhoons, Tropical cyclones, Storms, Weather forecasting, Meteorology, Atmospheric physics, Wet seasons, Weather patterns, Fronts (Atmospheric), Warning systems.
Identifiers: *Malaysia, *ECAFE.

The 1967 floods occurring in the Malaysian east coast States of Kelantan and Trengganu as well as in the State of Perak claimed many victims, and total losses sustained were estimated at some US $12.5 million. A brief description of the storm was given, together with an account of the existing

flood warning system. The seasonal rainfall patterns are associated with two distinct surface winds, namely the N-E and the S-W monsoons - from November to March, and May to September respectively. The most frequent type of monsoon rain is preceeded by strong easterly or northeasterly surface winds in the South China Sea. If it is reinforced by the presence of other low-level atmospheric disturbances in the form of either shallow vortices or strong horizontal winds, then heavy storms covering a large area for an appreciable duration are likely to occur. (Knapp-USGS)
W71-04167

HEAVY RAINFALL IN PAKISTAN AND ITS ASSOCIATED FLOOD,
Pakistan Meteorological Dept., Karachi. Central Secretariat.
M. S. Huq.
In: Forecasting of Heavy Rains and Floods, Proc Joint Seminar of Regional Associations 2 and 5 of World Meteorological Organization, Nov 11-23, 1968, Kuala Lumpur, Malaysia, published by World Meteorological Orgaization, Geneva, p 259-266, 1970. 8 p, 3 fig, 5 ref.

Descriptors: *Climatology, *Monsoons, *Synoptic analysis, *Precipitation (Atmospheric), *Typhoons, Tropical cyclones, Storms, Weather forecasting, Meteorology, Atmospheric physics, Wet seasons, Weather patterns, Fronts (Atmospheric), Warning systems.
Identifiers: *Pakistan, *ECAFE.

Quantitative precipitation forecasting over an area under favorable synoptic conditions is necessary for flood forecasting. Synoptic features of weather systems associated with heavy rainfall over Pakistan during strong southwest monsoon, easterly waves, pre-monsoon, monsoon and post-monsoon depression, western disturbances, and storms are described. Seasonal floods occur over East Pakistan and northern parts of West Pakistan during the southwest monsoon season, when heavy rainfall takes place for days. Flash floods over the northeastern part of West Pakistan during winter result from moderately heavy to heavy rains caused by passage of active western disturbances. Over southern parts of east Pakistan during the period May to October they result from heavy to very heavy rains caused by travel of tropical depression storms over or near the area. Tidal waves occur in East Pakistan when tropical storms cross the coast at the time of high tide. All the formulas reviewed for quantitative precipitation forecasting require use of high-speed electronic computing machines for computation of rainfall. (Knapp-USGS)
W71-04168

HEAVY RAINFALL AND ASSOCIATED FLOODS IN WEST PAKISTAN,
Regional Meteorological Center, Lahore (Pakistan).
Sufi M. Moazzam.
In: Forecasting of Heavy Rains and Floods, Proc Joint Seminar of Regional Associations 2 and 5 of World Meteorological Organization, Nov 11-23, 1968, Kuala Lumpur, Malaysia, published by World Meteorological Organization, Geneva, p 267-281, 1970. 15 p, 10 fig, 1 map.

Descriptors: *Climatology, *Monsoons, *Synoptic analysis, *Precipitation (Atmospheric), *Typhoons, Tropical cyclones, Storms, Weather forecasting, Meteorology, Atmospheric physics, Wet seasons, Weather patterns, Fronts (Atmospheric), Warning systems.
Identifiers: *Pakistan, *ECAFE.

Westerly low-pressure waves, locally known as western disturbances, cause winter rainfall over West Pakistan. Moderately heavy rainfall occurs occasionally due to active low-pressure waves. The summer monsoon is mainly responsible for rainfall over West Pakistan and over the upper catchment areas of the rivers of the Indus Basin. During the monsoon season, depressions and storms developing over the Bay of Bengal and then moving towards West Pakistan cause heavy rainfall over the upper catchment of the rivers and sometimes over the plains as well. Floods are mainly due to this heavy rainfall. Moderately heavy to heavy rainfall in winter over the Indus and Jhelum catchment areas can also cause medium or high floods. Rainfall predictions are made empirically with upper-air and normal seasonal precipitation maps. Rainfall-runoff relationships were evolved for flood forecasting purpose. (Knapp-USGS)

THE CIRCULATION PATTERN OVER SINGAPORE AND THE EAST COAST OF WEST MALAYSIA DURING JANUARY AND FEBRUARY 1967 COMPARED WITH THAT OF JANUARY AND FEBRUARY 1968,
Singapore Meteorological Service.
T. L. Gan.
In: Forecasting of Heavy Rains and Floods, Proc Joint Seminar of Regional Associations 2 and 5 of World Meteorological Organization, Nov 11-23, 1968, Kuala Lumpur, Malaysia, published by World Meteorological Organization, Geneva, p 283-289, 1970. 7 p, 3 fig, 9 ref.

Descriptors: *Climatology, *Monsoons, *Synoptic analysis, *Precipitation (Atmospheric), *Typhoons, Tropical cyclones, Storms, Weather forecasting, Meteorology, Atmospheric physics, Wet seasons, Weather patterns, Fronts (Atmospheric), Warning systems.
Identifiers: *Malaysia, *ECAFE.

In January 1967 there was catastrophic flooding on the east coast of North Malaya, and in February 1967 there was flooding in South Malaya. By contrast January and February 1968 were dry. The well-developed troughs in the sub-tropical jetstream which extended to equatorial latitudes over West Malaysia in January - February 1968, were mainly responsible for the dry weather over Singapore and the east coast of West Malaysia during this period. Heavy rainfall in January - February 1967, was associated with vortices in the inter-tropical convergence zone with a broad deep easterly current to the north. The vortex of January 5, 1967, was associated with a strong surge of the trades and a cold surge from Siberia (indicated by high and increasing pressure over China). It is likely that these two factors intensified the vortex and produced the abnormally heavy rainfall from January 5-6, 1967. (Knapp-USGS)

THE CLIMATE OF INTERIOR OMAN,
Anti-Locust Research Centre, London (England).
D. E. Pedgley.
Meteorological Magazine, Vol 99, No 1171, p 29-37, February 1970. 2 fig, 3 tab, 17 ref.

Descriptors: *Arid lands, *Monsoons, *Precipitation (Atmospheric), *Climatic data, *Winds, Seasonal, Climatology, Meteorology, Turbulence, Temperature, Humidity, Convection, Tropical regions, Tropical cyclones, Advection, Flow profiles.
Identifiers: *Oman, *Intertropical convergence zone, *Oman convergence zone.

Until recently, data on the climate of the interior of Oman and the Empty quarter of Arabia in general, have been lacking. Now, oil company exploration camps are keeping records and some data, though inadequate, is available. Records from Fahud indicate relative humidity maxima occurring January and February and a secondary maximum in August and September. Mean monthly temperature maxima show a seasonal trend, with January the coolest and June the hottest, while July to September were each cooler than expectations from trends in the other months. This is associated with monsoonal blowing from the Arabian Sea during those months. A 7-year rainfall record is adequate, but indicates an annual total of 30 mm, most of which falls from March to May with scanty falls from July to September. These records are similar to those from Midway, Dhofar and Nizwa, although Nizwa, at the eastern base of the Hajar Mountains, experiences somewhat more July to September rainfall. Over the Hajars, annual totals reach 150 mm. The southerly monsoon (July to September), peaks in July and is about 1 km deep. For the rest of the year, dry north-westerlies dominate the interior and when they meet either easterlies (November to January) or Southerlies (February to June, October), an Oman convergence zone is indicated. From July to September this zone becomes the intertropical convergence zone. (Casey-Arizona)

A NEW APPROACH TO THE CLASSIFICATION OF CLIMATE,
Middlebury Coll., Vt. Dept. of Geography.
Vincent H. Malmstrom.
Journal of Geography, Vol 68, No 6, p 351-357, September 1969. 5 fig.

Descriptors: *Climatic zones, *Classification, *Climatic data, *Water balance, *Temperature, Precipitation (Atmospheric), Evapotranspiration, Mosture deficit, Geographic regions, Mapping, Crops, Vegetation, Soil, Estimating equations, Vapor pressure, Monthly, Data collections.
Identifiers: *Potential evapotranspiration, *Climatic types, *Mosture index, *Warmth index, *Thornthwaite climatic classification.

While it represents a conceptual advance over the Koppen system, the Thornthwaite climatic classification is difficult in practice because parameter computations are tedious and their significance is obscure. Proceeding from the fact that saturation vapor pressure, a relative expression, is primarily a function of temperature, a method was devised for determining the 'water need' (N) of any given station by using only the average monthly temperature of that station. This was achieved by finding a threshold value giving a close approximation to the appropriate Thornthwaite potential evapotranspiration value and incorporation of a correction factor. The threshold value empirically decided upon was 25 mm at O deg. C. The water need for a given month may be obtained by dividing the saturation vapor pressure at the monthly temperature by the saturation vapor pressure at O deg. C., and multiplying by 25 mm. Annual water need is the sum of the monthly water needs. Annual precipitation may then be divided by annual water need to obtain a 'moisture index'. The average annual water budget of an area may by assessed by plotting both N and precipitation against time. A 'warmth index' (WI) was developed using a 6 deg. C. threshold value from growing-degree studies, discarding all months where N was less than 38 mm and subtracting 38 mm from all other months. Therefore WI—N-38 mm/100. Thus, for every station 4 parameters are obtained and it is the moisture index and WI that are employed in describing climatic differentiation. Resulting climatic maps using these indices are given and a number of valuable results are obtained and discussed. (Casey-Arizona)

SOME ASPECTS OF DROUGHT CLIMATOLOGY OF THE DRY SUBHUMID ZONES OF SOUTH INDIA,
Andhra Univ., Waltair (India). Dept. of Meteorology and Oceanography.
V. P. Subrahmanyam, and C. V. S. Sastri.
Journal of the Meteorological Society of Japan, Vol 47, No 4, p 239-244, August 1969. 6 fig, 1 tab, 5 ref.

Descriptors: *Subhumid climates, *Droughts, *Water balance, *Climatic data, Precipitation (Atmospheric), Evapotranspiration, Statistical methods, Data collections, Climatology, Arid climates, Humid climates, Variability, Hydrologic cycle, Climatic zones, Fluctuation, Moisture deficit, Semiarid climates.
Identifiers: *Aridity index, *Potential evapotranspiration, *Agroclimatology, *India, *Thornthwaite's equation.

ttempting to evaluate drought, rainfall analysis nsufficient, water budgets alone are capable of ding objective data. Using Thornthwaite's hods, the dry regions of South India were de- cated into 3 climatic types-dry subhumid, iarid and arid. Deficiencies of 50% in rainfall in nid or arid climates do not greatly affect water nce. By contrast, drought study in dry subhu- zones is especially interesting because water nces fluctuate so frequently and violently. The ity index is the ratio of annual water deficiency otal annual water need. Drought intensity is uated by the departure of aridity indices from r median. Drought indices were plotted from 4 resentative weather stations for the period 1-1965. Plots of aridity index vs. time showed g-term trends in climatic shifts toward arid or nid. Plots of actual evapotranspiration, potential poration and rainfall vs. month give accurate ure of water balance fluctuations over a given r. This data is particularly crucial for agriculture ubhumid zones. (Casey-Arizona)

ME FEATURES OF THE MECHANICS OF ACIER MOVEMENT,
A. Litosh.
nslated from Trudy TSANIGMI, No 44 (59), 9, p 89-98. Soviet Hydrology: Selected Papers, 4, p 399-405, 1969. 7 p, 1 fig, 18 ref.

scriptors: *Glaciers, *Rheology, *Movement, n-Newtonian flow, Viscosity, Plasticity, Mathe- tical studies, Data collections, Regimen, Physi- properties.
ntifiers: *Glacier movement, *USSR.

solve the plane problem of the movement of an thermal mountain glacier for a cross section med by the vertical plane crossing the line of vement near the axis of the glacier, the dchenko Glacier, USSR, was selected for study. e lines of the longitudinal profile of the glacier face are properly approximated by a straight e. An approximation by second-degree polynomials is quite acceptable for the functions of the surface ice velocity, the difference in the mass balance at the surface, and the changes in the level of the glacier surface. The problem was solved by analyzing the process of steady-state creep or non-linear viscous flow. The initial system of equations was formulated in terms of the stress components. For steady-state creep, the general differential equations in terms of stress include balance equations and continuity equations analogous to the Beltrami-Mitchell equations in elasticity theory. The continuity equations are formed by excluding the rates of deformation by means of rheological equations from the St. Venant compatibility conditions. (Knapp-USGS)

RECONSTRUCTION OF SUBGLACIAL RELIEF FROM RADIO ECHO SOUNDING RECORDS,
Scott Polar Research Inst., Cambridge (England).
C. H. Harrison.
Geophysics, Vol 35, No 6, p 1099-1115, December 1970. 7 p, 14 fig, 7 ref.

Descriptors: *Remote sensing, *Radar, *Glaciers, *Channel morphology, *Topography, Antarctic, Geomorphology, Movement, Instrumentation, Calibrations, Data collections.
Identifiers: *Subglacial relief, *Radio echo sounding.

In 1967 a party from the Scott Polar Research Institute, Cambridge, England, carried out a radio echo sounding survey of the Antarctic ice sheet. The radio echo sounding apparatus basically a pulse-modulated radar operating at 35 Mhz, was installed in a U. S. Navy Constellation aircraft. The fan-shaped beam is broadest along the line of flight, causing problems of interpretation analogous with those encountered in marine echo sounding and seismic surveying. Also, bottom echoes are affected by refraction at the ice surface. Examples of hyperbolic variations of echo delay with horizontal movement may be seen at the edges of ice shelves, crevasses, or cracks at the bottom of the ice. It is possible to distinguish specular from nonspecular reflections; the shape of the reflecting surface may be calculated. A computer program transforms the digitized film record into a real space profile. A cross-section of Nimrod Glacier and the bottom of the ice sheet near Vostok were plotted; in both cases there is a striking difference between the computed space profile and the echo profile. SNOWMELT AND WATER YIELD FROM SNOW COVER,
State Hydrological Inst., Leningrad (USSR).
P. P. Kuzmin.
In: Floods and Their Computation, Vol 2, International Association of Scientific Hydrology Publication No 85 (Unesco-WMO), p 591-598, 1969. 8 p, 1 fig, 1 tab, 2 ref.

Descriptors: *Snowmelt, *Flood forecasting, *Streamflow forecasting, Water balance, Heat budget, Water yield, Snowpacks, Snow surveys, Meteorology, Statistical methods, Frequency analysis.
Identifiers: Snowmelt forecasting.

Research methods of assessing snowmelt and water yield from snow cover to provide data for analysis of spring flood formation and runoff calculation are discussed. The main parameters of snowmelt and water yield are mean water equivalent of snow cover and its areal distribution up to the beginning of the snowmelt period, hourly and daily variations of snowmelt intensity, characteristic snowmelt dates and stages, and rate of water yield from snow cover. To determine mean water equivalent of snow cover, snow surveys based on periodical statistical sampling are performed; distribution (frequency) curves of water equivalent of snow cover are plotted. To determine snowmelt and rate of water yield, methods are based on consideration of components of the heat and water balance of the snow cover, as well as an empirical formula using standard meteorological observations from the hydrometeorological network. Water yield from snow cover is derived from the water balance equation. (Knapp-USGS)
W71-04171

A METHOD FOR THE COMPUTATION OF WATER YIELD FROM SNOW DURING SNOW-MELT PERIOD,
State Hydrological Inst., Leningrad (USSR).
A. G. Kovzel.
In: Floods and Their Computation, Vol 2, International Association of Scientific Hydrology Publication No 85 (Unesco-WMO), p 598-607, 1969. 10 p, 2 fig, 2 tab, 7 ref.

Descriptors: *Water yield, *Snowmelt, *Streamflow forecasting, Water balance, Heat budget, Snowpacks, Snow surveys, Meteorology, Statistical methods.
Identifiers: Snowmelt forecasting.

Computation of water yield from snow involves the transformation of snowmelt water and rainfall by the snow pack on the surface of the watershed for any time interval of the whole snowmelt period. The scheme is applied to detailed investigation of runoff formation by snowmelt on watersheds as modified by the influences of physiography and man's activity. Snowmelt intensity is computed by the method of heat budget of the snow pack, or by means of simpler computation schemes based on the application of standard meteorological observation data. To characterize the snow cover distribution over a watershed, the mass curve of water equivalent distribution should be used. Tables permit computation of the outflow of snowmelt water from the snow pack on the surface of the basin at

two of the most common indices of the water-holding capacity of snow. The method also provides a means of estimation of the total area of the basin free from snow for any moment during the snowmelt period without using direct measurements. (Knapp-USGS)
W71-04172

SOME PROBLEMS OF DETERMINING THE WATER EQUIVALENT OF THE SNOW COVER,
Research Inst. for Water Resources Development, Budapest (Hungary).
M. Hegedus, and K. Szesztay.
In: Floods and Their Computation, Vol 2, International Association of Scientific Hydrology Publication No 85 (Unesco-WMO), p 616-628, 1969. 13 p, 8 fig, 3 ref.

Descriptors: *Snow surveys, *Runoff forecasting, *Water equivalent, Snowpacks, Snowmelt, Streamflow forecasting, Flood forecasting, Sampling, Monitoring, Gaging stations, Water yield.
Identifiers: *Hungary.

During recent years 52 stations and 2 experimental areas have been installed in the framework of preliminary investigations for elaborating a Hungarian national program for snow measurement. The first results of these measurements are evaluated. The following problems are discussed: the conditions of equal accuracy in snow depth and water equivalent measurements; the real accuracy in determining snow density from depth and water equivalent data; factors affecting variability of simultaneous snow depth and density values along snow courses and within small areas; and theoretical bases of planning a combined application of snow depth and snow density measurements. (Knapp-USGS)

SOME RESULTS OF INVESTIGATION AND REPRESENTATION OF SNOW SUPPLY AND THE MELTING OF SNOW,
Meteorologischer Dienst der Deutschen Demokratisches Republik, Halle. Amt fuer Meteorologie.
M. Rachner.
In: Floods and Their Computation, Vol 2, International Association of Scientific Hydrology Publication No 85 (Unesco-WMO), p 628-637, 1969. 10 p, 7 fig, 11 ref.

Descriptors: *Snowmelt, *Water yield, *Snowpacks, *Meteorology, *Energy budget, Streamflow forecasting, Water supply, Ablation, Snow surveys, Water equivalent.
Identifiers: Snowmelt forecasting.

Results of experiments to investigate and represent the snow-supply and the ablation of snow cover for the Selke catchment area, German Democratic Republic are presented. Methods of surveying snow cover are outlined. The ablation of snow cover is calculated by the aid of radiation measurements and the energy budget. Special measurements (gradients of climatic elements) showed significant local differences of snow-cover ablation. The importance of the experiments with regard to water management and hydrology is discussed. (Knapp-USGS)
W71-04174

RUNOFF CONDITIONS DURING SNOW THAWING IN THE MORAVIAN-SILESIAN BESKIDS,
Research Inst. of Amelioration, Prague (Czechoslovakia).
V. Zeleny.
In: Floods and Their Computation, Vol 2, International Association of Scientific Hydrology Publication No 85 (Unesco-WMO), p 637-644, 1969. 8 p, 8 tab, 5 ref.

Descriptors: *Snowmelt, *Floods, *Water yield, Snowpacks, Flood forecasting, Streamflow forecasting, Data collections, Hydrologic data, Runoff, Runoff forecasting.
Identifiers: Czechoslovakia.

Among the causes of floods is snowmelt. Using the examples of runoff during the thawing in the experimental watersheds Mala Raztoka and Cervik in the Moravian-Silesian Beskids it is shown that in these mountain forested regions the thawing of snow is usually quite harmless because of the configuration of the landscape and of the presence of forests. In the course of 13 years there has not been a single case recorded of any flood wave with a maximum runoff above 367 liters/sec/sq km. (Knapp-USGS)
W71-04175

METHODS OF SNOWMELT MAXIMUM DISCHARGE COMPUTATION IN CASES OF ABSENCE OR INSUFFICIENCY OF HYDROMETRIC DATA,
State Hydrological Inst., Leningrad (USSR).
A. A. Sokolov.
In: Floods and Their Computation, Vol 2, International Association of Scientific Hydrology Publication No 85 (Unesco-WMO), p 671-680, 1969. 10 p, 2 fig, 2 tab, 12 ref.

Descriptors: *Runoff forecasting, *Streamflow forecasting, *Snowmelt, *Flood forecasting, *Gaging stations, Statistical methods, Peak discharge, Topography, Climatology, Meteorology, Vegetation effects, Frequency analysis, Synoptic analysis.
Identifiers: USSR.

Investigations were performed to verify existing computation formulas on the basis of long period observations of 2300 stations in the USSR and to establish the most reasonable estimation scheme of snow melt maximum discharges in cases of absence or insufficiency of hydrometric data. The proposed estimation scheme is based on the depth of spring flood runoff and the reduction of the coefficient of runoff intensity (ratio of maximum specific discharge to the total depth of spring flood runoff) depending on catchment area. The principal parameters of the scheme are the coefficient of runoff intensity and the reduction parameter; they are assumed to be variables and are determined on empirical data for each natural zone. Rivers of mountain regions are considered separately. The estimation scheme takes into account individual basin features affecting snowmelt maximum runoff such as: lake percentage and distribution over the basin; swamp percentage and swamp characteristics; forest percentage and relief and soil characteristics of the basin. ESTIMATION OF THE WATER SUPPLY FROM SNOW COVER IN THE SOUTHERN PART OF THE GERMAN D. R. IN SPRING 1965,
Meteorologischer Dienst der Deutschen Demokratischen Republik, Berlin. Forschungsinstitut fuer Hydrometeorologie.
H. Grasnick.
In: Floods and Their Computation, Vol 2, International Association of Scientific Hydrology Publication No 85 (Unesco-WMO), p 607-615, 1969. 9 p, 4 fig, 3 tab, 6 ref.

Descriptors: *Snowmelt, *Water yield, *Streamflow forecasting, *Snow surveys, Snowpack, Water supply, Flood forecasting, Statistical methods, Meteorology.
Identifiers: Snowmelt forecasting.

The extreme snow conditions in the German Democratic Republic in the beginning of March 1965 caused a problem of evaluation of the water supply to be expected from a large snow-covered area. By means of an ad hoc snow survey it was possible to appraise the situation in flood-developing territories and to plot maps (scale 1:500,000). By evaluating these maps in terms of snow depth and density, the mean areal value of water supply for several river basins was calculated. The values obtained by various methods gave good agreement. Correlations were found concerning dependence of the water supply on the altitude, but no relation between snow density and altitude. (Knapp-USGS)

SUMMARY OF SNOW RESEARCH BY THE ROCKY MOUNTAIN FOREST AND RANGE EXPERIMENT STATION AT LARAMIE, WYOMING.,
Forest Service (USDA), Laramie, Wyo. Rocky Mountain Forest and Range Experiment Station.
Ronald D. Tabler.
Proceedings of the Workshop on Snow and Ice Hydrology, Colorado State University, p 134-135, August 18-22, 1969.

Descriptors: *Research facilities, *Snow management, Sagebrush, Snowpacks, Water yield improvement, Soil-water-plant relationships, Wyoming.
Identifiers: *Snow fences, Blowing snow.

This paper summarizes research conducted by the Rocky Mountain Forest and Range Experiment Station on snow movement and the management of snow on Wyoming's windswept plains. One area of research centers on the use of snow fences to increase usable water yield or to augment moisture available for on-site use. Snow accumulation and melt are also being studied as part of a program to determine the hydrologic characteristics of sagebrush (Artemisia L.) lands and to evaluate the effects of current sagebrush control programs to improve forage values on western rangelands. LUENCE OF LOW RATES OF WATER AP- CATION BY SPRINKLERS ON THE CROCLIMATE,
th Dakota State Univ., Brookings. Dept. of icultural Engineering.
n L. Wiersma.
ilable from NTIS as PB-197 112, $3.00 in er copy, $0.95 in microfiche. South Dakota e University Water Resources Center Project npletion Report for July 1965-June 1968. ember 1970. 84 p, 12 fig, 27 ref. OWRR Pro- No. A-006-S Dak (1).

criptors: *Sprinkler irrigation, *Irrigation effi- cy, *Evapotranspiration, *Water loss, *Crop onse, Irrigation design, Irrigation operation maintenance, Irrigation practices, Soil-water- t relationships, Microclimatology.
ntifiers: *Low-rate sprinkler irrigation.

analysis was made of water losses due to poration within the wetted area of a low appli- on rate sprinkler system operating during light hours under conditions of slight to derate breezes. The magnitude of evaporation from the sprinkled area was determined by asuring the absolute humidity, temperature, and d speed profiles immediately upwind and nwind from a large bromus grass field where r-horizontal homogeneity existed prior to ration of the sprinkler. Sprinkler discharge rate operating pressure had minimal effect on water . The losses were mainly evaporation from plant faces, and were as high as one-half of the sprin- water discharge. The greatest decrease in potranspiration was adjacent to the wetted area. eld 70 meters downwind from the sprinkler line unaffected. Approximately one-eighth of the er that evaporated within the sprinkled area was et by a decrease in evapotranspiration in the 70 meters downwind. The rate of water appli- on had minor effects on the water application ciency. Irrigation design efficiency should not substantially affected if application rates are uced for cost efficiency. ROMETEOROLOGY SURVEY OF THE GHLANDS OF EASTERN AFRICA,
H. Brown, and J. Cocheme.
ture and Resources, Vol 6, No 3, p 2-10, Sep- ber 1970. 5 fig, 2 tab.

scriptors: *Evapotranspiration, *Crops, *Cli- tic data, *Rainfall, *Regional analysis, Grasses, mperature, Ecosystems, Fungi, On-site in- tigations, Crop response, Water balance, En- onmental effects, Semiarid climates, Tropical re- ns, Data collections, Soil properties, Agricul- e, Seasonal, Plant growth, Monthly, Water uirements.
ntifiers: *East Africa, *Agroclimatology, otential evapotranspiration, *Penman's formula, ffee, Tef, Pyrethrum, Tea.

eastern Africa highland region including parts Kenya, Uganda, Tanzania, and Ethiopia was sur- veyed for climatic factors influencing crop production. The climatic needs and tolerances of various regional crops were also determined and the 2 sets of data were compared so that agriculture in the area would achieve maximum crop production efficiency. Meteorological data from 35 stations were used for calculation of potential evapotranspiration according to Penman's formula. Circular monthly maps of rainfall and potential evapotranspiration were constructed for various areas and the water requirements of given crops could be superimposed upon the maps to determine how closely they matched the water balance of the area. Four crops- -Coffee (ccoffea arabica), tef (Eragrostis tef), pyrethrum (Chrysanthemum cinerareifolium) and tea (Camellia sinensis) -- are reviewed with respect to growth requirements, tolerances and optimal cultivation conditions. (Casey-Arizona)

POTENTIAL EVAPOTRANSPIRATION AND THE WATER BALANCE IN WEST AFRICA; AN ALTERNATIVE METHOD OF PENMAN,
California Univ., Los Angeles. Dept. of Geography.
Oyediran Ojo.
Archiv fur Meteorologie, Geophysik und Bioklimatologie, Series B, Vol 17, No 2-3, p 239-260, 1969. 10 fig, 28 ref.

Descriptors: *Evapotranspiration, *Water balance, *Vegetation, *Regional analysis, *Climatic data, Precipitation (Atmospheric), Deserts, Arid lands, Temperature, Humidity, Seasonal, Turbulence, Advection, Convection, Grasslands, Evaporation pans, Energy budget, Heat balance, Biogeography, Winds, Solar radiation, Weather patterns, Theoretical analysis, Estimating equations, Statistical methods, Gradation, Climatic zones, Rainfall, Air masses, Field capacity, Soil moisture, Soil types, Plant groupings, Forests, Stations, Maps, Measurement, Data collections.
Identifiers: *Potential evapotranspiration, *West Africa, *Psychrometers, *Bowen ratio, *Aerodynamic components, Inter-tropical convergence zone, Net radiation, Formulae.

A number of methods of calculating potential evapotranspiration (PE) are reviewed with respect to their applicability to West African climates. Since gradient measurements are difficult and complicated by advection in arid areas, Penman's formula, utilizing an aerodynamic component and an energy component, is preferable. The net radiation term is more important than the aerodynamic term and will therefore be the major source of error in calculated evaporation values. This term was modified using ordinary meteorological parameters. Linear relationships were found between measured values of evaporation using a Piche evaporimeter and calculated values from the original and modified formulae and the aerodynamic term. PE isolines were mapped for West Africa in different seasons. Water balance is the difference between precipitation (P) and PE and P-PE isolines were plotted for different months. Annual water balances were then compared with 10 vegetation zones. The forest-samanna boundary is delimited by P-PE-O and the savanna-desert boundary by P-PE- -3000 mm. Interpretations are sometimes difficult because of modification or degradation of vegetation zones. The data seem to justify use of this empirical formula for agricultural planning, but justification for many of the assumptions awaits the introduction of more sophisticated measuring devices. PROBLEMS OF DETERMINING EVAPOTRANSPIRATION IN THE SEMI-ARID TROPICS ILLUSTRATED WITH REFERENCE TO THE SUDAN,
J. Oliver.
Journal of Tropical Geography, Vol 20, No 1, p 64-74, June 1969. 4 fig, 3 tab, 31 ref.

Descriptors: *Evapotranspiration, *Rainfall, *Vegetation, *Semiarid climates, *Water balance, Climatic data, Climatic zones, Vegetation effects, Soil texture, Soil structure, Runoff, Infiltration, Distribution patterns, Diurnal, Ecosystems, Slopes, Arid lands, Tripical regions, Advection, Irrigation effects, Xerophytes, Water vapor, Maps, Sands, Clays, Temperature, Soil temperature, Solar radiation, Energy budget, Topography, Permeability, Rainfall disposition, Evaporation, Winds, Environmental effects, Mode of action, Data analysis, Frequency, Variability.
Identifiers: *Potential evapotranspiration, *Sudan, *Thornthwaite method, *Penman method, *Oasis effect, Plant cover.

In low latitude semiarid areas there is a high level of energy supply so that potential water losses by evaporation and transpiration are large. The 2 main moisture regions of the Sudan are arid and semiarid and a potential evapotranspiration map, a rainfall map and a water deficit map of the country are included. However, in an area with such climatic characteristics, actual evapotranspiration may be considerably different from potential evapotranspiration. Factors responsible for this involve sparse or patchy plant cover resulting in accentuation of the advective 'oasis effect', macro- and microreflief which affect runoff/infiltration ratios, and soil structure and texture which determine infiltration, which in turn affects both runoff and water volume in soil surface layers available for evaporation. Data are given on solar radiation which is a guide to the maximum rate at which rainfall should be lost at the surface. The temporal pattern and extent of rainfall is discussed relative to infiltration and evaporative parameters. In the Sudan there are 2 situations in which actual evapotranspiration will depart from potential evapotranspiration. In unirrigated sparsely vegetated areas, actual losses will be higher than estimates, and in irrigated areas they will be lower than estimates. (Casey-Arizona)

SOIL MOISTURE DEPLETION AND ESTIMATED EVAPOTRANSPIRATION ON UTAH MOUNTAIN WATERSHED,
Forest Service (USDA), Ogden, Utah. Intermountain Forest and Range Experiment Station.
Robert S. Johnston, Ronald K. Tew, and Robert D. Doty.
USDA, Forest Serv Res Paper INT-67, 1969. 13 p, 2 fig, 2 tab.

Descriptors: *Water yield improvement, *Evapotranspiration, *Water loss, *Evapotranspiration control, *Soil water, Soil moisture, Nuclear moisture meters, Soil moisture meters, Oak trees, Forest management, Watershed management, Land management, Water conservation, Vegetation effects, Utah, Mountain forests.
Identifiers: Experimental watersheds, Aspen trees.

Soil moisture depletion was measured with a neutron moisture probe on 14 sites representing 10 vegetation types on mountain watersheds in Utah. A water balance equation was used to estimate evapotranspiration (ET). Both soil moisture depletion and ET varied considerably between sites and from year to year. Aspen (Populus tremuloides) sprouts utilized from 0.48 to 4.50 in. less water from 6 ft. of soil than mature aspen; Gambel oak (Quercus gambelii) sprouts utilized from 0.25 to 1.15 in. less water than mature oak. By converting aspen to grass, ET losses were reduced from 1.08 to 5.18 in. from the surface 6 ft. of soil and up to 7.59 in. from a 9-ft. soil depth. (Knapp-USGS)

THE INFLUENCE OF LANDFORM AND PRECIPITATION PARAMETERS ON FLOOD HYDROGRAPHS,
Indiana Univ., Bloomington. Dept. of Geography; and Oregon State Univ., Cornwallis. Dept. of Civil Engineering.
Michael C. Roberts, and Peter C. Klingeman.
Journal of Hydrology, Vol 11, No 4, p 393-411, November 1970. 19 p, 11 fig, 2 tab, 15 ref. OWRR Project A-001-ORE (7).

Descriptors: *Hydrograph analysis, *Hydraulic models, *Rainfall-runoff relationships, Antecedent precipitation, Depth-area-duration analysis, Duration curves, Permeability, Overland flow, Hydraulic similitude, Rainfall intensity, Hydrographs.
Identifiers: *Watershed models.

A laboratory model watershed was used to determine important factors that affect stream hydrographs. The factors selected for experimental variation are rainfall intensity, rainfall duration, storm movement, permeability, and antecedent moisture conditions. Systematic changes in the flood hydrographs, caused by controlled variation of these factors, are described. Given 100% basin cover and wet antecedent conditions, the intensity of rainfall causes a marked difference in the magnitude of the discharge hydrograph. The direction of storm travel over a drainage basin may aggravate or reduce flood peaks. In regions subject to recurrent directions of major storms, the predominant direction of storm movement can give definition to a 'characteristic' hydrograph shape. Variations in this shape may result from differences in the rate of storm movement. With increasing permeability, time to equilibrium also increases. Antecedent moisture conditions are very important in determining flood magnitude. The pre-storm moisture level is responsible for wide variations in peak discharge values resulting from similar storm events. (Knapp-USGS)

FLOOD PROFILE STUDY, HOOSIER CREEK, LINN COUNTY, IOWA,
Geological Survey, Iowa City, Iowa.
Harlan H. Schwob.
Geological Survey Open-file report, October 1970. 18 p, 8 plate, 2 ref.

Descriptors: *Floods, *Profiles, *Iowa, Urbanization, Water levels, Data collections, Mapping, Maps, Surveys, Flood damage, Flood plains, Planning, Water management (Applied).
Identifiers: *Hoosier Creek (Iowa), *Linn County (Iowa), *Cedar Rapids (Iowa).

A flood-profile study was made for Hoosier Creek and its tributary South Hoosier Creek, Linn County, Iowa. The reaches studied extend from near the south Linn County line upstream to U.S. Highway 218 on Hoosier Creek, and from the mouth to U.S. Highway 218 on South Hoosier Creek. A total of about 11 miles of stream is included in the two reaches. The profiles shown in the report are computed for a very large flood under existing valley conditions and for a smaller flood under two assumed conditions of encroachment. This information can be used to supplement the existing county zoning ordinances for flood plains and to aid in future flood-plain management when part or all of the area, adjacent to the south limit of the city of Cedar Rapids, is urbanized. HYDRAULIC RESISTANCE AND FORMULA FOR COMPUTING THE AVERAGE FLOW VELOCITY OF MOUNTAIN RIVERS,
V. V. Golubtsov.
Translated from Trudy KazNIGMI, No 33, p 30-41, 1969. Soviet Hydrology: Selected Papers, No 5, p 500-511, 1969. 12 p, 3 fig, 1 tab, 26 ref, append.

Descriptors: *Open channel flow, *Hydraulics, *Stage-discharge relations, Chezy equation, Mannings equation, Roughness (Hydraulic), Depth, Slopes, Equations, Turbulent flow, Turbulence, Hydraulic gradient.
Identifiers: *USSR, *Mountain stream hydraulics.

The resistance to flow in mountain rivers generally increases as a result of the effect of hydrodynamic parameters (slope, in particular) on the conditions of flow, rather than as a result of increasing channel roughness. Only the physical conditions of flow in rivers with slopes less than 0.001 correspond to the square law of resistance. Pressure losses through resistance to flow in rivers with slopes less than 0.004 are proportional to average velocity in the sixth power. A gradual transition from the square law of resistance to resistances proportional to the average flow velocity in the sixth power is observed in the range of slopes 0.001 to 0.004. These results substantiate the conclusion derived from laboratory experiments that there is a resistance zone where velocity continues to affect resistance through the Froude number for increasing values of the Reynolds number. To compute the average velocity of mountain rivers of slope greater than 0.001 an empirically derived exponential equation relates velocity to slope, flow depth, and hydraulic roughness. (Knapp-USGS)

INFLUENCE OF THE BANKS AND FLOOD PLAIN ON CHANNEL CONVEYANCE,
I. F. Karasev.
Translated from Trudy Gos Gidrol Inst-ta, No 172, p 3-21, 1969. Soviet Hydrology: Selected Papers, No 5, p 429-442, 1969. 14 p, 6 fig, 2 tab, 15 ref.

Descriptors: *Floods, *Flood plains, *Channel morphology, *Chezy equation, *Open channel flow, Hydraulics, Discharge (Water), Mannings equation, Roughness (Hydraulic), Hydraulic radius.
Identifiers: *USSR.

The momentum equation, which allows for mass exchange at the lateral boundaries, permits an overall estimate of the influence of the banks and flood plain on flood conveyance. The working relationships include a limited number of empirical parameters: one for a channel without a flood plain and two for the flood-plain channel. The dynamic scheme, which allows for the mechanism of lateral mass exchange, has significant advantages over the correlative-statistical relationships, which give less accurate results. (Knapp-USGS)

WATER DISCHARGE TRAVEL TIME COEFFICIENTS,
V. I. Moklyak, and L. V. Shcherbak.
Translated from Trudy UkrNIGMI, No 85, 1969, p 11-15. Soviet Hydrology: Selected Papers, No 4, p 370-375, 1969. 6 p, 1 fig, 12 ref.

Descriptors: *Stage-discharge relations, *Flood forecasting, *Velocity, Discharge (Water), Discharge coefficients, River forecasting, Streamflow forecasting.
Identifiers: USSR, *Travel time (Streamflow).

Methods of computing unsteady flow of streams during floods are briefly reviewed. New methods proposed in the USSR use travel time as the main parameter, but in real streams with variable cross-sectional areas, this is too difficult to compute. Formulas are given for use in estimating travel time coefficients using discharge, stage, and the average dimensions of the stream channel in question. (Knapp-USGS)
W71-03973

COMPUTATION OF FLOW IN GLACIER-FED RIVERS,
B. A. Kamalov.
Translated from Trudy TSANIGMI, No 44 (59), 1969, p 66-80. Soviet Hydrology: Selected Papers, No 4, p 388-398, 1969. 11 p, 3 fig, 2 tab, 15 ref.

Descriptors: *Streamflow forecasting, *Glaciers, *Regimen, *Melt water, *Melting, Climates, Altitude, Heat budget, Rainfall-runoff relationships, Runoff, Snowmelt, Water sources.
Identifiers: *USSR, *Glacial runoff.

Methods of analysis of flow in the mountains involve difficulties because of the few meteorological stations, especially in the high mountains, and meteorological factors vary greatly over the territory. For this reason, a system of methods of hydrologic computations for mountain areas was developed in the USSR from long-period investigations. These methods are based on the vertical zonality of natural processes in general and hydrometeorological processes in particular. In some rivers glaciers contribute a large portion of the annual flow. For example, the melting of glaciers accounts for 32% of the annual flow of the Sokh River, 35% of the Zarafshan River, 25% of the Aksu River, and 20% of the Isfayram River. There is a close local ralationship between the runoff rate of glacier-fed rivers and the ratio of average catchment elevation to the average height of the firn line. This relationship is described statistically. There is no common relationship between the runoff rate and the ratio of catchment elevation to the average height of the firn line for large regions. The reason for this is that glaciers of widely separate regions have different thermal and mass balances. (Knapp-USGS)

HARACTERISTICS OF THE CONSTRUCTION F EQUALLY PROBABLE FLASH FLOOD YDROGRAPHS,
F. Vishnevskiy, and G. M. Shcherbak.
anslated from Trudy UkrNIGMI, No 85, 1969, p -91. Soviet Hydrology: Selected Papers, No 4, p 5-381, 1969. 7 p, 3 fig, 3 tab, 5 ref.

escriptors: *Flash floods, *Hydrographs, *Flood recasting, *Probability, Hydrograph analysis, me series analysis, Statistical methods, River recasting, Runoff forecasting, Rainfall-runoff ationships.
entifiers: *Probability hydrographs.

oper and economical planning of spillway instal- ions and bridges requires hydrographs of flows of rying probability. These hydrographs also serve the basis of water management computations for h-water and flood flow regulation. To construct equally probable rain flood hydrograph, the ly rain water inflow depths of different proba- ity of excess are obtained after statistical analysis the series of computed inflow depths. The dif- ence between the maximum discharges of the sign hydrographs for the given probability of ex- s is about 24%, which is substantial. To estimate reliability of the computed equally probable sh flood hydrographs, these hydrographs were mpared with observed hydrographs. The com- rison was made between the computed equally obable hydrographs of a probability of excess p 2.0% and p — 3.0% and observed maximum sh flood hydrographs in 1897 and 1933, whose pirical probability approximately corresponds to computed probability. This comparison showed od agreement. (Knapp-USGS)

TERMINATION OF THE DISTRIBUTION OF INFALL FLOODS IN LARGE CATCHMENTS ING HYDROMETEOROLOGICAL DATA,
eteorological Office, New Delhi (India).
Banerji, and D. C. Mantan.
Floods and Their Computation, Vol 1, Interna- nal Association of Scientific Hydrology Publica- n No 84 (Unesco-WMO), p 442-450, 1969. 9 p, g, 5 tab, 5 ref.

escriptors: *Rainfall-runoff relationships, *Flood recasting, *Peak discharge, *Low flow, Infiltra- n, Water storage, Hydrologic data, Routing, ater yield, Streamflow forecasting, Antecedent ecipitation, Depth-area-duration analysis, drograph analysis, Base flow.
entifiers: India, Streamflow estimating.

ck of hydrological data is an impediment for sign purposes of dams and reservoirs in most of catchments in the developing countries. Some ve fortunately a long period of hydrometeorolog- l data for these catchments. A method has been olved by which the daily flood formation at the int of discharge due to rain storms affecting dif- ent zones of the catchment is determined. An uation, in which the storage factor is directly re- ed to the antecedent precipitation and as such es account of infiltration and retention capacity the basin, is used for the determination of the od crest. Since the contribution from different nes of the larger catchment to the flood at the int of outflow is estimated on its antecedent and ncurrent rainfall reduced by the storage factor propriate to the wetness of the catchment, this thod does away with the laborious process of od estimation by stream routing methods. The thod is not only useful in the evaluation of day to y crest forecast for a large basin influenced by even rainfall distribution, but it may also be used estimation of low flow for countries subject to oughts. (Knapp-USGS)

Identifiers: India.

It is advantageous to use a river catchment or a part of one as a unit for quick evaluation of average basin rainfall and thus base the possible discharge on the highest rainfall recorded in the area. The Gompertz equation, which is flexible to represent various types of depth area relation, may be utilized to compute average rainfall in a river catchment based on a central value. The physical method of picking up central rainfall values in case of meager rainfall reports is suggested. (Knapp-USGS)

Knowledge of the height of a floodwave is essential from the point of view of the size of the protection dikes. The duration of the flood must be taken into consideration when considering the resistance of dikes to absorption, erosion and breaking. Each of these factors can be considered as a random variable. The methods used for estimating the probability of different heights of flood are well known. Methods are described for the determination of the function of floodwave duration distribution. (Knapp-USGS)

MAXIMUM DISCHARGE OF MAJOR RIVERS IN LARGE FLOOD PLAINS IN EAST PAKISTAN,
East Pakistan Water and Power Development Authority, Dacca.
Faiz Ahmed.

In: Floods and Their Computation, Vol 1, International Association of Scientific Hydrology Publication No 84 (Unesco-WMO), p 336-349, 1969. 14 p, 7 fig, 3 tab, 5 ref.

Descriptors: *Floods, *Peak discharge, Data collections, Hydrologic data, Water supply, Sediment load, Hydrology, Streamflow, Discharge (Water), Hydrographs, Frequency analysis.
Identifiers: East Pakistan, Brahmaputra River.

Measurement of maximum discharges of the major rivers in East Pakistan is a complex problem. Results of a study carried out in 1965 are outlined. About 70% of total flow entering East Pakistan was contributed by the Brahmaputra which has a maximum weekly discharge of 29.8 million acre feet; the Ganges contributed about 28% and the remaining 2% was contributed by small streams. The maximum storage was small at the peak flood in relation to the water passing through the system. The outflow lagged (on account of storage) only slightly behind the inflow. Rainfall was an important factor and kept pace with the increase in storage up to peak value. The maximum flood of 4.5 million cfs given by Mayer's rating or 4.0 million cfs subtracting 10% as escape flow, has a mean return period of 1500 years. (Knapp-USGS)

PROBABLE FLOOD DISCHARGES OF THE PO RIVER TRIBUTARIES,
Hydrographic Office of the Po River, Parma (Italy).
U. Raffa.
In: Floods and Their Computation, Vol 1, International Association of Scientific Hydrology Publication No 84 (Unesco-WMO), p 330-336, 1969. 7 p, 3 fig, 2 tab.

Descriptors: *Flood forecasting, *Statistical methods, *Rainfall-runoff relationships, Discharge (Water), Stage-discharge relations, Frequency analysis.
Identifiers: Po River (Italy).

The procedure adopted for the elaboration of the probable statistical characteristics of the flooding of the Po River of Italy is described and the application of the Gherardelli-Marchetti formula is illustrated. The procedure yields unit flood discharge for a given probability. Tables and the graphs are designed for the rapid evaluation of the first approximation of flood discharges in a river cross-section, knowing the morphological characteristics of the drainage basin and its area. (Knapp-USGS)

DERIVATION OF A GENERAL FLOOD WAVE HYDROGRAPH FROM A CONTINUOUS WATERSHED WATER BALANCE,
Guelph Univ. (Ontario). School of Agricultural Engineering; and Ceskoslovenska Akademie Ved, Prague. Inst. of Hydrodynamics.
H. D. Ayers, and J. Balek.
In: Floods and Their Computation, Vol 1, International Association of Scientific Hydrology Publication No 84 (Unesco-WMO), p 505-510, 1969. 6 p, 6 fig, 5 ref.

Descriptors: *Water balance, *Runoff forecasting, *Mathematical models, Routing, Hydrograph analysis, Rainfall-runoff relationships, Discharge (Water), Water storage, Flood forecasting, Synthetic hydrology.
Identifiers: Flood hydrographs.

A mathematical model providing hourly water balance information for summer, winter and combined regimes was developed. The model yields hourly volumes of surface runoff in addition to much other supplementary output information. The routing section of the model produces the three components of the hydrograph. Constant and variable parameters characterizing a general watershed are discussed from the viewpoint of surface runoff development and time distribution. (Knapp-USGS)

PRACTICAL METHODS OF ESTIMATING MAXIMUM FLOODS (FRENCH),
Consejo Superior di Investigaciones Cientificas, Madrid (Spain). Instituto de Hidrologia.
R. Heras.
In: Floods and Their Computation, Vol 1, International Association of Scientific Hydrology Publication No 84 (Unesco-WMO), p 492-504, 1969. 13 p, 10 fig, 7 tab, 5 ref.

Descriptors: *Flood forecasting, *Rainfall-runoff relationships, Statistical methods, Depth-area-duration analysis, Routing, Data collections, Streamflow forecasting, Estimating, Hydrograph analysis.
Identifiers: Spain.

Because of the great irregularity of river regimes in Spain and to the total or partial absence of hydrological data, the problem of maximum river flood computation is a very complex one. From the point of view of the economy, it is important to forecast flood levels and maximum discharges. This report contains a summary of different methods (direct, empirical, statistical and hydrometric), which in general are used simultaneously to compare different results and to try to estimate the highest flood values with the maximum possible accuracy. C. D. Rostomov.
In: Floods and Their Computation, Vol 1, International Association of Scientific Hydrology Publication No 84 (Unesco-WMO), p 462-472, 1969. 11 p, 3 fig, 3 tab.

Descriptors: *Storm runoff, *Maximum probable flood, *Rainfall-runoff relationships, *Depth-area-duration analysis, Routing, Time of concentration, Duration curves, Mass curves, Hydrographs, Analytical Techniques.
Identifiers: USSR.

Maximum regional discharge is examined as a function of morphometric data, vegetal cover and climatic (storm) conditions. The solution is based on the principle of equality of the time of concentration and of the storm duration, which is composed of the time of travel along the slopes and along the river channel. The flow of water along the slopes is considered as steady flow; its analysis is based on the water balance equation of an elementary plot. For generalization and averaging of phenomena during runoff formation the concept of 'adjusted' length of the watercourse is used. This facilitates solution of the design storm duration, which is the principal element of storm runoff computation. For a more accurate account of runoff factors, some features of irregularity of storm intensity, storm areal distribution, and of the shape of the catchment area have been introduced in design formulas. BEDLOAD FORMULAS. PART A. A SELECTION OF BEDLOAD FORMULAS. PART B. PROGRAM LISTINGS FOR BEDLOAD FORMULAS,
Pennsylvania State Univ., University Park. Dept. of Civil Engineering.
Sam Shulits, and Ralph D. Hill, Jr.
Available from NTIS as PB-194 950, $3.00 in paper copy, $0.95 in microfiche. Hydraulics Laboratory Bulletin, ARS-SWC-1, Dec 1968. 218 p, 89 ref. Dept of Agriculture Contract 12-14-1000-8872 (41).
Identifiers: *Bed load, Mathematical models, *Channels, Waterways, Sediment transport, Channel flow, Erosion, FORTRAN, Computer programs.

Formulas for computing bedload are reviewed, and FORTRAN program listings are given for digital computer solution of 14 of them. The programs are for the formulas of Schoklitsch, Meyer-Peter, Casey, Haywood, Straub, Waterways Experiment Station, Shields, Kalinske, Meyer-Peter and Muller, Eizerman and Frijlink, Laursen, Rottner, and Einstein. Results of the formulas are compared by calculating and plotting sediment discharge against water discharge for all of them. Each formula is presented in its original form and units, and its use is explained as the originator intended. It is concluded that 3 of the formulas give the best results, with adequate agreement with data. The Schoklitsch (1934) formula is selected as the best relation of bedload to discharge. The Straub and they Meyer-Peter and Muller formulas are selected as the best relations of bedload to tractive force. The 3 formulas are valid for effective particle diameters from 0.3 to 7 mm. The Schoklitsch (1934) formula is proposed as the best of the 3 because of its simple form and because it produces directly a bedload-discharge rating curve.

SUPERPOSITION OF SUBMONTHLY FLOWS IN STOCHASTIC HYDROLOGY,
North Carolina Univ., Chapel Hill.
David H. Moreau.
Presented at 17th ASCE Hydraulics Division Conference, Logan, Utah, Aug 20-22, 1969. 14 p, 2 fig, 2 tab, 7 ref, append. OWRR Project A-043-NC (1).

Descriptors: *Stochastic processes, *Hydrology, *Streamflow, *Monthly, Time, Monte Carlo method, North Carolina.
Identifiers: Maxima, Minima, Haw River.

The object of this paper was to report on progress of current research to divise a technique for superimposing variability of stream flows having a duration of less than a month onto monthly flow sequences, whenever the probability of an extreme event occurring within the month was sufficiently large. There were two analyses of interest; first, an examination of relationships between maxima and minima of stream flows averaged over some submonthly time period to flows averaged over a month; and second, a technique for superimposing sub-monthly flows on monthly flows. Reported were results of: (a) a Monte Carlo technique for finding distributions of peak-to-mean and minima-to-mean ratios of weekly flows on monthly values, and (b) a technique for generating sub-monthly flows such that the first three moments and correlations among deviations of sub-monthly flows from

nthly flows were preserved. Analyses were ed on 34 years of recorded observations on the v River at Pittsboro, North Carolina near the struction site for New Hope Dam. (Kriss-Cor-)

LOWER AND MIDDLE IRRAWADDY FLOODS IN RELATION TO HEAVY RAINFALL IN THE HEAD WATER REGIONS OF CHINDWIN AND IRRAWADDY RIVERS,
Burma Meteorological Dept., Rangoon.
Ba Kyi.
In: Forecasting of Heavy Rains and Floods, Proc Joint Seminar of Regional Associations 2 and 5 of World Meteorological Organization, Nov 11-23, 1968, Kuala Lumpur, Malaysia, published by World Meteorological Organization, Geneva, p 221-242, 1970. 22 p, 16 fig, 1 tab, 4 ref.

Descriptors: *Floods, *Rainfall-runoff relationships, *Flood forecasting, *Monsoons, *Tropical cyclones, Synoptic analysis, Rainfall intensity, Storms, Weather forecasting, Climatology, Meteorology.
Identifiers: *ECAFE, *Burma.

Studies of 15 floods in the middle and lower Irrawaddy River, Burma indicated that all widespread floods were associated with rainstorms in the monsoon trough of at least 3 days duration. Because the northern part of the country is a mountainous region it appears that the active monsoon trough effect was added by the orographic effect, thereby producing intense rainstorms favoring formation of floods in the middle and lower Irrawaddy catchments. For major floods the lag time between the end of significant rain in the head-water regions and the time of occurrence of peak at Henzada was about 15 days. Forecasting of floods along middle and lower Irrawaddy by using known meteorological conditions in the head-water regions of Chindwin and Upper Irrawaddy appears to have advantages over any of the existing methods because preliminary warning can be issued well in advance. Identifiers: Volga River System (USSR).

For lack of hydrological and morphometric information it is difficult to use hydrodynamical methods of unsteady flow calculation in developing practical methods of routing flood waves on large river systems. At the same time this information is sufficient for the application of engineering methods making it possible to demonstrate the general scheme of flood wave movement along the river system without detailing complicated processes occurring on some river stretches. Such methods include those which are based on the use of Duhamel's integral and on the relation of discharges and volumes. Parameters needed for the use of these methods can be determined by means of observations of the hydrological regime. When using engineering methods of routing of unsteady flow it is convenient to select empirical parameters with the help of electronic analog computers. These methods were used in developing the scheme of flood wave computation and forecast for the complex river system of Volga--Kama--Vyatka which has more than twenty inlet gaging sections. This system has been programmed for electronic computer and is used for daily issues of short-term forecasts during the period of floods. A timely

forecast is ensured by the natural time of travel from the inlet gaging sections of the system to the outlet. (Knapp-USGS)

J. A. Zhelesniak, and L. B. Byshovets.
In: Floods and Their Computation, Vol 2, International Association of Scientific Hydrology Publication No 85 (Unesco-WMO), p 681-688, 1969. 8 p, 3 fig, 1 tab, 2 ref.

Descriptors: *Flood forecasting, *Snowmelt, *Routing, Runoff forecasting, Streamflow forecasting, Frequency analysis, Hydrographs, Hydrograph analysis, Water yield, Peak discharge.
Identifiers: Isochrone method, USSR, Ukraine.

Flood forecasting by the genetic formula of runoff used in the USSR is preceded by the determination of water yield variation, distribution of areas between isochrones, and channel capacity. Water yield variation is determined by the runoff hydrograph of a small river by means of runoff retransformation within interisochrone areas. The distribution of areas between isochrones is found by using data on the length and area of catchments for the first order tributaries upstream of the given outlet, and lag time from the head to this outlet. The lag time is estimated by channel capacity, which can be determined by topographic measurements or by standard graphs depending on river length and discharge in the design outlet. Such graphs were constructed for different types of small rivers of the Ukraine. The suggested calculation method allows determination of the ordinates of a hydrograph of very rare frequency. Identifiers: Japan.

The Public Works Research Institute of Japan carried out research on forecasting of snowmelt floods from 1956 to 1965 at Yuzawa, Niigata Prefecture, in the temperate zone. The study watershed's catchment area is 147 sq km. The water equivalent, depth of snow, and the amount of snowmelt were measured by means of gamma-ray moisture meters. Estimating the total amount of snow on the basin at the end of winter, the mechanism of latent heat transferred into the snow layer, and the path of snowmelt water into small brooks are studied in detail in a smaller research watershed of 8.35 sq km. EFFECT OF DISPERSION, GRAVITATIONAL SEGREGATION, AND FORMATION STRATIFICATION ON THE RECOVERY OF FRESHWATER STORED IN SALINE AQUIFERS,
Louisiana State Univ., Baton Rouge.
Anil Kumar, and Oscar K. Kimbler.
Water Resources Research, Vol 6, No 6, p 1689-1700, December 1970. 12 p, 9 fig, 3 tab, 11 ref. OWRR Project A-002-LA (6).

Descriptors: Water storage, *Underground storage, *Saline water systems, *Mixing, *Density stratification, Injection, Injection wells, Withdrawal, Groundwater movement, Diffusion, Dispersion, Flow, Stratified flow, Model studies, Hydraulic models, Aquifers, Artificial recharge.
Identifiers: *Underground water storage.

A CALCULATION PROCEDURE HAS BEEN DEVISED, USING EXISTING ANALYTICAL AND EMPIRICAL RELATIONSHIPS, TO PREDICT MIXING AND GRAVITATIONAL SEGREGATION IN A HORIZONTAL RADIAL FLOW SYSTEM. The procedure yields results that show excellent agreement with experimental results obtained with a three-dimensional laboratory flow model in which both mixing and gravitational segregation occur simultaneously. Thus validated, the calcuation procedure was applied to the prediction of the efficiency with which freshwater stored in saline aquifers might be recovered for later use. Low aquifer water salinity, low formation permeability, and low formation thickness lead to the most favorable recoveries. The calculation procedure indicates that recovery efficiency improves with the number of injection-production cycles, thus suggesting that even for unfavorable conditions the process might become feasible on a long-term basis. Graphical presentations show the relative importance of several pertinent variables including formation stratification. (Knapp-USGS)

Available from NTIS as PB-197 117, $3.00 in paper copy, $0.95 in microfiche. Project Completion Report (1970). 15 p, 2 tab, 4 fig, 3 ref. OWRR Project A-011-NEB (1).

Descriptors: *Aquifer, *Groundwater, *Infiltration, Recharge, River quality, Water supply, Nebraska, *Artificial recharge.
Identifiers: Platte River.

The project objective was to determine the feasibility of recharging the Platte Valley Aquifer using river water infiltrated through basins. The operating problems were found to be formidable. Phase I of the study was a water quality survey of the Platte and Elkhorn Rivers. The river discharges were lower than normal and no floods occurred during the periods of sampling. Phase II consisted of an evaluation of the aquifer and preliminary recharge tests. The average transmissibility of the aquifer was 190,000 gpd/ft and the storage coefficient was 0.17. Since the water table was only 10 to 12 feet below the surface, pumping was required to lower the water level to provide storage for the recharge water. Phase III was the operation of the recharge facilities. After completion of the system in August, 1968, there was no water at the intake because of the low river stage.

AVAILABILITY OF GROUNDWATER I WESTERN COWLITZ COUNTY, WASHINGTON,
Geological Survey, Tacoma, Wash.
D. A. Myers.
Report available from Wash State Dept of Ecology Airdustrial Park, Olympia, Wash - Price $2.00 Washington Department of Ecology Water-Suppl Bulletin No 35, 1970. 63 p, 7 fig, 2 plate, 7 tab, 1 ref.

Descriptors: *Water resources, *Groundwater *Washington, *Water wells, *Hydrologic data Data collections, Aquifers, Water quality, Chemical analysis, Water levels, Water table, Water leve fluctuations, Water yield, Drawdown, Pumping Withdrawal, Streamflow, Discharge measurement Flow rates, Hydrographs, Specific capacity Logging (Recording), Surface-groundwater relationships.
Identifiers: *Groundwater resources, *Cowlitz County (Washington).

Wells in Cowlitz County, Washington, produce water from Tertiary sedimentary and igneous rock and Holocene alluvial materials. The wells range in depth from less than 6 to more than 600 feet, and yields from these wells range from less than 1 to more than 3,000 gpm. A wide variation in yields from alluvial aquifers is due primarily to the percentage of clay and silt they contain. Wells near the Columbia River tap the most productive of alluvial aquifers. Water levels in these wells show a response to river stage that is almost immediate and of the same general magnitude as the range in tidal stage of the river. Groundwater use in some parts of Cowlitz County is limited by the quality of the water. Observed dissolved-iron concentrations range from zero to 36.0 mg/l, and undesirable concentrations are common in the densely populated areas. In most other respects, the chemical quality of the groundwater is generally good. (Woodard-USGS)

GROUNDWATER RESOURCES OF COLLINGSWORTH COUNTY, TEXAS,
Geological Survey, Austin, Tex.
James T. Smith.
Texas Water Development Board Report 119, July 1970. 115 p, 10 fig, 8 tab, 22 ref.

Descriptors: *Groundwater, *Water wells, *Hydrologic data, *Data collections, *Texas, Water levels, Water quality, Water yield, Aquifer characteristics, Springs, Water utilization, Water consumption (Excludes consumptive use), Municipal water, Irrigation water, Industrial water, Stock water, Domestic water, Water sources, Chemical analysis, Pumping, Drawdown, Logging (Recording).
Identifiers: Collingsworth County, Tex.

An inventory of approximately 1,100 water wells and springs in Collingsworth County, Texas includes all public supply, irrigation, and industrial wells, and a representative number of domestic and livestock wells. The principal aquifers are the Blaine Formation of Permian age and the alluvial plain, terrace, and channel deposits of Quaternary age. The Blaine Formation yields small to large quantities of saline water (494 to 4,482 milligrams per liter of dissolved solids) to wells and is capable, in places where solution cavities are interconnected, of yielding more than 1,000 gallons per minute. Although the water is of poor quality, the Blaine is the major source of irrigation water in the county. The Quaternary alluvium yields small to large quantities of water that is generally low in dissolved solids, and is the major source of water for municipal supply. Water levels in the aquifers have remained generally steady since about 1938, except in a few areas of concentrated pumpage for irrigation. The major water quality problems in Collingsworth County are the concentrations of dissolved solids, sulfate, chloride, and sodium. No evidence was found of groundwater pollution from oil-field brines. (Woodard-USGS)

en County, Kansas, lies within the Osage Plains tion of the Central Lowlands physiographic vince and includes an area of about 504 square es. Rocks above the Precambrian basement e an average thickness of about 2,000 feet and all sedimentary in origin. The consolidated posits range in age from Cambrian through nsylvanian, and the unconsolidated deposits ge in age from probable Tertiary through aternary. The most important bedrock aquifers the shallow Pennsylvanian limestones and sand- nes that have been weathered along joints, frac- es, and bedding planes. Potable groundwater is ally not found in the county below the base of Kansas City Group, and in many places the ndary between fresh and saline water is much her in the stratigraphic section. Alluvial deposits ing an average thickness of about 25 feet in the osho River valley should yield 10 to 100 gallons minute of groundwater to wells. Water from the aternary deposits is of good quality but is usually y hard. Water derived from shallow bedrock ifers is generally higher in dissolved solids con- t and hardness than water from the Quaternary posits. (Woodard-USGS)

ital computer programs were written to meet undwater resources research requirements ause of prompt data storage and retrieval, ful- ment of data-user needs, mapping possibilities l adaptability. Groundwater research in the ricultural Engineering Department of the iversity of Arizona began in the early 1900's, as importance of groundwater to Arizona was ognized early. Thus, there are records for over years of field work. Basic groundwater data col- ted periodically includes water-level measure- nts, pumpage and consumptive use inventories, nestic and industrial use measurements, water quality, sampling chemistry and temperature, maintenance of drillers' well logs and specialized studies. The Santa Cruz Valley from Nogales to Picacho Peak, the Avra and Altar Valleys and Lit- tle Chino Valley are presently under study. Preparation of yearly groundwater contour and water-level change maps, which used to take several months, is now done by computer program. Data is card-punched, and programs print out ta- bles for office and inquiry use, hydrographs and crop-survey summaries. Programs make ground- water information available, with considerable error reduction, for class projects, graduate theses, consulting engineers, groundwater geologists, real estate agents, water users and government agen- cies. Some of the computer output may be used directly in publication. (Popkin-Arizona)

Analysis of drawdown data for an observation well in a semi-infinite aquifer gives a one-parameter family of straight lines, each of which, in the absence of supplementary geologic or hydrologic evidence, defines a possible boundary location. The curve to which all members of the family are tangent is an ellipse and is called to geohydrologic boundary envelope. This ellipse may be useful in considering the significance of nonresponsive ob- servation wells or in using supplementary geologic data to determine the position of a boundary. (K- napp-USGS)

FINITE AQUIFERS: CHARACTERISTIC RESPONSES AND APPLICATIONS,
C. Venetis.
Journal of Hydrology, Vol 12, No 1, p 53-62, December 1970. 10 p, 5 fig, 3 tab, 3 ref.

Descriptors: *Groundwater movement, *Water level fluctuations, *Simulation analysis, *Input- output analysis, Mathematical models, Numerical analysis, Synthetic hydrology, Water levels, Equa- tions, Flow, Porous media, Analog models, Aquifers.
Identifiers: Finite aquifers.

The response to characteristic piezometric height inputs of aquifers of finite dimensions is examined using linear differential equations of groundwater flow. In practical applications the response to characteristic inputs may be used in input-output analysis and synthesis for prediction of piezometric heights and estimation of the parameters of aquifers as well as in setting up and testing ground- water analog models. Such applications are illus- trated by a simple numerical example. (Knapp- USGS)

ANALYTICAL SOLUTION OF THE LAPLACE EQUATION IN REGIONAL GROUNDWATER FLOW FIELD,
Arya Mehr Industrial Univ., Tehran (Iran). Dept. of Mechanical Engineering.
Mohsen Shahbazi.
Text also in French. Journal of Hydraulic Research, Vol 8, No 4, p 457-476, 1970. 20 p, 17 fig, 12 ref.

Descriptors: *Groundwater movement, *Laplaces equation, Porous media, Permeability, Model stu- dies, Mapping, Hydraulic models, Least squares method, Flow nets, Aquifers, Groundwater basins.
Identifiers: Groundwater flow fields.

The Laplace equation was solved analytically for single and multi-layered systems in a regional groundwater flow field with the aid of conformal mapping and separation of variables. The results for one layered system were checked with laborato- ry experiments using the Hele-Shaw model. Also for multi-layered systems and for some single- layered ones, the results were shown to be in good agreement with another independent method of solution using the least-square method. 2G. Water in Soils

ADSORPTION OF BORON BY FERROMAGNE- SIAN MINERALS AND MAGNESIUM HYDROX- IDE,
Agricultural Research Service, Riverside, Calif. Soil and Water Conservation Research Div.
J. D. Rhoades, R. D. Ingvalson, and J. T. Hatcher.
Soil Science Society America Proceedings, Vol 34, No 6, p 938-941, November-December 1970. 4 p, 1 fig, 5 tab, 10 ref.

Descriptors: *Soil chemistry, *Boron, *Adsorp- tion, *Soils, Magnesium hydroxide, Leaching, Clays, Silts, Sands, Clay minerals, Particle size, Chemical analysis, Soil water, Profiles, Silicates, Soil properties, Test procedures, Methodology, Temperature, Mineralogy, X-Ray diffraction.
Identifiers: *Ferromagnesian minerals.

Arid-zone soils are found to have appreciable boron-sorption capacities in their silt and sand frac- tions. The site of this sorption is hypothesized to be magnesium-hydroxy clusters and coatings that exist on the weathering surfaces of ferromagnesian minerals such as olivine, enstatite, diopside, augite, tremolite, and hornblende as well as micaceous layer-silicate minerals. The boron-adsorption capacities of the nine soils used were determined by evaluating the Langmuir adsorption coefficients of the soils after their native sorbed boron had been removed by extraction with a mannitol-calcium- chloride solution and after they had been separated into particle-size fractions. Data for a representa- tive soil show that out of the soil's total boron-sorp- tion capacity of 10.8 mg/kg, 7.7 mg/kg reside in the non-clay fraction. The percentages of boron-sorp- tion capacity residing in the non-clay fractions ranged from 25 to 90. Thus, it is apparent that soils may contain minerals other than clay-sized minerals with their associated iron- and alluminum- hydroxy coatings that are capable of sorbing ap- preciable amounts of boron. PEDOGENIC DISTRIBUTION OF ZINC IN MOLLISOLS AND ASSOCIATED ENTISOLS IN NEBRASKA,
Nebraska Univ., Lincoln. Dept. of Agronomy.
Wayne N. Dankert, and James V. Drew.
Soil Science Society America Proceedings, Vol 34, No 6, p 916-919, November-December 1970. 4 p, 2 tab, 27 ref.

Descriptors: *Soil chemistry, *Clay loam, *Zinc, *Soil tests, *Nebraska, Distribution, Particle size,

Testing, Soil moisture, Test procedures, Soil profiles, Soil structure, Methodology, Spectrophotometry, Chemical analysis, Fine-textured soils, Carbonates, Organic matter, Silts, Plants, Sands, Adsorption, Loess, Mineralogy.
Identifiers: *Zinc distribution (Soils), Clay illuviation, Soil genesis.

The distribution of total Zn in a Udic Haplustoll (Moody) and a Typic Argiustoll (Holdrege) formed in Peoria loess in Nebraska is related to the accumulation of illuvial clay in these soils. In Typic Ustorthents (Crofton and Coly) formed in Peoria loess, a comparable distribution of noncarbonate clay and total Zn does not occur. Larger amounts of Zn in noncarbonate clay from the upper sola of the four profiles, than in noncarbonate clay from their C horizons, suggest that Zn is released from soil minerals and cycled by vegetation during biopedogenic weathering, then becomes associated with noncarbonate clay in the A horizons following decomposition of plant residues. In Moody and Holdrege, however, maximum amounts of Zn in the total soil occur in the B horizons of clay maxima, suggesting that Zn moves in association with clay from the A to the B horizons during the genesis of these soils. SOLUBILITY AND AVAILABILITY OF SORBED SULFATE IN HAWAIIAN SOILS,
Hawaii Univ., Honolulu. Dept. of Agronomy and Soil Science.
S. M. Hasan, R. L. Fox, and C. C. Boyd.
Soil Science Society America Proceedings, Vol 34, No 6, p 897-901, November-December 1970. 5 p, 6 fig, 5 tab, 24 ref.

Descriptors: *Soil chemistry, *Sulfates, *Sorption, *Soils, *Hawaii, Soil water, Solubility, Retention, Adsorption, Ionization, Anion exchange, Sulfur, Rain water, Plants, Fertilizers, Solubility, Chemical analysis, Rainfall, Soil properties, Mineralogy, Test procedures, Turbidity, Soil-water-plant relationships, Soil profiles, Crop response.
Identifiers: *Volcanic ash soils (Hawaii), Sulfate adsorption, Kikuyu grass.

The capacity of volcanic ash soils to adsorb sulfate is related to rainfall, a major factor in weathering. Highly weathered and leached soils developed from ash may contain 7000 micrograms per gram of sulfate as sulfur in the subsoil. This sulfate has very low water solubility. Some less weathered ash soils are almost devoid of sulfates. Desorption of sulfate decreases the solubility of adsorbed sulfate remaining. Sulfate sorption-desorption isotherms plotted against log concentration of sulfate in equilibrium solutions give approximately straight lines up to 16 to 30 ppm sulfur in solution. Indications are that 'first phase' adsorption maxima were attained at about 33 ppm sulfur in solution. Pot studies on soils which sorb much sulfate indicate that the soil solution should contain about 5 ppm sulfate for adequate nutrition of kikuyu grass. This corresponds to 60 to 80% of first phase adsorption maxima of the ash derived soils. Soils which have low capacity to adsorb sulfate need higher concentrations of sulfate in solution to compensate for low adsorption capacity. A soil which field experiments had shown to be very deficient in sulfur was only 10% sulfate saturated. (Woodard-USGS)

THE DIFFUSION OF COPPER, MANGANESE, AND ZINC AS AFFECTED BY CONCENTRATION, CLAY MINERALOGY, AND ASSOCIATED ANIONS,
Kentucky Univ., Lexington. Dept. of Agronomy.
J. H. Ellis, R. I. Barnhisel, and R. E. Phillips.
Soil Science Society America Proceedings, Vol 34, No 6, p 866-870, November-December 1970. 5 p, 5 fig, 1 tab, 13 ref.

Descriptors: *Soil chemistry, *Clay minerals, *Diffusion, *Cation adsorption, *Soil water, Diffusivity, Copper, Manganese, Illite, Kaolinite, Montmorillonite, X-ray spectroscopy, Equations, Theoretical analysis, Ionization, Ions, Adsorption, Plants, Root systems, Mineralogy.
Identifiers: Diffusion coefficients, Zinc.

The distributions of Cu, Mn, and Zn diffusing in thin oriented clay films of water-saturated montmorillonite, vermiculite, illite and kaolinite were obtained using a miniature probe attachment for an X-ray emission spectrometer. Diffusion coefficients were calculated from these experimental distributions. Only small differences in the diffusion coefficients of Cu, Mn, and Zn at comparable concentrations were found for a given clay. The range of diffusion coefficients for copper chloride was 0.17 millionths of a sq. cm. per sec. of vermiculite clay to 5.21 of kaolinite. The diffusion rates of copper, manganese, and zinc through the clay minerals were of the order from greatest to least: kaolinite, illite, montmorillonite, and vermiculite. Some estimates of the diffusion coefficients in the liquid phase and in the adsorbed phase are given. (Woodard-USGS)

INVESTIGATION OF THE WATER REGIME OF SOILS IN THE AERATION ZONE, THEIR FREEZING, WATER-PHYSICAL AND FILTRATION PROPERTIES,
A. A. Kapotov.
Translated from Trudy Gos Gidrol Inst-ta, No 176, p 70-107, 1969. Soviet Hydrology: Selected Papers, No 5, p 456-479, 1969. 24 p, 8 fig, 9 tab, 23 ref, 3 append.

Descriptors: *Soil moisture, *Freezing, *Thawing, *Soil physical properties, *Soil water movement, Filtration, Percolation, Frost, Snowpacks, Regime, Porosity, Moisture content, Water storage, Bulk density, Surveys, Data collections, Hydrologic data.
Identifiers: *USSR, *Valdai Hydrologic Laboratory (USSR).

Extensive data have been collected by the Valdai Laboratory of some water-physical properties of soils, their water regime, depth of freezing, and filtration properties for a relatively large area of the USSR. The area where the Laboratory made its investigations is a morainic landscape with hills, ridges, and waterlogged depressions. Dry valleys occupy an average of 80% of the total catchment areas. The surface of the catchments is composed of a layer of Quaternary glacial deposits 20-50 m thick. The lithological composition varies both in the horizontal and vertical directions. The soil hydrophysical data are summarized graphically and statistically. Graphs relate bulk density to moisture content, water storage distribution to depth, texture to physical property, freezing depth to snow depth, and absorption of depth. Tabular data include porosity, moisture content, water storage, freezing depths, snow cover, absorption and filtration characteristics, bulk density, and annual water storage records. (Knapp-USGS)

Identifiers: Seepage rings method, *Wetting fro Foreign, Research, USSR, Soil moisture mo ment, Golodnaia Steppe (USSR).

USSR hydraulic engineers have checked an Am ican method for determining soil permeability a seepage rates by large concentric rings and reco mended its use because of its reliability, especia in layered soils. Other advantages of this meth are that it uses Nesterov's principles for la wetted surfaces, familiar to Soviet soil specialis the test arrangement is simple to set up and me surements are made easily; and it is capable of a tomation. Disadvantages are the longer ti required for observations and the large quantity water used. Seepage measurements were co ducted on several test plots in the Golodn Steppe of Central Asia over a 3-year period. T 2.6-m-dia metal inner ring set in a 10-cm furr and the 7.8-m-dia earth outer ring faced wi polyethylene film automatically were kept fill with water to a constant depth of 30 cm. S moisture was measured by neutron meters insert into observation drill holes. Before-and-after me surements permitted fixing changes in the positi of the wetting front, and with time, computing t wetting and seepage rates horizontally and ver cally. Tests showed that wetting rate was at fi greater than seepage; but later they became a proximately equal and the curves became fl slopes, indicating a stable seepage rate.

geomorphology of certain areas of the Pre-
brian Dolomites of the Transvaal system of
h Africa suggest the operation of karst
esses. In describing the karst topography, 3
nct aspects of the landscape are considered:
origin and shape of the conical dolomite hills
d along the interfluves which seem to be a
of Kegel karst, (2) the wide, flat-floored val-
which were probably formed by lateral
ing of springs, floods or runoff and (3) the
nentary infill of the valleys which form ter-
s of highly weathered alluvial deposits and
h are considered relicts. The interfluves are
niscent of cone karst and the basins represent
rst plain with insoluble floors, some fault con-
and a deep alluvial infill. Degraded slopes, col-
ed caves and rotten infill combine with the
r evidence to suggest that past processes
ted the land forms which may be described as
t karst. Probably active karstification occurred
ng warmer, more humid periods of the
tocene. (Casey-Arizona)

*Soil formation, *Alluvium, *Soil water, Mont-
morillonite, Crop production, Deserts, Arid lands, Arable land, Brown soils, Soil physical properties, Hydraulic conductivity, Clays, Quartz, Sands, Silts, Particle size, Land development, Terraces (Geological), Semiarid climates, Pleistocene Epoch, Quaternary Period, Fine-texture soils, Soil types.
Identifiers: *Iraq, *Semiarid lands, *Land use capabilities, Haplargrid soil, Torrifluvent soil, Xerothermic interval, Quaternary pedology, Holocene alluvium, Feldspars.

Deserts, widespread during the Xerothermic Interval (6000 to 4000 yrs. B.P.), occupy a third of the earth's land area, including most arable land of Iraq. Understanding the composition of these soils is important for advances in Quaternary pedology and for food production in arid lands. This quantitative mineralogical analysis of one Haplargid (Brown) soil (Pleistocene terraces of northern Iraq), and three Torrifluvent (Alluvial) soils (stratified, fine textured Holocene alluvium of north and central Iraq) provides a means of understanding soil formation and properties, and land use capabilities (alkalinity, nutrients, salinity). Montmorillonite, important to hydraulic conductivity, is the dominant clay, the remaining minerals being mica, vermiculite, quartz, feldspars and stratified silicates with chlorite and mica. Quartz is the dominant sand and silt mineral, the remainder being albite, microcline, mica, vermiculite, chlorite, montmorillonite, and traces of serpentine, amphibole, sepiolite, palygorskite and kaolinite. Mineral ratios are discussed. Quartz and feldspars decrease, while montmorillonite, mica and vermiculite increase with decreasing particle size. Haplargid and two Torrifluvent surface horizons had uniform mineralogy. Tables include soil formation factors of some great soils and feldspar contents and ratios. Figures show soil locations, sand and soil mineralogy and X-ray diffractograms of clay and mica. (Popkin-Arizona)

SATURATION-UNSATURATION TRANSITION IN INFILTRATION TO A NON-UNIFORM SOIL PROFILE,
Technion--Israel Inst. of Tech., Haifa.
Dan Zaslavsky.
Soil Science, Vol 107, No 3, March 1969, p 160-165. 5 fig, 9 ref, 15 equations.

Descriptors: *Saturated flow, *Unsaturated flow, *Infiltration, *Soil water movement, *Flow resistance, Hydraulic conductivity, Flow profiles, Groundwater, Interfaces, Infiltrometers, Soil surfaces, Reservoir leakage, Artificial recharge, Resistance, Arid lands, Equations, Flow rates, Pressure head, Soil physical properties, Permeability, Depth, Measurement, Control.
Identifiers: *Control surface layer, *Vertical flow, 2-dimensional flow, 3-dimensional flow, Water head, Circumference buffering, Infiltration ring.

Transition from saturated to unsaturated flow, flow profile analysis with depth to groundwater, and hydraulic conductivity as a depth function were studied. Groundwater does not influence the infiltration rate unless it comes very near the interface between layers. Infiltration rate is proportional to ponded water head only at high heads. With a control surface layer, infiltration ring measurements need no circumference buffering to preserve vertical flow. It is necessary that the ring walls be pushed through the less permeable surface layer. Infiltration rate is unaffected by the flow divergence below the control layer. When the top layer is much more permeable, it is impossible to form a vertical downward flow under a limited infiltration area, and the overall infiltration rate will decrease with increase in wetted soil surface. The control layer concept can be qualitatively extended to 2 and 3 dimensional flow. Flow resistance along a stream tube decreases with increased distance from point of entry. One figure enables one to define some equivalent flow resistance layer and an equivalent hydraulic conductivity. This approach is useful for evaluating reservoir leakage with complex topography and for computing infiltration rates in areas of artificial groundwater recharge. Figures show pressure head and distribution in unsaturated flow, transition heads, experimental and theoretical infiltration rates, and unsaturated soil portion as a head function. (Popkin-Arizona)

MICROBIAL POPULATIONS IN STUBBLE-MULCHED SOIL,
Agricultural Research Service. Northern Plains Branch; and Nebraska Univ., Lincoln. Agricultural Experiment Station.
Fred A. Norstadt, and T. M. McCalla.
Soil Science, Vol 107, No 3, March 1969, p 188-193. 4 tab, 2 fig, 13 ref.

Descriptors: *Stubble mulching, *Bacteria, *Fungi, *Nebraska, *Microorganisms, Wheat, Actinomycetes, Crop production, Soil moisture, Erosion, Permeability, Drainage, Root zone, Loess, Sampling, Cultivation, Rotations, Soil microbiology.
Identifiers: *Microbial populations, *Subtilling, *Penicillium, *Trichoderma, *Patulin, Residues, Semiarid lands.

The purpose of this paper is to consider the numbers of Penicillium urticae Bainier and Trichoderma sp. P. urticae B., total bacterial and fungal counts, and patulin amounts in stubble-mulched soil at three east-to-west locations across Nebraska. Soil samples were obtained from Lincoln, North Platte and Alliance, Nebraska. Soils at the sites were on Peorian loess and have deep root zones, good internal and surface drainage, and moderate permeability. Rotations were established to study stubble mulching in relation to erosion, moisture storage and crop yields. Subtilling increased total bacterial actinomycetes and fungi. P. urticae B. numbers increased in subtilled compared with plowed soil or with subtilled soil with removed crop residue. Subtilling did not increase Trichoderma sp. Growth of associated microorganisms changed wheat straw into a favorable substrate for P. urticae B. P. urticae B. numbers were highest in spring and fall, and lowest in summer in subtilled soil, whereas Trichoderma sp. numbers were reversed in this trend. The anatagonism of P. urticae B. to Trichoderma mediated by patulin could cause this inverse trend. Patulin was detected in field samples at 1.5 ppm in soil and 40 to 75 ppm in wheat straw residue. Yield reduction with subtilling could be partially due to patulin production. Tables and figures quantify these relations. (Popkin-Arizona)

SIMILITUDE CONCEPT IN PARTIALLY SATURATED SOILS,
Regional Inst. of Tech., Jamshedpur (India). Dept. of Applied Mechanics.
S. V. Kameswara Sarma.
Text also in French. Journal of Hydraulic Research, Vol 8, No 4, p 477-492, 1970. 16 p, 4 fig, 2 tab, 4 ref.

Descriptors: *Hydraulic models, *Soil water movement, *Hydraulic similitude, Saturated flow, Unsaturated flow, Seepage, Model studies, Mathematical studies, Capillary action, Diffusivity, Canal seepage, Dams.
Identifiers: *Partially saturated flow.

Linear scale ratios were established for partially saturated steady and unsteady states of flow in soils. These deductions were verified for two-dimensional flows through earth dams and canals. The results obtained from experimental investiga-

tion on graded sand models agree closely with theoretical deductions made for steady flow phenomena. They differed for unsteady saturated fronts because diffusivity was not simulated to scale. (Knapp-USGS)

GREAT LAKES SHORELAND MANAGEMENT AND EROSION DAMAGE CONTROL FOR MICHIGAN.
Michigan Water Resources Commission, Lansing. Dept. of Natural Resources.

Department of Natural Resources, WDS-4, January 1970. 18 p, 21 fig. Supported by a Water Resources Council Grant.

Descriptors: *Shore protection, *Erosion control, *Great Lakes, *Littoral drift, *Soil erosion, *Flood damage, Bank stability, Michigan, Lake shores, Lake Erie, Lake Michigan, Lake Huron, Seiches, Wind tides, Land management, Sediment control.
Identifiers: *Shoreland management.

A program has been developed and introduced to the Michigan Legislature to provide for the protection, effective management, and maintenance of the quality of the Great Lakes shorelands of Michigan. Included are provisions to: require zoning of shorelands; establish the responsibilities of the Department of Natural Resources and the Water Resources Commission; authorize engineering and special studies of the shorelands; and develop a comprehensive plan for the use of the shorelands. The shorelands of some of Michigan's southern counties are over 80 percent developed. Erosion is a natural process; however, when water levels are high and when high winds occur, damage can be severe. In addition to damages caused by normal weather during high water, there is a threat of short but violent fluctuations from seiches that can inundate large areas within minutes. Primary damage results from erosion of the shoreline, causing physical loss of land areas, trees, structures, docks, homes, cottages and roads. Accelerated sedimentation impairs water quality, increases domestic water treatment costs, destroys aquatic life and habitat, and fills river mouths. A shoreland management program should give first priority to assuring that new developments along the Great Lakes will not be subject to erosion effects. A partnership management program between the Michigan State government and local governments is suggested. (Poertner)

Available from NTIS as PB-197 123, $3.00 in paper copy, $0.95 in microfiche. Technical Report 21, June, 1970. 16 p, 2 tab, 1 fig, 5 ref. OWRR Project No. A-007-NY (2).

Descriptors: *Nutrients, *Phytoplankton, *Stratification, Phosphates, Silicates, New York, Water pollution effects, Aquatic environment, Lakes.
Identifiers: *Cayuga Lake (N.Y.).

The role of nutrients in regulating phytoplankton populations remains a problem of central importance in aquatic ecology. It is of particular interest during the period of summer stratification. Cayuga Lake was used in this study since it is a favorable environment for investigating nutrient effects on phytoplankton. It is strongly stratified in the summer, and both phosphate and silicate are reduced to low levels, whereas nitrate remains relatively abundant. During 1966, Hamilton performed a series of nutrient enrichment experiments in which he tested effects of major nutrient elements on rates of 14-C uptake in short-term experiments. During the summers of 1967 and 1968 similar enrichment experiments were continued and were described here. Water samples for experiments and for nutrient and phytoplankton analyses were obtained from mid-lake between Portland Point and Taughannock Point for both years. Silicate and phosphate for the two summers were shown and compared to Hamilton's values for 1966. The phytoplankton populations were more difficult to compare. A total of seven experiments were completed in 1967 and the results were summarized. The following summer the experiments were modified and twelve additional experiments were then performed. The results of all nineteen experiments were then summarized. A discussion and comparison of the experiments of 1967 and 1968 followed.

Descriptors: *Limnology, *Lakes, *Virginia, Winter, Aquatic environment, Biological properties, Chemical properties, Surface waters, Fresh water, Thermocline, Water chemistry, Hydrologic data, Data collections, Water temperature, Plankton, Zooplankton, Chemical analysis, Benthos, Tripton, Water quality.
Identifiers: *Lake Wilcox (Virginia).

A fourteen week winter limnological investigation was conducted on Lake Wilcox, Virginia from January 22 until April 23, 1969. The purpose of the study was to gain information concerning the winter populations of phytoplankton and zooplankton as well as the chemical and physical characteristics of the water. Plankton populations were generally negligible, with only a few different genera observed. Winter phytoplankton genera consisted mainly of diatoms, and zooplankton genera were primarily rotifers. A high allochthonous tripton load limited the Secchi-disc transparency to 0.8 m or less throughout the study. Iron was found in low quantities (1.0 to 3.5 ppm). Phosphates were generally low (0.06 to 0.25 ppm at surface, 0.06 to 0.23 ppm at 3m, and 0.06 to 0.29 ppm, benthic). Hydrogen-ion concentration and bicarbonate alkalinity showed Lake Wilcox to be neutral to slightly alkaline. Calcium was quite low with a maximum of 9.4 ppm during earlier sampling dates under winter conditions, and decreased to 3.3 ppm under spring conditions. (Woodard-USGS)

ASUREMENT OF WATER POTENTIAL TH THERMOCOUPLE PSYCHROMETERS: NSTRUCTION AND APPLICATIONS,
est Service (USDA), Logan, Utah. Intermoun-Forest and Range Experiment Station.
W. Brown.
DA Forest Serv Res Pap INT-80, 1970. 27 p.

criptors: *Water measurement, *Moisture ss, *Water loss, *Soil-water-plant relationships, oisture tension, *Soil moisture meters, *Soil er, Plant physiology, Soil moisture retention, physics, Soil water movement, Wilting point, e energy, Equilibrium, Hygrometry, Utah.
ntifiers: *Thermocouple psychrometers, *Soil er potential, *Plant water potential, Soil-plant-osphere continuum, *Plant-water relations, il water relations.

use and construction of the thermocouple chrometer for measurements of soil and plant er potential are discussed. The effects of ceram-nd screen protective cups on the rates of water or exchange between the soil mass and the chrometer cavity are compared. The ceramic imposes a much greater resistance to vapor hange than the screen cups; the magnitudes of sible errors resulting from this resistance in esti-es of water potential are discussed. Possible s of thermocouple psychrometers for measuring er potentials of soils and plants under intensive est management practices are considered. own-Forest Service)

ntifiers: *Thermocouple psychrometers, ater potential, Soil-plant-atmosphere contiuum, ter potential gradients, Plant water stress, ant water relations.

ter potentials of trees growing under natural ditions were measured in situ with thermocou-psychrometers. Miniature models of chrometers used in soil research were inserted oles drilled into the outer xylem of tree trunks branches as small as 2 cm diameters. (The chrometers had been calibrated at different peratures in solutions of known osmotic value, these calibrations were used in calculating the ter potential from the psychrometer readings.) ter potentials decreased with increasing tance from the roots; they were also lower on hot, dry days than on rainy days or at night. Water potentials of twigs, determined with the pressure chamber technique, were always lower than those of the respective branches, while water potentials of leaf sections determined with a laboratory psychrometer were even lower. These studies confirm a continuous gradient of decreasing water potential from soil to trunk, branches, twigs and leaves. The branches studied were within 2 m of the ground, and the gradients were probably caused by resistance within the trees rather than altitudinal differences. The three methods agreed with each other, and can be used for measuring water potentials in situ in the entire soil-plant-leaf system. (Brown-Forest Service)

LEAF SAMPLER FOR RELATIVE WATER CONTENT MEASUREMENTS: DESIGN AND APPLICATION,
Forest Service (USDA), Logan, Utah. Intermountain Forest and Range Experiment Station.
Ray W. Brown.
Agronomy Journal, Vol 61, p 644-647, July-August 1969.

Descriptors: *Moisture content, *Soil-water-plant relationships, Water balance, *Water loss, *Wilting point, *Bouyoucos blocks, *Moisture availability, *Moisture stress, *Moisture tension, Soil moisture meters, Soil moisture, Wilting, Transpiration, *Water measurement, Utah.
Identifiers: Relative water content, Leaf cutter, Relative turgidity.

A leaf sampler capable of holding eight samples has been designed and used for measuring the relative water content of plant tissues. The precision-made leaf cutter and sample chambers permit the collection of leaf tissue disks from leaves still attached to the plant. After excision, tissue samples can be sealed immediately in small vials within the sample chambers to prevent evaporative water loss. Relative water content values of orchardgrass leaf samples obtained with the leaf sampler were higher, without exception, than were the values of similar samples obtained with a cork borer. However, these differences were not significant until permanent wilting was approached. (Brown-Forest Service)

ASPEN SPROUT PRODUCTION AND WATER USE,
Forest Service (USDA), Ogden, Utah. Intermountain Forest and Range Experiment Station.
Robert S. Johnston.
USDA, Forest Serv Res Note INT-89, 1969. 6 p, 3 fig, 3 tab.

Descriptors: *Water loss, *Soil water, *Evapotranspiration control, Soil moisture, Soil water, Nuclear moisture meters, Soil moisture meters, Forest management, Watershed management, Vegetation effects, Mountain forest, Utah.
Identifiers: Aspen trees.

Sprouting response and soil moisture depletion on aspen plots were compared under four experimental conditions: (a) clearcut, (b) clearcut, stumps sprayed with sodium arsenite, (c) basal injection of sodium arsenite, and (d) control. Numbers of sprouts varied with treatment for 2 years, but after 4 years the numbers of sprouts on all plots were about equal. Clearcutting the aspen reduced soil moisture depletion by 3 to 4 inches in a 6-foot soil profile during each of three growing seasons. (Johnston-Forest Service)

FORMATION OF PHYTOGENIC HILLOCKS II. ROOTING HABIT OF PLANTS FORMING PHYTOGENIC HILLOCKS,
Cario Univ., Giza (Egypt). Faculty of Science; and Ministry of Agriculture, Cairo (Egypt). Soil Research Dept.
K. H. Batanouny, and M. H. Batanouny.
Acta Botanica Academiae Scientiarum Hungaricae, Vol 15, No 1-2, p 1-18, 1969. 14 fig, 8 ref.

Descriptors: *Root development, *Xerophytes, *Halophytes, *Physiological ecology, *Soil-water-plant relationships, Arid lands, Salt marshes, Soil water, Grasses, Soil physical properties, Water utilization, Monocots, Dicots, On-site investigations, Root systems, Root distribution, Plant growth, Environmental effects, Saline water, Root zones, Deserts, Sands.
Identifiers: *Egypt, *Adventitious roots, *Phytogenic hillocks, Shoots.

A number of arid zone plant species growing in deserts, coastal dunes and salt marshes are able to form phytogenic mounds. During or after the formation of the mounds, root and shoot modifications occur. Particularly outstanding is the development of adventitious roots. In an effort to describe in detail and discover the physiological significance of these structural changes, 7 Egyptian species were investigated: Artrochnemon glaucum, Anabasis articulata, Suaeda pruinosa, Aristida scoparia, Limoniastrum monopetalum, Zygophyllum album and Pennisetum dichotomum. The root systems--both primary and adventitious--were uncovered and drawn, the floristic associations at the site described, soil properties analyzed and areal water conditions noted. It was concluded that soil accumulation stimulated adventitious root formation which may often be greater in surface area than the primary roots. These roots function in accumulating organic matter and binding soil water, probably being responsible for a considerable part of total plant water uptake. The plants are classified according to adventitious root structure: I. Monocotyledenous species--long, thread-like roots; II. Dicotyledenous species, Type A-Laterals similar to primaries; Type B-Hairy, fine, short and only in mound body; Type C-Both long, thread-like and tufted, fine. (Casey-Arizona)

PERENNATION IN ASTRAGALUS LENTIGINOSUS AND TRIDENS PULCHELLUS IN RELATION TO RAINFALL,
California Univ., Los Angles. Lab. of nuclear Medicine and Radiation Biology.
Janice C. Beatley.
AEC Contract No. AT (04-1) Gen-12. Madrono, Vol 20, No 6, p 326-332, April 1970. 2 tab, 2 ref.

Descriptors: *Arid lands, *Rainfall, *Soil moisture, *Plant populations, Ecology, Environmental effects, Nevada, Grasses, Legumes, On-site data collections, Rain gages, Plant growth, Biological communities, Elevation, Seasonal, Germination, Xerophytes, Deserts, Annual.
Identifiers: *Perennation, *Transects, *Adaptability, *Seedlings, Mojave Desert.

In late winter-early spring of 1965, unusually heavy rains fell at the Nevada test site in south-central Nevada. These were followed by conspicuously large numbers of A. lentiginosus (Leguminosae) and T. pulchellus (Gramineae). In late autumn, 1965, the rains were even heavier and were followed in the spring of 1966 by spectacular flowering populations of A. lentiginosus. On permanent study sites in the area, year-round data collections were kept on environmental variables and plant populations. Most of the Astragalus seedlings lived to flower the following spring, then died. These were distinctly biennials. Perennial populations occurred mostly at higher elevations associated with more frequent and greater rainfall. Seeds of T. pylchellus may germinate in either spring or fall and, for the most part, the plants exhibit a winter annual growth regime. It appears that germination is dependent on soil moisture and perennation is dependent on rainfall regularity. In plants such as Astragalus the ability to occur as annuals, biennials or perennials, may confer a high level of adaptability to a wide range of environmental conditions. (Casey-Arizona)

ROOT DEVELOPMENT OF TWO COMMON SPECIES IN DIFFERENT HABITATS IN THE MEDITERRANEAN SUBREGION IN EGYPT,
Cairo Univ., Giza (Egypt). Dept. of Botany.
K. H. Batanouny, and M. A. F. Zaki.
Acta Botanica Acadamiae Scientiarum Hungaricae, Vol 15, No 3-4, p 217-226, 1969. 3 fig, 12 ref.

Descriptors: *Soil physical properties, *Root development, *Arid lands, *Plant growth, *Soil-water-plant relationships, On-site investigations, Xerophytes, Environmental effects, Soil chemical properties, Soil structure, Soil texture, Soil moisture, Percolation, Plant populations, Plant morphology, Vegetation establishment, Root systems, Root zone, Ecology, Cultivated lands, Distribution patterns.
Identifiers: *Egypt, Plant associations.

Plant species of widespread distribution show great differences in growth and vitality in differeing areas. Studies of the causes of these differences, particularly in terms of root systems, may yield information on soil and water relations, allowing an adequate assessment of areal crop potential. Root systems and soil properties of 2 common Mediterranean coastal species, Thymelaea hirsuta and Pithyranthus tortuosus, were studied in 5 different plant associations. Soil penetrability was measured with a stratometer. The root systems of both species were shallowest in an association on a degraded, stony, hardly penetrable soil with a low moisture content, and this was accompanied by a relatively small plant size. In an area where this soil was cultivated for barley, the root systems of T. hirsuta were much deeper and the plant much larger. Since it is felt that species genetic potential for growth does not differ between areas, the effect of cultivation must have been a change in soil structure such that resistances to root penetration, percolation and aeration were much lower. This was supported by much lower soil penetrability measurements in the cultivated areas. (Casey-Arizona)

Identifiers: *Sweating, *Sonoran Desert, *Anthropology, *Adaptability.

The problem of racial differences in heat tolerance has not been fully investigated in hot, arid climates. Previous evidence infers that acclimatization is a factor at least as important as genetic differences. Groups of Yacqui Indians and Mestizos from Hermosillo, Sonora, Mexico, and Caucasian University students and Papago Indians from Tucson, Arizona, were subjected to exercises in arid summer heat and their physiological responses were measured. The Mestizos and Yaquis showed no significant differences in heart rate, rectal temperatures or sweat rate. However, when White students were compared to Papago Indians, the latter had significantly lower rectal temperatures and sweat rates, which could be accounted for in part by their smaller size. None of the groups demonstrated characteristic changes of acclimatization. In hot, humid environmentally controlled rooms, the Yacquis and Mestizos fell into an intermediate position between acclimatized and unacclimatized Caucasions. It is concluded that desert acclimatization does not confer maximal acclimatization to humid heat. The lower rectal temperatures of the Papagos may represent a more effective, hereditary heat dissipation mechanism. (Casey-Arizona)

MINERAL AND CHEMICAL COMPOSITION OF SEDIMENTS FROM THE STRAITS OF FLORIDA,
Atlantic Oceanographic and Meteorological Labs., Miami, Fla.
John D. Gassaway.
Journal of Sedimentary Petrology, Vol 40, No 4, p 1136-1146, December 1970. 11 p, 8 fig, 3 tab, 38 ref.

Descriptors: *Mineralogy, *Bottom sediments, *Currents (Water), *Sediment transport, *Provenance, Florida, Sampling, Dispersion, X-ray analysis, X-ray diffraction, Trace elements, Tracking techniques, Cores, Statistical methods, Distribution patterns.
Identifiers: *Florida Straits, Gulf Stream.

In the Straits of Florida the Florida Current contributes a low-magnesian calcitic biogenic ooze, the Bahama Banks supply highly aragonitic sediments, and 'relict' sediments are the source for the detrital silicates and phosphates. The Miami Terrace Reef has a relatively large amount of high-magnesian calcite. Offshore currents carry the detrital material southward until they are blocked by the Florida Current. Aragonitic sediments move westerly from the Bahama Banks. The mineral suite of the Straits of Florida sediments is composed principally of biogenic carbonates except to the northwest. Strontium and chromium are positively correlated with aragonite. Strontium is not significantly enriched in the carbonate sediments after deposition. Manganese and cobalt vary directly with each other, and statistical analysis shows that they are present in the same phase. The Florida Current is a principal source for the distribution of manganese and cobalt in the Straits of Florida. Iron, zinc and chromium are correlated with the 'relict' sediments to the northwest where their most probable source is the carbonate-fluorapatite. (Knapp-USGS)

Northwestern Univ., Evanston, Ill.
Thomas A. Jones.
Journal of Sedimentary Petrology, Vol 40, No 4, 1204-1215, December 1970. 12 p, 6 fig, 6 tab, 2 ref, append.

Descriptors: *Particle size, *Statistical method Frequency analysis, Charts, Surveys, Gradin Histograms, Sediments.
Identifiers: *Particle size distributions.

Weight-frequency data are routinely analyze either by moment computations or by graphics (percentile) techniques. However, both method have serious drawbacks. The moment measures ar biased, and may have errors induced by groupin or by truncation of part of the sample (pan frac tion). The graphical measures may have error because of interpolation of percentiles. More seri ously the graphical statistics are highly interrelated so varying amounts of skewness and kurtosis wi affect the estimates of all parameters. Because bot the moment and graphical methods have defect an alternative estimation technique is desirable Fitting a cumulative Edgeworth distribution to th observed cumulative data provides estimates whic do not have these undesirable properties. A brie replication study shows that the variance of th Edgeworth estimates is generally less than those o the graphical and sample moment estimates. (K napp-USGS)

DEPOSITIONAL AND DISPERSAL DYNAMICS OF INTERTIDAL SAND BARS,
Illinois Univ., Urbana. Dept. of Geology.
George DeVries Klein.
Journal of Sedimentary Petrology, Vol 40, No 4, p 1095-1127, December 1970. 33 p, 34 fig, 8 tab, 7 ref.

Descriptors: *Sand bars, *Tidal effects, *Intertidal areas, *Sediment transport, *Sedimentary structures, Currents (Water), Coasts, Shoals, Dispersion, Sedimentary basins (Geological), Tracers, Dye releases, Water circulation, Beaches, Tides, Waves (Water), Mud flats, Sedimentation.
Identifiers: *Minas Basin (Nova Scotia).

The intertidal sand bars of the Minas Basin, Nova Scotia, are asymmetrical in cross-section and linear in plan. They are formed and reworked by tidal currents which are characterized by an asymmetric time-velocity profile. Average bottom ebb current velocities (90 cm/sec) exceed average bottom flood current velocities (65 cm/sec) over gently-sloping (2 to 3 degree) bar surfaces, whereas over steep-sloping (8 degree) bar surfaces, average bottom flood current velocities (90 cm/sec) were found to exceed average bottom ebb current velocities (65 cm/sec). On steeper bar slopes, the sediment is fine-grained sand and is characterized by airholes, planar lamination, and surface dunes and ripples. On the gentler bar slopes, the texture of the sediment is medium-grained and coarse-grained sand which has been fashioned into current ripples, simple dunes, complex dunes, simple sand waves and complex sand waves. Individual tracer grains are dispersed in a radial-elliptical pattern from a point source. The sand bars are aligned parallel to basinal topographic trend and in turn segregate zones of flood- and ebb-dominated bottom current systems. Comparison of low-tide air-photos taken in 1938, 1947, and 1963 in one of the study areas shows a slight erosional regime. (K-napp-USGS)

IRICAL RELATIONSHIPS BETWEEN S PHYSICAL PROPERTIES FOR RECENT INE SEDIMENTS OFF SOUTHERN IFORNIA,
heed Missiles and Space Co., San Diego, . Ocean Lab.
Inderbitzen.
ne Geology, Vol 9, No 5, p 311-329, mber 1970. 19 p, 7 fig, 5 tab, 29 ref.

riptors: *Bottom sediments, *Physical proper- *Moisture content, *Clay minerals, *Particle Sedimentation, Mechanical properties, Sedi- ation rates, Deposition (Sediments).
tifiers: *Sediment physical properties.

physical property data, obtained by testing cores of recent marine sediments in and nd the continental borderland, were analyzed letermine the relationship between shear gth and sedimentation rate. General increases found in clay and water content with distance ore. Values for void ratio of the sediment in- e with increasing clay-size fraction and ease with increasing shear strength. The slope e void ratio-percent clay relationship appears ed to sedimentation rate: the steeper the slope, aster the rate of deposition. Both the increase ear strength and decrease of water content depth in the sediment appear to be linear func- . There appear to be no direct correlations een sedimentation rate and: (1) amount of size material in the sediment; (2) rate of shear gth increase with depth; or (3) rate of water ent decrease with depth in the sediment. As mentation rate increases, so does the range of r content a sediment may contain for a given entage of clay. The exact limits of that range dependent on the clay mineralogy. As the unt of water within the sediment increases, the r strength decreases. Therefore, the more dly a given material is deposited the more water n contain and the lower its shear strength. RADIOMETRIC INVESTIGATIONS ON THE BEACH AT THE MOUTH OF THE KURA RIVER,
B. S. Shteyman, A. N. Shatsov, A. N. Tsitsarev, A. A. Yemel'yanov, and V. T. Myshkin.
Translated from Trudy ZakNIGMI, No 32 (38), p 68-78, 1969. Soviet Hydrology: Selected Papers, Issue No 5, p 511-518, 1969. 8 p, 5 fig, 2 tab, 14 ref.

Descriptors: *Deltas, *Sedimentation, *Tracers, *Tracking techniques, Radioactivity techniques, Littoral drift, Sediment yield, Sediment load, Bed load, Suspended load, Provenance, Coasts, Shores, Beach erosion.
Identifiers: *Kura River (USSR).

The movement of sediments on the beach at the mouth of the Kura River, USSR, was studied by various methods, the most promising of which uses the natural radioactivity of the sediments. Natural radioactivity is easily sensed by instruments even at low concentrations, and it is independent of external factors. Sediments contain a large amount of radioisotopes of radium, strontium, rubidium, potassium, and other elements. Radiometric methods were used in the investigation of sedimentation at the mouth of the Kura River because standard methods are laborious, point sampling does not exclude an element of randomness, and, most important, sediment sampling over a large water area is time consuming and requires good weather. The radiometric method permits rapid and continuous investigation of deposition of river sediments in the beach area. The longshore flow of Kura River sediments is from the north and toward the beach area of the main southeastern arm. Solid discharge through the northeastern arm is negligible (0.6 million tons/year). The decrease in the flow of sediments through this arm from 50% (1938) to 5% (1965) of the total discharge of the Kura River has produced severe abrasion of the delta shore. Hydraulic conditions in the channel are responsible for the dying out of the northeastern arm. (Knapp-USGS)

SOME ASPECTS OF THE FORMATION OF MUDFLOWS AND METHODS OF COMPUTING THEM,
Yu. B. Vinogradov.
Translated from Trudy KazNIGMI, No 33, p 5-29, 1969. Soviet Hydrology: Selected Papers, No 5, p 480-500, 1969. 21 p, 8 fig, 1 tab, 16 ref, 3 append.

Descriptors: *Mudflows, *Floods, Classification, Erosion, Sediment transport, Mass wasting, Sedimentation, Sedimentology, Geomorphology, Sediment yield, Open channel flow.
Identifiers: *Mudflow classification.

A classification scheme of mudflow phenomena is presented. The classification is based on the following principle: the input is the character of hydrometeorological processes that lead to given flood conditions; the qualitative transformation operator is the type of mudflow source, which reacts in a definite manner to the hydrometeorological situation; and at the output is the type of mudflow process. Hydrometeorological conditions of mudflow formation include heavy showers of sufficient duration, extremely fast rate of snow melting under exceptional conditions (such as volcanic eruptions, for example), and waves of water released during breaches of temporarily impounded lakes or artificial mountain reservoirs. The types of catchments include catchments with active surface runoff, erosional mudflow sources composed of loose and relatively easily destroyed and eroded material with occasional inclusions of rock fragments, erosional mudflow sources consisting of blocky rock debris with a highly erosible filler, and rocky mudflow sources. Types of mudflow phenomena are mud floods, gravity flows of soil suspension, and gravity rock flows. (Knapp-USGS)

HYDRAULIC CRITERIA OF STREAMS WITH A MOBILE BOTTOM,
N. S. Znamenskaya.
Translated from Trudy Gos Gidrol Inst-ta, No 173, p 43-48, 1969. Soviet Hydrology: Selected Papers, No 5, p 452-455, 1969. 4 p, 1 fig, 5 ref.

Descriptors: *Scour, *Sediment transport, *Bed load, Alluvial channels, Open channel flow, Hydraulics, Channel morphology, Froude number, Reynolds number, Viscosity, Tractive forces, Roughness (Hydraulic).
Identifiers: *Mobile-bed streams.

The main forces determining turbulent flow are gravity, inertia, and viscosity. The most common criteria used in the hydraulics of open channels are dimensionless relationships including Froude number, which allows for the forces of intertia and gravity, and Reynolds number, which takes into account the forces of inertia and viscosity. Hydraulic criteria must be used with criteria reflecting the mobility of the sediments. Mobility depends on size and specific weight. Dimensionless ratios used as criteria of bed load mobility include the ratio of average velocity to nonscouring velocity, and the ratio of the drag force to the critical drag force. The fact that the start of particle movement is related to observable velocity and drag data is in favor of these or similar criteria. The best criterion in use at present is the ratio of average velocity to fall velocity because: (1) the fall velocity may be determined much more accurately than the nonscouring velocity; (2) the variation in fall velocity with temperature is known; and (3) results have been obtained from study of the variation of fall velocity with the concentration of suspended particles. PATTERN OF VARIATION OF THE LENGTH OF FREELY MEANDERING RIVERS,
E. A. Konditerova, and I. V. Ivanov.
Translated from Trudy Gos Gidrol Inst-ta, No 169, p 3-17, 1969. Soviet Hydrology: Selected Papers, No 4, p 356-364, 1969. 9 p, 5 fig, 1 tab.

Descriptors: *Meanders, *Alluvial channels, Geomorphology, Channel morphology, Rivers, Stream erosion, Scour, Sediment transport, Sedimentation.
Identifiers: *Irtysh River, *USSR, Stream length.

In studying the morphometric patterns of various types of channel processes the Department of Channel Processes of the State Hydrologic Institute, USSR, examined the patterns of free mean-

dering. This type of channel process occurs over about half (42%) of the length of the Irtysh River reaches studied. The purpose of this study was to determine the main patterns of change in river length under free meandering conditions. On the whole, the entire reach of the Irtysh River under study has shortened by only 650 m between 1904 and 1958. This reach (380 km long), confined to a morphologically uniform, free meandering stretch without tributaries, is an example of a closed cycle of length changes of a type of channel process where free meandering clearly predominates. With predominantly free meandering, the increase in the length of meanders during their horizontal deformations was compensated by breaches in channel loops. The rapid elongation of individual meanders may stabilize the development of neighboring meanders by reducing the rates of their horizontal deformations. (Knapp-USGS)

MUD FLOWS AND FLOODS AND THEIR CONTROL,
M. S. Gagoshidze.
Trans from Gidrotekhnika i melioratsiya, No 11, p 29-43, 1969. Soviet Hydrology: Selected Papers, No 4, p 410-422, 1969. 13 p, 10 fig, 2 tab, 11 ref.

Descriptors: *Mudflows, *Flood control, Dams, Floods, Check structures, Regulation, Sediment transport, Flood protection, Flash floods, Diversion, Flow control.
Identifiers: *Mudflow control, USSR.

Mudflows are dense, cohesive, and structured. The water in the mud mass is bound and does not perform a transporting function. Mud floods are fluid, turbulent, and noncohesive. The water in them is enriched with a colloidal suspension and is the transporting medium. Mudflows are the most destructive type of mountain runoff. They form in nearly all the mountain regions of the Soviet Union. Protection from mudflows and improvement of a mudflow basin is achieved by a combination of organizational-agricultural, phytoreclamation, and hydraulic engineering measures. Hydraulic installations are used to control mudflows that have already formed. (1) Mudflow regulating structures are designed to conduct, direct, discharge, and break the mudflows. (2) The mudflow separating structures (contracted weirs, openwork dams, cable mud cutters, and sediment barriers) are designed to arrest the coarse and pass the small fraction of the mudflow. (3) Solid structures (dams, excavations, dikes) are built to arrest mudflows and other types of mountain flow. Arresting structures with openings (openwork dams) are built to arrest the mudflow mass and pass the flood runoff. (4) Mudflow transforming sturctures are designed to transform structural mudflows into floods. (Knapp-USGS)

SEDIMENT TRANSPORT IN DEGRADING RIVERS,
California Univ., Berkeley. Dept. of Civil Engineering.
Hans A. Einstein.
California University Water Resources Center Technical Completion Report, January 22, 1969. 6 p. OWRR Project A-023-CAL (1).

Descriptors: *Sediment transport, *Degradation (Stream), *Reviews, *Stream erosion, *Dams, Streams, Flow control, Equilibrium, Streamflow, Investigations, Model studies, Flumes, Channel morphology, Streambeds, Stress, Flow resistance, Boundaries (Surfaces), Flow rates, Sediments, Cross-sections, Bed load, Statistical analysis, Friction, Scour, Particle size.
Identifiers: Dam effects on downstream channels.

When a dam is constructed across a river the equilibrium of sediment movement is greatly disturbed causing the river downstream to start degrading, a process that continues until a new equilibrium is reached. This report summarizes studies made on the subject since 1963. Some of the results are as follows: (1) The friction factor for a flow over a sediment bed is usually divided into two parts, the grain resistance and the shape resistance. Both are present in a degrading bed of uniform material the same as in an equilibrium flow. In mixed beds, segregation must be taken into account. (2) A flume study conducted in a circular flume of rectangular cross section showed that the shape of the sediment bed may be predicted from the velocity distribution. (3) A generalized shape of river cross-sections can be predicted as a function of the river curvature of the channel preceding the section. (4) Check experiments verified that during scour the roughness of a mud bottom is somewhat higher than at equilibrium. At equilibrium the mud, consisting of silt and clay in salt water, is hydraulically smooth. (5) Scattered blocks on a slowly scouring sediment bed of small sediment transport will by their additional resistance first reduce the shape resistance of the bed, and only after that will they reduce the sediment transport and scour. (Woodard-USGS)

ON THE ACCURACY OF BED-MATERIAL SAMPLING,
Waterloopkundig Laboratorium, Delft (Netherlands).
M. de Vries.
Text also in French. Journal of Hydraulic Research, Vol 8, No 4, p 523-533, 1970. 11 p, 2 fig, 1 tab, 2 ref.

Descriptors: *Sampling, *Bottom sediments, *Statistical methods, *Statistics, *Sieve analysis, Analytical techniques, Sands, Gravels, Particle size, Sieves, Measurement, Data collections, Probability, Variability.
Identifiers: *Bed sediment sampling.

The minimum amount of sediment to be sampled for a valid statistical analysis was determined analytically and compared with results of field studies. The results of the analysis are especially valuable if relatively coarse sediments are studied. For fine sand the samples are usually large enough to assume the presence of small errors. Coarse sand and gravel require samples too large to be sieved directly. Sample splitting and sieving of all parts is required. The composition of the bed material may change with time and place. If there exists a large degree of inhomogeneity, the selection of the loc tions of sampling becomes important. In this ca the required accuracy for each sample may b rather low, unless the degree of inhomogeneity the topic to be studied (grain-sorting). (Knap USGS)

INFILTRATION AND SOIL EROSION AS INFLUENCED BY VEGETATION AND SOIL IN NORTHERN UTAH,
Forest Service (USDA), Reno, Nev. Intermountain Forest and Range Experiment Station.
R. O. Meeuwig.
Journal of Range Management, Vol 23, No 3, p 185-188, May 1970. 4 p, 8 fig.

Descriptors: *Infiltration, *Erosion, *Vegetation effects, *Soil properties, Soil aggregates, Soil density, Organic matter, Soil surfaces, Utah, Soil moisture, Simulated rainfall.
Identifiers: *Slope gradient.

The influences of vegetation, soil properties, and slope gradient on infiltration capacity and soil stability of high-elevation herbland on the Wasatch Front in northern Utah were investigated under simulated rainfall conditions. Results emphasize the importance of vegetation and litter cover in maintaining infiltration capacity and soil stability. Infiltration is also affected significantly by soil properties, notably bulk density, aggregation and moisture content. (Meeuwig-Forest Service)

INFILTRATION AND SOIL EROSION ON COOLWATER RIDGE, IDAHO,
Forest Service (USDA), Reno, Nev. Intermountain Forest and Range Experiment Station.
R. O. Meeuwig.
USDA Forest Service Research Note INT-103, 1969. 5 p, 2 fig.

Descriptors: *Infiltration, *Erosion, *Vegetation effects, Soil texture, Organic matter, Wettability, Idaho, Simulated rainfall.
Identifiers: *Non-wettable soils.

The infiltration and erosion caused by simulated rainfall were measured on a granitic subalpine ridge in north-central Idaho. Erosion was closely correlated with the amount of exposed soil. Infiltration was not highly correlated with any single factor. However, three soil properties (organic-matter

ent, clay content, and moisture-holding city at 20-centimeter tension) in combination found to be good predictors of infiltration. euwig-Forest Service)

A GEOCHEMICAL TREND IN SILICON-ALUMINUM-IRON RATIOS AND THE CLASSIFICATION OF CLASTIC SEDIMENTS,
Kentucky Univ., Lexington.
Bruce R. Moore, and William H. Dennen.
Journal of Sedimentary Petrology, Vol 40, No 4, p 1147-1152, December 1970. 6 p, 2 fig, 1 tab, 38 ref.

Descriptors: *Sediments, *Weathering, *Diagenesis, *Metamorphic rocks, *Provenance, Geochemistry, Igneous rocks, Classification, Aluminum, Iron, Sediment transport.
Identifiers: *Sorting (Sediments), Silicon.

Plots of the principal elements Si, Al, Fe for normal clastic sediments reveal a very definite geochemical trend for these elements. Al/Fe ratios lie between 1.5 and 2.5 while Si is continuously variable but has clearly distinguishable ranges for each of the currently used sediment types when plotted on a Si-Al-Fe ternary diagram. Igneous rocks undergoing weathering tend to move in composition toward the Si, Al, Fe 'main sequence' and later separate by hydraulic sorting toward either the coarser quartzose sandstone or finer shale ends of this sequence. The results indicate the possibility of clarification of existing classifications and of determining the parent-rock types of certain metasediments. (Knapp-USGS)

MICROBIAL CARBONATE AND PHOSPHATE PRECIPITATES FROM SEA WATER CULTURES,
Smithsonian Institution, Washington, D.C.
P. G. Malone, and K. M. Towe.
Marine Geology, Vol 9, No 5, p 301-309, December 1970. 9 p, 3 fig, 27 ref.

Descriptors: *Water chemistry, *Carbonates, *Phosphates, *Sea water, *Biodegradation, Nitrates, Organic matter, Chemical precipitation, Nutrients, Calcium carbonate, Calcite, Diagenesis, Connate water.
Identifiers: Struvite.

Nitrogenous organic materials were allowed to decompose in seawater at approximately 24 deg C under varying conditions of aeration. In aerated cultures the mineral struvite (NH4-MgPO4.6H2O) is formed by a reaction between phosphate and ammonia from the decomposing organic material and magnesium in the seawater. Cultures grown in paper-plugged flasks produced precipitates consisting of struvite and monohydrocalcite. Cultures grown in tightly-stoppered flasks produced a precipitate consisting of calcite containing approximately 14 mol% MgCO3 and struvite. The uncomplicated nature of these results suggests that similar phases may be produced in varying natural situations where nitrogenous organic material decays in seawater or in contact with interstitial water in sediments. (Knapp-USGS)

THE DIFFUSION OF IONS IN UNCONSOLIDATED SEDIMENTS,
Woods Hole Oceanographic Institution, Mass.
F. T. Manheim.
Earth and Planetary Science Letters, Vol 9, No 4, p 307-309, November 1970. 3 p, 1 fig, 1 tab, 20 ref.

Descriptors: *Diffusion, *Ion transport, *Sediments, *Porosity, Diffusivity, Aqueous solutions, Electrolytes, Translocation, Ion exchange, Diagenesis, Viscosity, Water temperature, Clays, Clay minerals, Connate water.
Identifiers: *Ion diffusion.

Diffusion in unconsolidated sediments generally proceeds at rates ranging from half to one twentieth of those applying to diffusion of ions and molecules in free solution. Diffusion rates are predictable with respect to porosity and path tortuosity in host sediments, and can be conveniently measured by determinations of electrical resistivity on bulk sediment samples. Net ion flux is further influenced by reactions of diffusing species with enclosing sediments, but such influences should not be confused with or lumped with diffusion processes. (Knapp-USGS)

SUBMARINE VOLCANISM AS A SOURCE FOR IRON,
Rosenstiel School of Marine and Atmospheric Sciences, Miami, Fla.
Kurt Bostrom.
Earth and Planetary Science Letters, Vol 9, No 4, p 348-354, November 1, 1970. 7 p, 6 fig, 12 ref.

Descriptors: *Water chemistry, *Iron, *Sea water, *Distribution patterns, *Geochemistry, Solubility, Chemical precipitation, Volcanoes, Aqueous solutions, Sediments, Deposition (Sediments).
Identifiers: Iron distribution (Pacific).

Deposition rates of iron on the East Pacific Rise are 4-30 times larger than in surrounding areas of the Pacific, suggesting local volcanism to be the source of iron. The distribution of Co, Ni, Mn, Ti and Al support this conclusion. Other geochemical relations in the East Pacific also suggest that the iron sediments on the Ridge are of local origin. Stability relations for oxides-hydroxides of Fe, Mn, Ni and Co suggest that in the well-oxygenated slightly alkaline bottom waters of the ocean, iron should precipitate out fairly fast, followed by manganese, whereas Ni and Co should be most mobile and tend to be enriched in the moist land-distant areas. Because continental matter has been recycled repeatedly during the history of the Earth while the volcanic iron described may represent a new contribution to the surface of the Earth, and because ocean floor spreading may have been operating during most of the history of the Earth, it follows that a large fraction of the total amount of iron now at the Earth's surface may have been brought up by submarine volcanism. (Knapp-USGS)
W71-03955

CHEMICAL EXCHANGE BETWEEN SEA WATER AND DEEP OCEAN BASALTS,
Naval Oceanographic Office, Washington, D.C. Project GOFAR.
Roger Hart.
Earth and Planetary Science Letters, Vol 9, No 3, p 269-279, October 1970. 11 p, 4 fig, 2 tab, 40 ref.

Descriptors: *Basalts, *Hydration, *Ion exchange, *Mineralogy, *Water chemistry, Distribution patterns, Leaching, Solubility, Elements (Chemical), Sea water, Weathering, Chemical reactions.
Identifiers: *Oceanic basalts.

Analysis of 112 deep ocean basalts reported in the literature show systematic chemical trends in major elements with distance from ridge spreading centers. These same trends are observed in the weathering of single pillows and produce a chemical composition similar to volcanic alkali basalts. Upon hydration by sea water, tholeiitic ridge basalts give off silica, calcium, magnesium, and gain potassium, iron, titanium, manganese, sodium and phosphorus. Aluminum shows no apparent change. The yearly contribution to sea water in nanograms of the major elements per cc of basalt is estimated at Si—..7.4, Ti—-1.6, Fe—-3.3, Mn—0.06, Mg—..2.3, Na—-0.21, Ca—..2.1, K—-0.9, and P—-0.14. (Knapp-USGS)
W71-03956

SOME CHARACTERISTICS OF THE THERMAL REGIME OF RIVERS IN THE DANUBE AND DNIESTER BASINS,
N. G. Dyukel.
Translated from Trudy UkrNIGMI, No 85, 1969, p 104-111. Soviet Hydrology: Selected Papers, No 4, p 381-387, 1969. 7 p, 4 fig, 4 tab, 5 ref.

Descriptors: *Water temperature, *Climates, *Altitude, *Surface-groundwater relationships, *Thermal pollution, Surveys, Data collections, Hydrologic data.
Identifiers: *USSR, *River thermal regime.

The thermal regime of rivers in the Tissa, Seret, Prut, and Dniester basins, USSR, is determined by climatic conditions and, primarily, by air temperature. The strongest disturbances are observed in reaches where groundwater discharges. The thermal regime is also strongly affected by human activity, such as the discharge of warm industrial waters into rivers, river regulation by ponds and reservoirs, etc. To characterize the thermal regime of rivers, an analysis was made of natural and artificially disturbed regimes in a thermal survey. The natural thermal regime was analyzed separately for river reaches with strong and with moderate groundwater recharge. The relationship between air and water temperatures was found to be single-valued on river reaches with moderate groundwater recharge. The thermal regime in such reaches varies with latitude in lowland rivers and with elevation in the mountain rivers. The air temperature lapse rate is 0.7 deg C, while the vertical water temperature gradients of rivers in the Dniester basin is 1.6 deg C and in the Danube basin 1.3 deg C. In the cold months (January-March, November, December), the vertical water temperature gradient practically drops to zero. The greatest scatter of points is observed for the warm months (May-September) when the thermal regime is affected even by insignificant local factors, when the difference between the ground and river-water temperatures is the greatest. (Knapp-USGS)

SPECTROPHOTOMETRIC DETERMINATION OF CHLORATE ION,
Missouri Univ., Columbia. Dept. of Chemistry.
Norman L. Trautwein, and John C. Guyon.
Analytica Chimica Acta (Amsterdam), Vol 41, p 275-282, 1968. 8 p, 7 fig, 1 tab, 7 ref.

Descriptors: *Chemical analysis, *Spectrophotometry, *Chlorides, *Methodology, *Test procedures, Analytical techniques, Research and development, Chemistry, Evaluation, Instrumentation, Ions, Chemical reactions, Absorption, Laboratory tests, Ionization.
Identifiers: *Chemical analysis (Chlorate ion).

A simple, direct, sensitive spectrophotometric method for the determination of chlorate ion is described. The method is based upon the interference of chlorate ion on the formation of a rhenium-alpha-furildioxime complex, whose absorbance maximum is at 532 millimicrons. The effect of several variables is described. The range for the method is 0-5.0 parts per million of chlorate ion. A variety of ions were added to the system in order to study interferences. The principal interferences are copper, thiocyanate, tungstate and uranyl ions. Copper and uranium increase the absorbance and diminish the interference of the chlorate ion. Thiocyanate ion produces a yellow color with perrhenate in the presence of tin chloride. Tungstate forms a precipitate on the addition of tin chloride. (Woodard-USGS)

QUALITY OF SURFACE WATERS OF THE UNITED STATES, 1965: PARTS 7 AND 8. LOWER MISSISSIPPI RIVER BASIN AND WESTERN GULF OF MEXICO BASINS.
Geological Survey, Washington, D.C.

For sale by Superintendent of Documents, US Government Printing Office, Wash, DC 20402 - Price $3.50. Geological Survey Water-Supply Paper 1964, 1970. 819 p, 1 fig, 32 ref.

Descriptors: *Water quality, *Surface waters, *Mississippi River Basin, *Data collections, *Hydrologic data, Chemical analysis, Water temperature, Sediment transport, Suspended load, Sediment discharge, Particle size, Sediment load, Streamflow, Water properties, Water chemistry, Sampling, Laboratory tests, On-site investigations, Runoff, Flow rates.
Identifiers: *Lower Mississippi River Basin, *Western Gulf of Mexico Basins.

During the water year ending September 30, 1965, the U. S. Geological Survey maintained 127 stations on 61 streams for the study of chemical and physical characteristics of surface water in the lower Mississippi River Basin and Western Gulf of Mexico Basins. Samples were collected daily and monthly at 125 of these locations for chemical-quality studies. Samples also were collected less frequently at many other points. Water temperatures were measured continuously at 2 and daily at 83 stations. Quantities of suspended sediment are reported for 34 stations. Sediment samples were collected one or more times daily at most stations, depending on the rate of flow and changes in stage of the stream. Particle-size distributions of sediments were determined at 22 of the stations. Descriptive statements for the basic-data tables are given for each regular sampling station. These statements include location of the station, drainage area, periods of records available, extremes of dissolved solids, hardness, specific conductance, temperature, sediment loads, and other pertinent data. Records of discharge of the streams at or near the sampling station are included in most tables of analyses. (Woodard-USGS)

ARSENIC IN POTABLE DESERT GROUNDWATER: AN ANALYSIS PROBLEM,
Naval Weapons Center, China Lake, Calif. Michelson Labs.; and Boron Community Services District, Calif.
G. C. Whitnack, and H. H. Martens.
Science, Vol 171, No 3969, p 383-385, January 29, 1971. 3 p, 2 fig, 2 tab, 12 ref.

Descriptors: *Arsenic compounds, *Analytical techniques, *Trace elements, *Water pollution, *Groundwater basins, *California, Hydrogeology, Deserts, Potable water, Mineral water, Water analysis, Methodology, X-ray fluorescence, Adsorption, Water chemistry.
Identifiers: *Analysis problem, Arsine evolution, Mohave Desert.

As the result of conflicting reports made in 1969 on the arsenic content of drinking water from ground water sources in the Mohave Desert, a comprehensive study was made of the analytical methods in use. Results of this study and of the consequent investigation of metal interference in the arsine (AsH_3) evolution step are described. Gallon samples of water collected from each of 24 sites were analyzed within 30 days of collection, using techniques of x-ray fluorescence and single-sweep polarography. Data reported by the SDDC method were confirmed for certain of the well waters. Groundwaters of the Boron and China Lake basins are associated with many water-soluble minerals and are more brackish or briny than the usual surface waters for which the colorimetric SDDC method was developed. It is concluded that interference with the evolution of arsine in the American Public Health Association silver diethyldithiocarbamate method used in the 1969 analyses caused either color enhancement or arsine suppression, and this method is unreliable for certain natural water types. MINERAL RECOVERY FROM CONCENTRATED BRINES,
Brigham Young Univ., Provo, Utah.
Joseph M. Glassett.
Fore sale by the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402. Price $0.75. Office of Saline Water Research and Development Progress Report No 593, December 1970. 79 p, 17 fig, 8 tab, 13 ref, 2 append. OSW Grant 14-01-0001-1302.

Descriptors: *Brines, *Brine disposal, *By-products, *Phase diagrams, *Ultimate disposal, Sodium chloride, Potassium compounds, Magnesium compounds, Sodium sulfate salts, Solubility, Aqueous solutions.
Identifiers: Mineral recovery, Phase rule processes.

al mineral recovery processes are proposed udy to profitably recover valuable minerals the concentrated brine effluent of saline conversion plants. Phase rule processes ap- particularly attractive since no raw materials eeded except the brine itself. The principal ss studied involves: (1) solar evaporation to specific gravity to remove sodium chloride the brine, (2) dilution with 15 volume per fresh water, (3) cooling to -15C to recover mirabilite crystals, (4) a second evaporation 9 specific gravity to remove additional sodi- hloride, (5) dilution with 5 volume per cent water, (6) a second cooling to recover pure e, and (7) a third evaporation to recover car- e and a strong MgCl2 brine. The yield of e was found to be low so as alternative process ggested. This alternative process involves ing the second dilution and cooling steps. The d evaporation in three stages can produce , sylvinite, and carnallite. Sylvite may be ered from sylvinite and from carnallite by nt commercial methods. The residue brine ontain principally magnesium chloride. When ater brine was evaporated to a magnesium ntration of four weight per cent or more, epsomite was obtained during the first cooling instead of mirabilite. (Scott-Office of Saline r)

SAND WAVES AND TIDAL CHANNELS IN THE ENTRANCE TO CHESAPEAKE BAY,
Old Dominion Univ., Norfolk, Va. Inst. of Oceanography.
John C. Ludwick.
Virginia Journal of Science, Vol 21, No 4, p 178-184, 1970. 7 p, 6 fig, 20 ref. ONR Contract No N00014-70C-0083.

Descriptors: *Sedimentary structures, *Sand waves, *Tidal waters, *Bays, *Channel flow, Channel morphology, Alluvial channels, Currents (Water), Flow characteristics, Sands, Sand bars, Profiles, Waves (Water), Shoals, Sediment transport, Velocity, Shear stress.
Identifiers: *Chesapeake Bay entrance, *Tidal channels.

Sand waves 5-12 feet in height and 200-1200 feet in length occur in water 25-50 feet deep in the sand bank and tidal channel area of the entrance to Chesapeake Bay. Most waves are asymmetrical in transverse profile, some facing with ebb currents, others facing with flood currents, depending on which is dominant at a given place. Steep slopes on the various waves range from 4 to 21 deg and average 12 deg. The sand waves occur in association with tidal channels and especially on the flanks of shoals that form channel boundaries. Migration of sand waves, judged from their facing direction, is a bed sediment transport mechanism by which sand is moved up onto shoals. Many large shoals of the area occur between ebb-dominated and flood-dominated channels. This implies the existence of net circulation loops of water and sediment in cells located over shoals. The action of such cells is to trap sediment. Other ebb-flood shear zones may mark sites of future shoaling in the entrance. (Woodard-USGS)

SURFACE CHEMISTRY STUDIES ON THE BAY OF PANAMA,
Naval Research Lab., Washington, D.C.
J. D. Bultman, W. D. Garrett, N. L. Jarvis, and J. B. Romans.
Available from NTIS as AD-713 142, $3.00 in paper copy, $0.95 in microfiche. Memorandum Rept. No NRL-MR-1435, June 1963. 15 p, 10 fig, 1 tab, 2 ref.
Identifiers: *Sea water, *Surface-active substances, *Monomolecular films, *Oceans, Interfaces, Chemical analysis, *Surface chemistry, *Panama Bay.

A field trip was made to the Bay of Panama during the week of April 8 through April 12, 1963. The purpose of the trip was to carry out experiments dealing ultimately with the surface chemistry of the sea. Surface and subsurface water samples were collected to determine the nature of the adsorbed films that occur on the sea and to learn more of their origin. Experiments were also carried out to determine the rate of adsorption of surface active material at the sea/air interface, and to determine force-area curves for the stable film forming constituent. Efforts were also made to measure in a given small area the percent coverage of the sea by surface active material. In addition, measurements were made of the film pressure of slick covered areas, and an attempt was made to correlate these measurements with the changes in surface potential. Each experiment is discussed briefly in this report with appropriate conclusions and recommendations.

POROUS TUBULET SUPPORTS FOR DESALINATION BARRIERS,
DeBell and Richardson, Inc., Hazardville, Conn.
Bernard Baum, Roy A. White, W. H. Holley, W. R. Diehl, and R. C. Trudeau.
For sale by the Superintendent of Documents, U. S. Government Printing Office, Washington, D.C. 20402 Price $1.00. Office of Saline Water Research and Development Progress Report No. 604, December 1970. 98 p, 17 tab, 20 fig, 7 ref. OSW Contract 14-01-0001-2211.

Descriptors: *Reverse osmosis, *Separation techniques, Pressure, Desalination processes, Membrane processes, *Osmosis.
Identifiers: Membrane supports, *Support tubes, Microporous supports.

Rigid micrporous thermoplastic materials have been developed on a laboratory scale, the best of which, a PVC (polyvinyl chloride) homopolymer, has been successfully extruded into tubulets. These polyvinyl chloride tubulets were leached in water to give porous tubulets which had the desired pore size and reasonable flux. Porous materials in flat sheet form were formulated with a number of polymers and screened for porosity, flux and pore size. The porosity in these materials was produced by compounding water-soluble liquids, salts, resins, or gums into the various rigid thermoplastics, molding them into flat sheets, and extracting the water-soluble materials to produce porous, water-permeable sheets. Water flux was determined by passing distilled water through the sheets at 20-40 psig pressure in a Gelman stainless steel pressure filter funnel, and collecting the effluent in a graduated cylinder. Pore size was established in a preliminary manner by determing if either 1 micron (10,000A) or 0.2 micron (2,000A) latex particles would pass through the sheet or tubulet. Several lots of 0.060' and 0.030' outside diameter polyvinyl chloride tubulets containing polyvinyl methyl ether and a surfactant as the water-leachable components were extruded. One series was extruded from milled compound and the other, to reduce thermal degradation, was extruded from dry blend. (Kindley-Office of Saline Water)

WATER TRANSPORT THROUGH PLASTICIZED MEMBRANES,
Weizmann Inst. of Science, Rehovoth (Israel).
D. Vofsi, and O. Kedem.
For sale by the Superintendent of Documents, U. S. Government Printing Office, Washington, D.C. 20402 Price $0.65. Office of Saline Water Research and Development Progress Report No. 591, December 1970. 60 p, 15 tab, 9 fig. OSW Contract 14-01-0001-961.

Descriptors: Desalination, Ion exchange, Ion transport, Membranes, *Membrane processes, Permselective membranes, *Reverse osmosis, *Semipermeable membranes, Separation techniques, *Osmosis.
Identifiers: Hyperfiltration, Pressure dialyais.

'Liquid' and 'plasticized' solvent membranes are of interest as possible analogues of biological systems. Semipermeable homogeneous films are prepared by plasticizing polyvinylchloride with organic phosphates. Water permeability of such films is relatively high. Conditioning of a 'plasticized' membrane, under the osmotic gradient of solution of sodium nitrate leads to profound although usually reversible changes in its morphology and to a drastic increase of its water permeability. Their reversibility in various solutions may be correlated with the respective differences in permselectivity. Porous charged membranes were prepared previously by crosslinking polypeptides in a collodion matrix. Using the same technique polylysine and polyvinylamine can be used as polyelectrolytes, whereas Procion Brilliant Orange MG acts as crosslinking agent. This material can either crosslink polyamines or bind them to a cellulosic matrix. Membranes prepared by this method permit high rate fluxes, but the salt rejection is quite low. However, good separation between hydrochloric acid and copper chloride are obtained in the same membranes; while the acid concentrates in the product, most of the salt remains in the feed. EVALUATION OF THE VERTICAL TUBE EVAPORATOR AND THE MULTISTAGE FLASH DESALINATION PROCESSES.
Fluor Corp. Ltd., Los Angeles, Calif.

For sale by the Superintendent of Documents, U. S. Government Printing Office, Washington, D.C. 20402 Price $4.25. Office of Saline Water Research and Development Progress Report 580, August 1970. 226 p. OSW Contract 14-01-0001-1830.

Descriptors: *Cost comparisons, *Design criteria, *Desalination processes, *Flash distillation, *Long-tube vertical distillation, Water costs, Capital costs, Desalination, Desalination plants, Distillation, Evaporators, Desalination apparatus, Heat balance, Thermodynamic behavior, Saline water.
Identifiers: *Enhanced surface tubes, Corrugated tubes.

The objectives of this study were to determine, compare and evaluate the relative thermodynamic and engineering characteristics and economics of the Vertical Tube Evaporator (VTE) and the Multistage Flash (MSF) desalination processes. Also, included was a determination and assessment of the relative reliability, maintainability, and potentials of the two types of plants. Capital costs and operating costs were determined and are reported in detail. The main conclusions of the study were: (1) for large size plants (250 mgd) a VTE plant appears to have a distinct economic advantage over the corresponding MSF design; (2) the use of enhanced surface (corrupted) tubes in a large MSF plant would reduce its cost, although the cost of the VTE plant would still be substantially lower; and (3) for plants of 2.5 MGD size, capital costs and production costs for the two types of plants evaluated (VTE and MSF) are very nearly the same, however, the use of enhanced surface tubes in the MSF plant could make that process more economical. BOLSA ISLAND NUCLEAR POWER AND DESALTING PROJECT FACILITIES (COST AND DESCRIPTION) AND COST OF DESALTED WATER,
Southern California Metropolitan Water District, San Diego.
Henry J. Mills.
For sale by the Superintendent of Documents, U. S. Government Printing Office, Washington, D.C. 20402. Price $2.50. Office of Saline Water, Research and Development Progress Report No. 570, August 1970. 119 p, 26 tab, 2 fig, 19 plates, 3 ref. OSW Contract 14-01-0001-1290.

Descriptors: *Desalination plants, *Flash distillation, *Nuclear powerplants, Dual-purpose, Desalination, *Costs.
Identifiers: Desalting costs.

The purpose of this report is to review the Bolsa Island desalination project supported jointly by the Metropolitan Water District of Southern California, Office of Saline Water, Atomic Energy Commission and three power utilities in the area: The project called for an overall system with seawater desalting plant of 150 mgd capacity and a nuclear power plant with a projected output of 1900 mw. The project was terminated before any construction was started. However, extensive plant, site and economic studies were completed. This report reviews these activities with particular emphasis on cost projections for the plant and resulting water cost. Special features of the report are the man-made island to be used as a plant site (opposite Bolsa Chica State Park), the combined nuclear power desalting system, projected designs for flash distillation plant, the water delivery system and the detailed cost analysis made. SECOND REPORT ON HORIZONTAL-TUBE MULTIPLE-EFFECT PROCESS PILOT PLANT TESTS AND DESIGN,
Universal Desalting Corp, New York.
R. B. Cox, G. A. Matta, A. S. Pascale, and K. S. Stromberg.
For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D. C. 20402. Price $1.50. Office of Saline Water Research and Development Progress Report No 592, May 7, 1970. 128 p, 20 fig, 3 ref, 3 append. OSW Contract 14-01-0001-2247.

Descriptors: Design criteria, Dropwise condensation, Films, Pilot plants, Evaporation, *Heat transfer, Distillation, *Desalination.
Identifiers: Experimental data, Extended heat transfer surfaces, Film evaporation, Film condensation, Heat transfer improvements, Boiling promotion, Heat transfer coefficients, *Horizontal tube evaporators, *Multiple effect distillation, Non-condensable removal.

A single-effect test unit at the OSW Wrightsville Beach Plant as described in OSW R and D Progress Report No. 492 has been automated for continuous operation. Data obtained during previous short-duration tests were confirmed by continuous operation and by a specific 500-hour run. The factors that influence the overall heat transfer coefficient were further delineated. The effect of various surface enhancements on the heat transfer coefficient was determined and coefficients two to three times those in LTV smooth tubes were obtained. A 3-effect test unit was designed to determine the parameters associated with inter-effect operation and to demonstrate the adequacy of designs for larger sized plants. The report contains a description of this 3-effect test unit together with a discussion of the operating parameters and design innovations to be demonstrated future tests.

criptors: *Membranes, *Semipermeable membnes, *Dialysis, Osmosis, Membrane processes, alination.
ntifiers: *Inorganic membranes, Ferrocyanide s, Membrane structure.

e structure and morphology of the classic semimeable membrane, cupric ferrocyanide, and he 40 other heavy metal ferro-, ferri-, and cobalyanides were studied by isobaric dehydration, x- and electron diffraction, low angle electron difction, infra-red, and Mossbauer spectroscopy. shly precipitated cupric ferrocyanide gel was nd to be composed of 10 A amorphous particles t age under water to become crystalline within to 15 minutes. After about 20 hours, platelike particles appear, exhibiting new diffraction lines corresponding to a larger cubic unit cell, and yielding a step-wise dehydration isobar. In the absence of the plates, this cupric ferrocyanide complex exhibits a bivarient dehydration isobar similar to some 30 other cyanide complexes studied. The pore structure of heavy metal cyanide complexes was found to consist of interstices between spheroidal or platelike particles, with the morphology more significant than the particle size. Hydrated cupric ferrocyanide is unique in forming sheets, assumed to be the active semi-permeable structure, water being transported through the channel like interstices, regular in this case, but irregular in membranes composed of spheroidal particles. (Leiserson-Office of Saline Water)

REVERSE OSMOSIS DESALTING STATE-OF-THE-ART (1969).
Hittman Associates, Inc., Columbia, Md.

For sale by the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402. Price $0.75. Office of Saline Water Research and Development Progress Report No 611, October 1970. 73 p, 10 tab, 23 fig, 16 ref. OSW Contract 14-01-0001-1748.

Descriptors: Desalination, *Reverse Osmosis, Economics, Waste water treatment, *Osmosis, *Membranes, Membrane processes, Costs, Desalination plants, *Revies, *Desalination apparatus, Separation techniques.
Identifiers: Reverse osmosis plants.

The report reviews current technical and engineering economic aspects of the reverse osmosis (RO) desalting process. The RO process is a viable technique for the desalting of brackish water feed. Research indicates that seawater desalting is possible but not yet practical. Brackish water production plants with capacities up to 100,000 gpd are operational. Economical RO desalting is strongly dependent upon the operating performance and economic characteristics of the membrane and its support structure. Much of the attractiveness of the RO process is associated with the low energy consumption requirements. Projections of costs are made for plants up to 50 million gallons per day of product water. (Sturza-Office of Saline Water)

PROGRESS IN WATER DESALINATION TECHNOLOGY,
Desert Inst., Ashkhabad (USSR).
M. V. Kolodin.
Trans From Problemy Osvoyeniya Pustyn', 1970, No 3, p 64-72. Soviet Georgraphy: Review and Translation, Vol 11, No 10, p 858-864, December 1970. 1 fig, 4 tab, 15 ref.

Descriptors: *Water supply, *Desalination processes, *Hydrologic budget, *Cost-benefit analysis, *Water costs, Arid lands, Distillation, Electrodialysis, Flash distillation, Long-tube vertical distillation, Separation techniques, Vapor compression distillation, Energy dissipation, Dual purpose, Electric power production, Evaporators, Economic feasibility, Freezing, Heating, Runoff, Surface waters, Technology, Technical feasibility, Research and development, Water pollution effects, Water utilization, Water reuse, Domestic water, Industrial water.
Identifiers: *USSR, *Atomic reactors.

Originally, human water supply problems existed only in the hot, arid regions, but by the middle of the 20th century, they also existed in highly industrialized urban areas. The earth's annual runoff is 37, 130 cu.km., of which mankind is now using about 10% (3,308 cu.km.), divided between irrigation (2,500 cu.km.) and domestic and industrial uses (563 cu.km.). The major concern is not so much increasing consumption levels as water pollution, and current data suggests that increased pollution will soon create severe water shrotages. Natural water costs are rising as a result of additional treatment needs and diversion from remote areas. It is felt that the solution lies in more thorough treatment processes combined with increasing desalination. Research and development efforts in desalination processes were relatively late in beginning in the Soviet Union, but from 1963-1967, 10 large, producing plants were built, mostly in arid areas. In 1963 the first large 4-chamber long-tube distillation plant was completed at Shevchenko (KazakhSSR) and had a capacity of 5000 cu.m./day, a cost of 143 kopecks/cu.m. and a power consumption of 0.19 billion cal./cu.m. By 1967 a 5-stage flash distillation plant had been built in Krasnovodsk with a capacity of 1200 cu.m./day and a cost of 72 kopecks/cu.m. A secondary refrigerant freezing plant is being designed to have a capacity of 36,000 cu.m./day with a cost of 24.3 kopecks/cu.m. It is felt that dual purpose plants combining saline water conversion with electric power production, are particularly economical. (Casey-Arizona)

CLOUD SEEDING POTENTIALITIES IN LOS ANGELES COUNTY.
North American Weather Consultants, Pasadena, Calif.

Los Angeles County Flood Control District, Los Angeles, Report 15-1, October 1952. 102 p, 12 fig, 9 tab.

Descriptors: *Cloud seeding, *Cloud physics, *Meterology, *Storm structure, *Artificial precipitation, *Rain, Precipitable water, Weather patterns, Storm structure, Silver iodide, Chemistry of precipitation, Water supply, Storm runoff, Water resources, Hydrologic cycle, Cost-benefit analysis, California.
Identifiers: *Los Angeles County, San Gabriel Mountains.

Cloud seeding methods are discussed for both winter and summer seasons and the economic value of a program is estimated for Los Angeles County. Historical weather records, characteristics of Southern California storms and the physical factors underlying naturally and artificially produced precipitation are examined. Final conclusions and

recommendations are that cloud seeding in Los Angeles County is economically feasible, self supporting, and safe if carried out on a controlled plan basis. It appears that this is true with respect to both winter and summer seeding. It is recommended that cloud seeding be confined to the San Gabriel Range and the desert region to the North thereof in the winter and to the San Gabriel Range in the summer. Furthermore, it is recommended that ground generators be used in winter, and that ground generators be used in conjunction with aerial operations in the summer. Although systematic seeding can be expected to produce precipitation increases of the order of between 20 to 40 percent, a limited seeding plan is recommended. This plan would produce in an average year a minimum of 6500 acre feet of salvable storm flow, worth at least $130,000, plus an additional 20,000 acre feet of sustained summer flow worth over $500,000. A MORE RIGOROUS EXPRESSION FOR THE RATE OF DROPLET GROWTH,
Atmospheric Sciences Lab., White Sands Missile Range, N. Mex.
Richard D. H. Low.
Available from NTIS as AD-713 559, $3.00 in paper copy, $0.95 in microfiche. 1970. 13 p, 4 fig, 15 ref.
Identifiers: *Artificial precipitation, Mathematical analysis, *Water vapor, Condensation, Nucleation, Vapors, Diffusion, Integration, Weather modification.

One facet of weather modification is the dissipation of a warm fog or the improvement of visibility within it by means of seeding with condensation nuclei. The analysis of the effectiveness of this type of nuclei finds its roots in the mathematical expression for condensational growth - one of the few fundamental equations in cloud physics which has, only during the past twenty years, been recognized as a distinct branch of physical meteorology and, more recently, as an integral part of atmospheric physics. Being a young science, cloud physics has embodied areas of study which are in need of better understanding and further development, one such area being the processes of condensation and precipitation. The fundamental equation is applicable to the growth of an isolated and immobile saturated solution droplet in a stationary medium of moist air. It is the purpose of this paper to examine this equation critically from a theoretical point of view.

OPTIMAL ALLOCATION OF STOCHASTIC WATER SUPPLY,
California Univ., Riverside. Dry-Lands Research Inst.; and New South Wales Univ., Kensington. School of Civil Engineering.
Warren A. Hall, and David T. Howell.
Journal of the Irrigation and Drainage Division, ASCE, Vol 96, No IR4, p 395-402, December 1970. 8 p, 1 tab, 6 ref, 2 append.

Descriptors: *Optimization, *Stochastic processes, *Linear programming, *Dynamic programming, *Water allocation (Policy), Constraints, Streamflow, Regulated flow.
Identifiers: *Nonlinear system.

An example of the use of water rights as a social constraint was presented for an arid or semiarid agricultural region such as exists in much of the southwestern portion of the United States. It was presumed that the quantity of water which will be available in any year could be assessed with reasonable accuracy at the beginning of the growing season of that year. The particular device used was the allocation of the probability of receiving water rather than the allocation of water per se. First, allocation of stochastic water supply by a linear system was described. A series of linear programming problems, each with one constraint, was shown in tabular form. The use of dynamic programming as an alternate procedure was developed in the section on nonlinear systems. The problem of solving real optimal water-allocation was resolved by allocating the probability of receiving water, i.e., the seniority of the right rather than the water alone. The probability used represented the stochastic component of a stream-flow. Since the method concerned the residual stochastic component, first the net returns from the regulated, or nonstochastic, portion of the flow were produced by the project and then, the difference between the optimal return from the residual unregulated (stochastic) flow and the optimal return from the original unregulated flow were added algebraically so as to make a more precise evaluation of a particular project proposal. No attempt was made to apply the method to a municipal-industrial system. (Kriss-Cornell)

THE HYDROLOGY OF SAGEBRUSH LANDS AND THE MANAGEMENT OF BLOWING SNOW,
Forest Service (USDA), Laramie, Wyo. Rocky Mountain Forest and Range Experiment Station.
Ronald D. Tabler.
Hydrology Seminar, University of Wyoming, Proceedings, p 11-15, June 25-26, 1970.

Descriptors: *Research facilities, *Sagebrush, *Snow management, Soil-water-plant relationships, Water yield improvement, Snowpacks, Wyoming.
Identifiers: *Snow fences.

The hydrology of sagebrush lands and the effec sagebrush control on water yield are being stu by the Rocky Mountain Forest and Range Exp ment Station at the Wayne's Creek Watersh (elev. about 9500 ft) near Dubois, Wyoming, at the Stratton Study Area (elev. about 7500 near Saratoga. At both of these areas, waters of 60 to 1600 acres are instrumented for stre flow, precipitation, snow storage, sediment yi soil moisture, climatic data, and vegetative prod tion and ground cover. On the Pole Moun Study Area, near Laramie, snow fences are be tested as a means of increasing snow accumulat and snowmelt runoff. A snow fence 12 1/2 ft and 1300 ft long, built during the summer of 19 is expected to about double snow accumulation the 111-acre watershed. Effects of this treatm on snow accumulation, total annual streamfl and seasonal distribution of flow will be stud over the next five years. (Tabler-Forest Service)

WATERSHED MANAGEMENT IN THE UNITE STATES: CONCEPTS AND PRINCIPLES,
Forest Service (USDA), Logan, Utah. Intermou tain Forest and Range Experiment Station.
P. E. Packer, and W. A. Laycock.
New Zealand Agr Eng Inst, Lincoln College, Ca terbury, New Zealand, Lincoln Papers in Wat Resources No 8, Part 1, p 1-22, 1969. 60 ref.

Descriptors: *Water yield improvement, *Wat quality, *Water yield, *Watershed manageme *Watersheds, Phreatophytes, United States.
Identifiers: *Watershed protection, *Watersh rehabilitation, Forest watersheds, Ran watersheds.

Without doubt, the most important watersh problems for which management solutions a needed are those concerned with how to contin timber harvesting, grazing, mining and recreation uses of watersheds without causing undue dama to soil and water. Increasing pressures from an e panding population for the multiple uses afforde by our forest and range watersheds emphasize th need for accelerated research to provide answe and for more intensive management application those answers. Of more immediate danger to so and water are those problems concerned wit restoration of satisfactory hydrologic and soil st bility conditions to damaged watersheds; howeve these problems are not nearly so widespread as and, therefore, are not of equal importance with the watershed maintenance problems. Not only research needed to further develop and refin requirements for such restoration but manageme must also demonstrate greater willingness to mak the investments necessary to rectify damaging e fects on soil and water of past misuses and abuse Finally, of somewhat less urgency--but neverthele of still great importance--are those problems con cerned largely with manipulation of vegetation t influence the amount, quality, and timing of wate yields delivered as streamflow from forest and range watersheds. ty is a factor in most of the western soils. oration of water in the soils leaves the salt ntrated in the remaining solution, building up concentration gradients even in soils contain- elatively low concentrations of total soluble These salt gradients can affect water move- both by acting osmotically and by changing il structure and water absorption capabilities. mechanisms of osmosis were delineated, odynamic dispersion coefficients were deter- d, and effects of these salt gradients on oration were determined. NaCl decreased orative CaCl2 tended to increase evaporation. dense crusts of the type formed by raindrop n tended to reduce evaporation when overly- oser soil with larger pores. The mechanisms mosis are so involved with ion type, mineral structure, and texture that much more work is ed to sort out all the interactions and develop ctive criteria.

ASPECTS OF THE SOUTH AUSTRALIAN CITRUS INDUSTRY,
Memorial Univ. of Newfoundland, St. John's. Dept of Geography.
Peter Crabb.
Scottish Geographical Magazine, Vol 86, No 1, p 41-51, April 1970. 4 fig, 3 tab, 18 ref.

Descriptors: *Citrus fruits, *Irrigation systems, *Crop production, *Marketing, *Economic efficiency, Semiarid climates, Temperature, Environmental effects, Irrigation effects, Salinity, Economic feasibility, Distribution systems, Sprinkler irrigation, Productivity, Fruit crops, Grapefruit, Oranges, Cost-benefit analysis, Water utilization, Land use, Labor, Costs, Quality control.
Identifiers: *South Australia, *Production costs.

Australia is not as yet a major citrus producing country, and South Australia accounts for only 25% of Australian citrus production. In the past 20 years, however, the rate of increase of citrus production has been far greater in South Australia than any other state and still has much potential citrus land currently unexploited. The quality of the citrus is also high. South Australia's major advantages are extensive irrigation schemes and freedom from insect pests due to climatic aridity and very stringent quarantine regulations. However, several problems are beginning to develop: (1) increasing production bringing a rising proportion of poor-quality fruit due to greater numbers of young trees, (2) a temperature regime unfavorable for grapefruit production, (3) overuse of N fertilizers, (4) salt accumulation owing to application of highly saline Murray River water by overhead sprinkler systems, (5) high labor costs, (6) decreases in world citrus prices, (7) inefficient packing and handling practices, and (8) inefficient distribution and marketing systems. Recently legislation has been passed creating a Citrus Organization Committee, which is concentrating on improved administration of the industry, collection of statistical and technical data, and marketing. The prognosis for the future is highly favorable. (Casey-Arizona)

Identifiers: *USSR.

The steppe and wooded steppe regions of the eastern USSR play a key agricultural role, producing over 80% of the nation's grain crop. In terms of total yield, yield/acre, production costs and direct labor inputs, they are far superior to Siberia and Kazakhstan. As part of a national program of increasing agricultural production, present plans call for an increase of almost 100% in grain production in the steppe areas. However, these regions are characterized by an unstable water supply. In the wooded steppe this problem can be alleviated by improved water and soil conservation measures, but in the steppe zone, irrigation will be absolutely necessary. This problem is complicated by the presence of a large number of high water-use industries in these zones. The author argues that the requirements of agriculture should be given priority in these areas and the practice of industrial location in highly agricultural regions should be discontinued. The far eastern regions of the USSR have no agriculture and are water-rich, and would therefore be much better industrial areas. (Casey-Arizona)

Identifiers: *West Africa, *Nigeria, *Cassava, *Developing countries, *Agroclimatology, Cocoa, Yams, Bananas, Location factors.

Crop plants alter their environment and are in turn acted upon by the environment. For this and other reasons, it is argued that agricultural development planning and descriptions of spatial variability should not proceed only on the basis of simple surveys of native vegetation. In Western Nigeria the savanna-forest boundary is not abrupt. Islands of forest extend for a considerable distance into the savanna. A survey of farm holdings was conducted in 1966, in the hope that it would reveal some of the factors involved in crop choices, particularly on holdings which included both forest and savanna land. The physical factors of temperature, rainfall, natural vegetation and year-round growing conditions are described, as are the social factors of farm sizes and locations relative to towns, land ownership, labor problems and the general impact of urbanization on rural areas. Commercial crops were much more extensive than crops for domestic consumption, and were shipped to the cities. Cocoa was the dominant crop in forest areas and cassava was dominant in savanna areas. The 3 major crops systems were: (1) root crops - banana-tree crops, confined to the forest, (2) maize-cassava-yams, occurring in both areas and (3) Guinea corn-root crops system, confined to the savanna. Other crops such as rice and tobacco occurred only in areas where appropriate processing facilities were available. Forest land clearance presents a major problem because of the rainly seasons. Relatively moist areas are used for growing high-priced yams where economically feasible. It is concluded that crop choices are made on the basis of a variety of economic, social and biological factors and no simple distinction occurs between forest and savanna agriculture. FEEDING A DESERT CITY: ANTOFAGASTA, CHILE,
Southern Connecticut State Coll., New Haven. Dept. of Geography.
Martin I. Glassner.
Economic Geography, Vol 45, No 4, p 339-348, October 1969. 2 fig, 5 tab.

Descriptors: *Arid lands, *Food abundance, *Economic feasibility, *Transportation, *Social aspects, Legal aspects, Deserts, Urban sociology, Import, Moisture availability, Geographical regions, Social impact, Harbors, Railroads, Distribution, Access routes, Roads, Road construction, Moisture deficit, Food habits, Climatic zones, Highway effects, Environmental effects, Limiting factors, Area development, Federal government, Attitudes, Industries, Public health, Social change, Water demand, Livestock, Prices, Agriculture.
Identifiers: *Chile, *Atacama desert, *Oases, *Antofagasta.

Antofagasta is a seaport in the heart of the Atacama, perhaps the world's driest desert. Since the only food production in the Atacama is at scattered oases, the city, with a population of 125,000, has severe food import problems. It is, however, favored by an abundant supply of fresh water and special import privileges. The major sources of food supply are: (1) imports, both from within and outside of Chile via ship, railroad and truck, (2) produce grown at the interior oases, (3) seafood acquired by inefficient, primitive methods and (4) livestock grown in limited numbers within the city. Food prices are generally high and most of the population suffers from an inadequate diet. A special law allows into the province a large number of foreign food imports forbidden to the rest of the country. The imports are taxed and the revenue is used in various projects designed to improve the food supply. These include modernization of the fishing industry and oasis agriculture, improvement of transport facilities to the city and improvement of food storage and distribution facilities within the city. Counterparts of this city are found in ill-fed desert communities around the world and it is hoped that its experiences will serve as guidelines to other areas beset by the problems of severe water-deficiency. SUPERFARMS VS. SAGEBRUSH: NEW IRRIGATION DEVELOPMENTS ON THE SNAKE RIVER PLAIN,
Portland State Univ., Oregon.
David Lawrence Smith.
Association of American Geographers, Proceedings, Vol 2, p 127-131, 1970. 9 ref.

Descriptors: *Irrigation practices, *Land reclamation, *Crop production, *Pumping, *Social change, Desert Land Act, Irrigation systems, Irrigation efficiency, Idaho, Alfalfa, Potatoes, Sugar beets, Sorghum, Barley, Arid lands, Sagebrush, Sands, Sprinker irrigation, Flood irrigation, Irrigation ditches, Land development, Political constraints, History, Legal aspects, Social aspects, Irrigable land, Water delivery, Farm management, Potations, Farm units, Cost benefit analysis, Economic feasibility, Economies of scale, Economic prediction, Federal government, Rivers, Flood plains.
Identifiers: *Bureau of land management, *Bureau of reclamation, *Snake River.

Most of the Snake River Plain is traversed by the River in a narrow canyon up to several hundred feet deep; only occasionally does the canyon widen enough for a flood-plain. The natural vegetation is a sagebrush-grass association and all environmental factors except rainfall are favorable for crop production. Irrigation projects in the area were started over 100 years ago and until 1950 were largely a result of federal involvement. Since 1950 the combination of crop prices, technical improvements in water pumps and private investment have resulted in a steady increase of land reclamation by pumping water several hundred feet up onto the plain from the Snake River. This has resulted in large, isolated farming units usually in absentee ownership. The older farms are smaller, family-oriented, require less capital and often occupy federal reclamation projects. The major crops are potatoes, barley and sugar beets. The success of the large-scale operations since 1960 ensures an adequate source of private development capital. Most of the currently undeveloped land is owned by the federal government and its acquisition by private groups has been complicated by legal and political factors. Water supplies for support of future developments seem adequate. The author forsees a doubling of irrigated land in the future. (Casey-Arizona)

THE SAM SIMON WATERSHED: SHRUB CONTROL,
Arizona Univ., Tucson. Coll. of Agriculture.
Gilbert L. Jordan, and Michael L. Maynard.
Progressive Agriculture in Arizona, Vol 22, No 5, Sept-Oct 1970, p 6-9. 6 fig, 2 tab, 3 ref.

Descriptors: *Soil management, *Watershed management, *Range management, *Brush control, *Vegetation regrowth, Plant populations, Shrubs, Phreatophytes, Erosion control, Arroyos, Soil-water-plant relationships, Gullies, Forage grasses, Soil moisture, Germination, Root systems, Mechanical control, Mesquite, Droughts, Arizona, Arid lands, Grazing, Planting management, Cacti, Desert plants, Watersheds (Basins), Competition, Balance of nature, Equipment.
Identifiers: *Perennial grass cover, Pitted chaining, Disk plowing, Root plowing, Seedling, San Simon Valley (Arizona), Semiarid lands, Creosotebush.

The San Simon Valley, a frail watershed in southeastern Arizona, is subject to excessive soil movement and arroyo formation as a result of mismanagement, over-grazing and drought. This semiarid region (less than 9.5 inches annual precipitation) is dominated by shrubs, mainly sand-dune mesquite, creosotebush and tarbush. Perennial grass cover is composed of sideoats, grama, black grama, bush muhly, spike and mesa dropseed, sacaton, Arizona cottontop, plains bristle-grass, and cane beardgrass. Vegetation improvement for erosion protection and increased forage production requires shrub removal and grass planting. Shrub removal is necessary in semiarid rangelands because shrubs use limited moisture necessary for seedling establishment and germination. Brush control study sites were selected from typical cattle-grazed rangeland and were subsequently fenced. The Bowie site has creosotebush and sand-dune mesquite communities. The communities have extensive lateral root systems and deep tap roots, which collect windblown sand. The San Simon site has communities of sand-dune mesquite, creosotebush, tarbush, and four-wing saltbush. Seeding studies, mechanical shrub control and complete to moderate brush eradication were performed during the 1963 to 1966 period. Fourwing saltbush, a palatable browse plant, was not well controlled. Soil moisture was an important factor in brush control, since mechanical control tends to be more effective when moisture is low. Root and disk plowing and pitted chaining effectiveness is shown in two tables; six photographs show typical vegetation and shrub control techniques. (Popkin-Arizona)

ELEVATION AND TEMPERATURE EFFEC ON SEVERITY OF MAIZE DWARF MOSA VIRUS IN SORGHUM,
Arizona Univ., Tucson. Coll. of Agriculture.
R. B. Hine, W. E. Osborne, and R. E. Dennis.
Progressive Agriculture in Arizona, Vol 22, N Sept-Oct 1970, p 14-16. 1 fig, 3 tab, 12 ref.

Descriptors: *Elevation, *Air temperatu *Viruses, *Sorghum, Irrigated land, Parasiti Plant diseases, Johnsongrass, Arizona, Arid lan Environmental effects, Temperature, Resistan Crop production, On-site investigations, C response, Moisture.
Identifiers: *Maize Dwarf Mosaic Virus (MD *Irrigated crops, *Disease severity, *Crop los *Hybrids, Aphic vector populations, Coch County (Arizona).

Sorghum is one of Arizona's most important rigated crops. During 1968 and 1969, 200,000 rigated acres were grown at elevations from n sea level to over 5,000 feet, equally divi between the southeastern and central parts of state. Full season hybrids, planted at high ele tions in May and harvested in October a November, exceeded 6,000 pounds per acre-abo the state average of 4,400 pounds. Sorghum grown without serious parasitic diseases until Maize Dwarf Mosaic (MDM) virus epidemic 1968 extended to all producing counties. Seri losses were caused only at elevations over 4,0 feet in 1968 and 1969. MDM outbreak in Coch County in 1968 was related to high aphid vec populations, Johnsongrass prevalence, unusua cool summer and large acreages planted susceptible hybrids. This paper explains differen in disease severity at different elevations and tim Several replicated field plots established in areas various elevations were evaluated in sorghu response to MDM. High summer temperatures a use of resistent hybrids reduced disease severity the 1969 field studies. Observations from 1967 1970 show low air temperatures related to serio disease development in susceptible hybrids. MD was serious only aboe 4,000 feet only during t cool 1968 summer, though MDM was common low elevations during this period. Aphid and Joh songrass control is expensive and difficult. Te perature is uncontrollable and unpredictab Hybrid choice, controlled by the grower, is t means of MDM control. Figures and tables sh field test results, temperature comparisons a elevation temperature relationships. (Popki Arizona)

ATE AND OVERGRAZING ON THE TO PLATEAU, ARIZONA,
a Univ., Edmonton.
Campbell.
sional Geographer, Vol 22, No 3, p 132-141, 970. 5 fig, 3 tab, 30 ref.

ptors: *Grazing, *Arid lands, *Climatology, tation effects, *Arizona, Arroyos, Precipita- Atmospheric), Vegetation establishment, Cli- data, History, Environmental effects, Ecolo- heep, Temperature, Indian reservations, ochronology, Erosion, Drought, Biological unities, Sagebrush, Grasses, Shrubs, Plant ations, Canyons, Gully erosion, Topography, ll disposition, Elevation, Ecosystems, Carry- capacity, Variability, Data collections, al, Livestock, Soil erosion.
iers: *Shonto Plateau (Arizona), *Vegeta- nes, Plant pests, Russian Thistle.

honto Plateau area of northern Arizona un- es wide annual temperature variations but has ng grazing potential because of a double- um annual precipitation pattern. Due to a y-old grazing history and a record of climatic patterns in the middle and late 19th century the 1930's, the area may lend clues to the ol- roblem of the Southwest--the nature of the of overgrazing and climatic change on na- egetation and arroyo-cutting. The Bureau of Affairs, which administers the area, has sized the them of overgrazing-vegetation- ction-soil erosion without giving considera- climatic variability. The area is now covered re stands of Russian thistle (Salsola kali), documentary evidence indicates did not ap- ntil the 1920's in any high numbers. Probably originally encouraged by favorable moisture ions, and when overgrazing and aridity cy- ombined to reduce competition from native s, it became dominant. Many gully existent in 930's no longer exist or are stablized. Ap- y, overgrazing has not resulted in accelerated erosion. Some climatic factor, possibly er rain intensity, is probably presently un- ble for gully formation. (Casey-Arizona)

fiers: *Salt River Valley (Arizona), *Salt Project, *Groundwater Act (Arizona), s.

ater resources of the Eastern Salt River Val- Arizona have been intensively developed, ing in the conversion of unproductive desert ensive croplands. However, this vast develop- was sustained by large scale groundwater awals and in the past 30 years the water level eclined from 100 feet to approximately 475 elow the surface, although some gravity water is now available from the Salt River Project and no new irrigation wells have been drilled in critical areas since the Groundwater Act of 1948. Farms in the area obtain water from different sources with varying costs and accordingly, grow differing crops. The 3 crop-water source classes are: (1) irrigation districts supplied by both well and gravity water at an average cost of 10 dollars/acre-foot growing small grains and forage crops; (2) irrigation districts supplying pumped water with high initial cost citrus orchards and grapes which provide high cash returns and (3) privately owned and operated wells where water costs run as high as 15 dollars/acre-foot, growing cotton and potatoes. As water costs increase, more farmers turn to higher value crops. Probably the marginal areas will be abandoned as water costs become too great to produce cotton and potato crops economically. NEW APPROACHES TO IRRIGATED FARMING IN THE SUDAN: ORGANIZATION AND MANAGEMENT,
Leeds Univ. (England). Dept. of Agricultural Economics.
I. G. Simpson.
Land Economics, Vol 46, No 3, p 287-296, August 1970. 2 tab, 3 ref.

Descriptors: *Crop production, *Social impact, *Economic efficiency, *Irrigation systems, *Land tenure, Land use, Land management, Social aspects, Economic feasibility, Farm units, Foreign countries, Administrative agencies, Administrative costs, Irrigation water, Arid lands, Manpower, Political aspects, Cooperatives, Leases, Pumping, Water costs, Rent, Cotton, Planning, Irrigation districts.
Identifiers: *Sudan, *Developing countries, Nile River, Gezira System.

The principal irrigated areas of the Sudan lie along the Blue and White Nile Rivers, and several new projects are currently in the planning stages. The oldest irrigation scheme is the gravity-fed Gezira of about 2 million acres, which was established by the British in 1913. The social and political organization of land tenancy, land development and water provision became an amalgam of state control and private enterprise known as the 'Gezira System'. Tenants are allocated holdings of a fixed number of acres and the holding rights are inheritable. To facilitate mechanized operations and close supervision, the holdings consist of a number of strips in separate fields which were originally only cotton fields. The management of the scheme is highly centralized, and uniform regulations for cropping decisions, land management practices, etc., are not determined at the local level. This results in administrative cost efficiencies, but introduces little progress because of inertia through lack of incentives to individual tenants, conservative decision-making and lack of emphasis on technical leadership. Innovation and flexibility are therefore lacking. Further, population numbers have increased faster than holdings, creating a downward pressure on sizes of individual holdings. In early days of the scheme, the communal system was successful, but the author feels it has outlived it's usefulness. A careful analysis here should furnish guidelines for the organization of future water project schemes. (Casey-Arizona)

Identifiers: *Tunisia, *Developing countries, *Mejerda River, *Agricultural development, Grapes, Olives.

Although it is a major sector of the Tunisian economy, farming is overburdened by technological immaturity and population pressures. Most of the country is arid, and even the narrow, humid coastal band is subject to periodic droughts. The Mejerda River drainage basin represents 60% of the nation's total irrigation potential, but because of unfavorable terrain, only the upper and lower parts of the Mejerda Valley are suitable for agricultural redevelopment. Because of physical and social factors, development efforts have differed in the 2 areas. Owing to its proximity to the rapidly expanding Tunis area, the lower valley, has lost much water to the Greater Tunis water system. Saline water and saline soils are critical problems limiting crop potential. Agrarian reform has resulted in the evolution of private ownership, and a large number of cooperative village settlements have been built. While the irrigated area of the upper valley will not be as great, it may be more productive. The available surface water of the northern Mejerda tributaries may be supplemented by groundwater resources and large cooperatively owned farms are being developed. The division in administration between the 2 valleys has not abetted coordinated planning of total Mejerda basin development. Further, the uneconomic aspects of a third development, the Oued Nebaana Project, indicate the importance of political as well as economic factors. (Casey-Arizona)

AN ECONOMIC ANALYSIS OF LEVEL BENCH SYSTEMS FOR FORAGE PRODUCTION IN NORTH DAKOTA,
Economic Research Service, Fargo, N. Dak.
Wallace McMartin, Howard J. Haas, and Wayne O. Willis.
Conservation Research Report No 14, USDA, March 1970. 21 p, 6 fig, 11 tab, 23 ref.

Descriptors: *Irrigation practices, Water conservation, Snow management, Alfalfa, Economics, *Cost-benefit analysis, North Dakota, *Forages, Agronomic crops.
Identifiers: *Northern Great Plains, Mandan (N Dak), Level bench systems.

Economic benefits to be gained by constructing a level bench system for growing several field crops in North Dakota are described. Since the Northern Great Plains is a dry area, these level benches would serve to conserve the snow so that it could be added to the available water supply for the crop. At the Northern Great Plains Research Center at Mandan, North Dakota, level bench experiments were conducted with various crops, with various width benches, on various gradients of slopes. This paper reports that financial returns for alfalfa

grown with level benches are considerably increased, while for grass, wheat and corn either small benefits or none at all were found. (Holmes-Rutgers)

THE IMPACT OF AGRICULTURAL CHANGE ON A LOCAL ECONOMY IN THE GREAT PLAINS,
Colorado State Univ., Fort Collins.
Melvin D. Skold, and Arthur J. Greer, Jr.
Colorado State University Experiment Station, Technical Bulletin 106, October 1969. 24 p, 2 fig, 13 tab, 21 ref.

Descriptors: *Planning, *Water management (Applied), *Water conservation, *Economic impact, *Input-output analysis, Resource development, Linear programming, Computer programs, Computer models, Water supply, Irrigation efficiency, Irrigation programs, Consumptive use, Expenditures, Water allocation (Policy), Economic prediction, Estimating, Kansas, Colorado, Great Plains, Model studies, Analytical techniques, Income, Agriculture, Farms.
Identifiers: *Agricultural change, *Great Plains Conservation Program, Semiarid lands.

An input-output local economic model was constructed for a 9-county area in northwestern Kansas and east-central Colorado--a semiarid, groundwater irrigation, agricultural region. Impact of irrigation development on agriculture is analyzed by a recursive linear programming model. Irrigation development produces additional purchases of processing services, capital inputs and retail items. The derived demands for these agricultural services become inputs to the input-output model which estimates irrigation-development impact. The region, the analytical model and model applications are discussed. The Great Plains Conservation Program and irrigation development produced marginal changes in income and additional consumer expenditures in accord with the marginal propensity to consume. Unless regional income change is major, the number of firms and volume of employment will not increase greatly. This analytical techniques may be applied to other areas to analyze resource development and programs and yield useful results. Thirteen tables present input-output data. (Popkin-Arizona)

IRRIGATION AS A FARM GROWTH STRATEGY,
North Dakota State Univ., Fargo. Dept. of Agricultural Economics.
Carl E. Olson, and Joseph H. Paulson.
North Dakota Agricultural Experiment Station, Bulletin 486, October 1969. 11 p, 2 fig, 12 tab, 5 ref.

Descriptors: *Farm management, *Irrigation efficiency, *Water resources development, *Economic efficiency, *Water conservation, Net income, Dry farming, Income analysis, Farm prices, Pasture management, Livestock, Irrigated land, North Dakota, Surveys, Economic impact, Gross income, Variability.
Identifiers: *Economic growth, *Economic survival, *Income stability, Interviews, Questionnaires, Lower Yellowstone Soil Conservation District (North Dakota), Garrison Diversion Project (North Dakota), Semi-arid lands.

Irrigated farming in semiarid regions increases chances of survival and economic growth. This report compares and evaluates organizational and operational strategies of irrigation, livestock and mixed farm-operator groups in North Dakota. The development of Garrison Diversion Project encourages interest in irrigation in the state. The Lower Yellowstone Soil Conservation District with 39,088 irrigable acres, is studied by way of 89 questionnaires to operators and follow-up interviews. Mixed or livestock groups have a greater positive change in net worth and a higher rate of economic growth than the irrigation group. Mixed and livestock groups operated more variable and diversified farms, with similar amounts of irrigated acreage, dry cropland and pasture acreage. Irrigated enterprises on a dryland operation add stability to income and increase the economic growth rate. Figures and tables locate the study area and correlate gross farm income, type and total acreage, and assets for irrigation, livestock and mixed groups. (Popkin-Arizona)

Oklahoma Agricultural Experiment Station, Project 1358: Economic Efficiency in the Allocation of Irrigation Water Over Time. Oklahoma Agricultural Experiment Station, Agricultural Research, Processed Series P-600, January 1969. 74 p, 1 fig, 70 tab, 26 ref.

Descriptors: *Crop production, *Irrigation efficiency, *Economic justification, *Economic prediction, *Oklahoma, Farm management, Cultural control, Cultivation, Irrigable land, Irrigation practices, Water management (Applied), Water requirements, Fertilization, Planting management, Cost allocation, Decision making, Limiting factors, Water allocation (Policy), Water supply, Water demand, Water costs, Water shortage, Economic efficiency, Economic impact, Unit costs, Prices, Leases, Resource development, Return (Monetary), Operating costs, Groundwater, Productivity, Cost benefit analysis, Irrigation systems.
Identifiers: *Resource requirements, Custon rates.

Estimates of costs and returns for groundwater-irrigated crops in 11 southwestern Oklahoma counties are presented. Such estimates of resource requirements, costs and returns provide decision makers with data to allocate efficiently the limited water supply to alternative crops. Seeding rates, fertilization and irrigation levels, crop yields, tillage practices, and custom rates were obtained by interviews with agricultural personnel. Prices were obtained from published sources and retailers. Irrigable soils were divided as loam, clay and sand, then subdivided by productivity level. Of the 769,629 irrigable acres, 202,800 acres were irrigated in 1967 of which 120,140 acres were irrigated by groundwater. Three irrigation levels were considered. Production values of each budget list yield per acre, price per yield unit, and product gross value. Total specified costs include non-labor variable production costs. Costs and return estimates for owner operators may be reduced to tenant operating under a leasing arrangement. Seventy tables present economic data on irrigated production. (Popkin-Arizona)

Anti-Locust Bulletin 48, 1970. 22 p, 21 fig, 12 re

Descriptors: *Insect eggs, *Embryonic gro stage, *Incubation, *Humidity, *Dry *Hatching, *Soil moisture, Water utilization, sects, Moisture, Inhibition, Eggs, Growth sta Sands, Moisture availability, Laboratory tests.
Identifiers: *Red Locust, *Africa, *African mig tory locust.

The development of embryos of the Red Loc and the African Migratory Locust, investigated several experiments, was found to be arrested conditions associated with absence of availa moisture. Eggs could not obtain moisture fr water vapor even in a saturated atmosphere. It w necessary for soil moisture to come in contact w the eggs in order to be absorbed. Eggs incubated moist sand developed to hatching without intern tion. Embryos in eggs subjected to deposition in sand exhibited arrested development until ag placed in moist sand. Hatching hoppers from arrested eggs were smaller than those from non-rested eggs. There were no significant differenc between the two species studied. These studies dicate that moisture availability is an important f tor in controlling locust populations. (Yense Arizona)

ENVIRONMENTAL CONTROL OF COLOR TION IN AN ACRIDID, GASTRIMARGU AFRICANUS (SAUSSURE),
Makerere Univ., Coll., Kampala (Uganda). De of Zoology.
C. H. Fraser Rowell.
Anti-Locust Bulletin 47, 1970, p 1-48. 27 fig, color plates, 70 ref. Makerere College Resear Fund. Grant 259.

Descriptors: *Insects, *Color, *Pigments, *H midity, *Microenvironment, Growth stages, Inhib tion, Biological properties, Drying, Arid land Xerophilic animals, Environmental effects, Lig intensity, Animal populations, Insect control.
Identifiers: *Locusts, *Africa.

Gastrimargus africanus is one of the desert locus of arid Africa, causing severe crop damage when the gregarious stage. The brown forms are gregar ous, migratory, and devastating to crops, while th green forms are solitary, less damaging, and no migratory. Locusts kept in jars with differe background colors changed color to resemble background colors except green. Those placed jars having green backgrounds did not chang color. When the eyes were covered with opaqu laquer, only very slight color changes occurred. was found that by varying humidity and numbers individuals kept together, the appearance of th green-form adult was slightly inhibited by crowdin and drying. The green form was much increased b high humidity, and high humidity with infra-re radiation. Under high humidity adult male produced were 100% green forms. Female nymph at low humidity produced no green forms. Crowd ing and high humidity both caused cumulative e fects of heavy patterning. These findings have pos tive implications for insect control in arid Africa croplands. Eleven color plates illustrate the colo forms. (Yensen-Arizona)

This report summarizes observations that were made during a field trip to Alaska in the spring of 1949. Principal objectives of this phase of the Arctic and Subarctic Airfield Drainage Investigation were (1) to make supplemental on-the-ground observations over a wide range of hydrological phenomena, (2) to note the various forms and effects of icing, (3) to observe springtime runoff from natural watersheds, and (4) to crystallize the findings of activity completed at this time into definite recommendations and point out various aspects where continuation and even expansion of research and study are essential.

APPLYING GRADIENT PROJECTION AND CONJUGATE GRADIENT TO THE OPTIMUM OPERATION OF RESERVOIRS,
Kansas State Univ., Manhattan. Dept. of Industrial Engineering.
E. S. Lee, and S. Waziruddin.
Water Resources Bulletin, Vol 6, No 5, p 713-724, September-October 1970. 12 p, 1 fig, 5 tab, 11 ref.

Descriptors: *Optimization, *Multiple-purpose reservoirs, Dynamic programming, Mathematical models.
Identifiers: *Nonlinear programming, Conjugate gradient, Gradient projection algorithm, Quasilinearization.

The recent versions of nonlinear programming techniques such as the conjugate gradient and gradient projection algorithms were used to obtain optimal operating conditions of a multiple reservoirs system with multiple purposes. The algorithms were compared with other techniques in the literature. The conjugate gradient method incorporated the advantage of both the generalized Newton-Raphson, also known as the quasilinearization technique, and the gradient approach while avoiding their major drawbacks. To illustrate the approach a model with three interconnecting reservoirs was considered and was shown schematically. The water was being used for two purposes: irrigation and recreation. The model formulated was dynamic in nature and the seasonal variation of the model was emphasized. A tabular objective function was solved by the two algorithms using several different sets of initial values. The total number of iterations required by the two different algorithms were compared. All the problems converged to the same optimum point. (Kriss-Cornell)

PROCEEDINGS OF A SEMINAR ON RESERVOIR SYSTEMS ANALYSIS, 4-6 NOVEMBER 1969.
Corps of Engineers, Davis, Calif. Hydrologic Engineering Center.

N.d., 161 p, 48 fig, 11 tab, 12 ref.

Descriptors: *Systems analysis, *Reservoir operation, *Operations research, Project planning, Reservoir sites, United States.

The purpose of this seminar was: to provide statements of specific problems in reservoir systems analysis that face the Corps of Engineers; to describe the solution techniques that are currently implemented; and to discuss the potential development of the technology, particularly the applicability of operations research techniques. The specific studies presented included problems dealing with the Kansas River Basin reservoirs, the Kaskaskia River reservoir system, the Apalachicola River, the Roanoke River, the San Francisco reservoir system, the Northeast water supply, the Columbia Basin projects, the Minnesota River Basin, the Arkansas-White-Red Rivers reservoir system, and the Missouri River Main Stem reservoir system. The cast histories and descriptions of problems presented were considered to be representative of the reservoir system problems that exist throughout the country and of the way various projects are being planned and operated. Administrative problems, personality problems and engineering problems were mentioned throughout the seminar. Present methods and future improvements were two of the main topics included in the presentations. (Kriss-Cornell)

AN APPROACH TO FINDING RESERVOIR RULES FOR POWER OPTIMIZATION,
Water Resources Engineers, Inc, Walnut Creek, Calif.
G. K. Young.
Proceedings of the 8th Annual Environmental and Water Resources Engineering Conference, Vanderbilt University, Nashville, Tennessee, June 5-6, 1969, Technical Report no 20, p 87-98. 12 p, 3 fig, 8 ref.

Descriptors: *Dynamic programming, *Optimization, *Power system operations, *Reservoir operations, Economics, Computer programs, Hydroelectric power, Costs, Time, Hydrology.

A forward-looking dynamic program was presented which solved water resource system water allocation over time among systems elements. The computations proceeded forward in time, manipulating economic information, then backtracked through intermediate results to derive optimal physical data. The economic functions were constructed so that dollar values were estimated for every possible distribution of water throughout the system elements. Computer time and memory requirements were given. A hypothetical power optimization was discussed to show the type of problem which was amenable to dynamic programming analysis. Daily flows could be studied over a year's time for a self-contained hydropower system which occasionally purchased outside power to satisfy contractual demands. The approach could be used to identify the costs of constraints. Multiple solutions and the use of penalty functions were suggested means of implementation. Operating rules were inferred by taking the results of dynamic programming calculations, which were optimal system state values over time, and merging the data with given hydrologic data. This data set had hydrologic inflows and other side information matched, time period by time period, with optimal inter-system reservoir releases and transfers. An inference step could be implemented using least squares regression to give the decision rules with reservoir releases as dependent and hydrologic variables as independent variables. (Kriss-Cornell)

1969 RESERVOIR LAND USE SURVEYS: FIELD REPORT AND PROCEDURAL MANUAL,
North Carolina Univ., Chapel Hill. Inst. for Research in Social Science.
Raymond J. Burby.
Research Memorandum, Oct 31, 1969. 10 p, 2 fig, mimeo. OWRR Project B-012-NC (3).

Descriptors: *Reservoir sites, *Land use, *Surveys, *Data collections, Model studies, Aerial photography, Mapping.
Identifiers: *Data coding, Field data.

The procedures utilized to gather land use data in the field, process the data for coding, and coding the data for use in a model developed by the Center for Urban and Regional Studies for reservoir land in various forms of urban and recreational use were described. The three reservoir areas used were Lake Norman in the Charlotte Metropolitan Area,North Carolina; Lake Sidney Lanier in the Atlanta Metropolitan Area; and Lake Boone in the Tri-Cities Metropolitan Area, operated by the TVA. The criteria for recording the extent of land in an urban or recreational use varied with the type of use, i.e., either residential, commercial and industrial, public and institutional, and recreational uses. For field maps of the areas surveyed, aerial photographs and acetate overlays were used. Composite base maps were developed for use in displays and for computing and coding independent variables involving distance measures. A land use classification system was developed to recognize two basic types of land use in reservoir areas: recreation-oriented uses and employment (or urban)-oriented use. The dependent land use data was intended for use in two types of reservoir development forecast models: (1) a reservoir model and (2) a shoreline model. (Kriss-Cornell)

A NONLINEAR MULTIPLE RESERVOIR WATER RESOURCES MODEL WITH MULTIPLE PURPOSES,
Kansas State Univ., Manhattan. Dept. of Industrial Engineering.
E. S. Lee, and S. Waziruddin.
In: Modeling and Optimization of Water Resources Systems, Phase I, Kansas State Univ, Appendix (1970). 15 p, 15 fig, 4 ref.

Descriptors: *Optimization, *Simulation analysis, *Multiple-purpose reservoir, Water resources, Dynamic programming, Stochastic processes, Costs, Model studies.
Identifiers: *Nonlinear programming.

In order to test techniques such as simulation, queueing theory, linear and nonlinear programming techniques, and dynamic programming and also to develop more powerful optimization techniques particularly suited for large water resources systems, a water resources model which included all the important characteristics of a complex large water resources system was developed. This model was a multiple reservoir and multipurpose model. Three different optimization models, namely steady state, dynamic, and stochastic models were presented. A hypothetical reservoir system with four reservoirs and the major tributary systems was used to construct the model. The reservoir was used for five purposes: (1) irrigation, (2) municipal and industrial water supply, (3) hydroelectric power generation, (4) recreation, and (5) flood control. In order to solve the optimization problem, expressions for the various costs and revenues were obtained. Data used to establish the model were from the Jordon Creek area of the Delaware River Basin, the Clearwater River Basin in Idaho and especially the simulation model established by Maass, et al. (See also W71-04043) (Kriss-Cornell)

FLOOD PLAIN INFORMATION, TRUCKEE RIVER, RENO-SPARKS-TRUCKEE MEADOWS, NEVADA.
Corps of Engineers, Sacramento, Calif.

Corps of Engineers Flood Plain Report, October 1970. 63 p, 36 fig, 22 plate, 10 tab.

Descriptors: *Floods, *Flood damage, *Flood plains, *Nevada, Regional flood, Flood forecasting, Flood control, Historic flood, Statistical methods.
Identifiers: *Truckee River (Nevada), Standard Project Flood, Intermediate Regional Flood.

Flooding along the Truckee River and several of its tributaries in the Reno-Sparks-Truckee Meadows area, Washoe County, Nevada is described to aid in solving local flood problems and in planning the best utilization of flood-prone lands. Maps, profiles, cross sections, and text material relating the extent of past flooding to floods which might occur in the future are based on available records of rainfall, runoff, historical flood heights and other technical data. The largest flood of record on the Truckee River in the study area occurred on 23 December 1955 with a peak flow of 20,800 cubic feet per second at Reno. That flood caused extensive damage in downtown Reno and in Truckee Meadows. An Intermediate Regional Flood on the Truckee River is one that would have a frequency of occurrence of once in 100 years on the average. Its magnitude was determined from an analysis of streamflow records and computed hydrographs of synthetic floods. These studies show that the peak flow of the Intermediate Regional Flood would be about 18,000 cubic feet per second in Reno. A Standard Project Flood on any of the tributaries in the study area would have peak flows about 20% to 50% larger than the Intermediate Regional Flood. (Woodard-USGS)
W71-04144

FLOOD PLAIN INFORMATION, BURCH CREEK, OGDEN, UTAH.
Corps of Engineers, Sacramento, Calif.

Corps of Engineers Flood Plain Report, November 1970. 31 p, 9 fig, 11 plate, 5 tab.

Descriptors: *Floods, *Flood damage, *Flood plains, *Utah Regional flood, Flood forecasting, Flood control, Statistical methods.
Identifiers: *Burch Creek (Ogden, Utah), Standard project flood, Intermediate regional flood.

Flooding along Burch Creek in the vicinity of Ogden, South Ogden, and Riverdale, Weber County, Utah is described to aid in solving local flood problems and in planning the best utilization of flood-prone lands. Maps, profiles, cross sections, and test material relating the extent of past flooding to floods which might occur in the future are based on available records of rainfall, runoff, historical flood heights and other technical data. Records of floodflows on Burch Creek are non-existent and there are no precipitation stations in the basin. Therefore, basic hydrologic and meteorologic data were developed from records of other stream basins having characteristics similar to those of the Burch Creek basin. These studies show that an Intermediate Regional Flood on Burch Creek would have a peak flow of 1,200 cubic feet per second below Harrison Boulevard and a peak flow of 380 cubic feet per second below Washington Boulevard. A Standard Project Flood would have a peak flow of 1,480 cubic feet per second below Harrison Boulevard and a peak flow of 450 cubic feet per second below Washington Boulevard. (Woodard-USGS)

Descriptors: *Crop production, *Land use, *Regional analysis, *Irrigation systems, *River basins, Economic justification, Social impact, Environmental effects, Rainfall, Floodwater, Flood plains, Flood irrigation, Land resources, Land management, Arid lands, Transportation, Capital, Social values, Social aspects, Dates, Wheat, Pumping, Irrigation practices, Horticulture, Deserts.
Identifiers: *Sudan, *Nile River, *Nomadism, Millet.

A regional land use study was made in the northern Sudan covering a reach of the Nile River from the Sixth Cataract to the village of Abu Hamed, where the Nile begins its great bend southward. Within the study region, 7 types of land utilization were recognized. (1) Settlements-including 600 small villages, primarily local trading centers and 4 larger towns with administrative as well as commercial importance. (2) Horticulture-located mainly in the more southerly regions and consisting mainly of small units growing cash crops for urban markets; irrigation water is lifted from the Nile by counterweighted dipper Persian waterwheel or small, diesel-driven pumps. (3) Major pump schemes-consisting of fairly large pump scheme tenant holdings growing cash crops. (4) Flush cultivation of dura millet with irrigation waters from the Nile during flood stage-a one crop per year agriculture sold locally. (5) Dates and Wheat-the wheat is sown in wet Nile silt after the flood and consumed locally while the date palms are grown on riverbanks and the dates are both consumed locally and sold commercially. (6) Rain cultivation of dura-the only water supply is rainwater and the Nile farmer are discontinuing this practice although it is still the method of grain production throughout the Sudan. (7) Grazed or unused desert-primarily pastoral nomadism. Land is utilized in a particular way throughout this region because of a complex interaction of factors--physical, economic and cultural. ECOLOGICAL SIGNIFICANCE OF ALIEN PLANTS IN CALIFORNIA GRASSLANDS,
California State Div. of Forestry, Sacramento.
L. T. Burcham.
Association of American Geographers, Proceedings, Vol 2, p 36-39, 1970. 1 tab, 2 ref.

Descriptors: *California, *Grasslands, *Ecology, *Biological communities, *Water utilization, Grasses, Plant populations, Environmental effects, Mode of operation, Seeds, Germination, Grazing, Agriculture, Habitats, Soil moisture, Productivity, Plant groupings, Nutrients, Geographical regions, Annual succession, Succession vegetation establishment.
Identifiers: *Annual plants, *Perennial plants, *Adaptability, *Alien plants.

Approximately 12 million acres of California now under cultivation or occupied by urban or industrial areas, were originally predominate grasslands. Those remaining grassland areas are generally subjected to intensive grazing and have undergone major alterations. Most striking is the almost complete replacement of native perennial grasses by alien, Mediterranean-type annual plants. This

has occurred in the past century, largely by unintentional seed introduction, and has been characterized by 4 stages of plant succession, the last of which is well established. Mediterranean-type plants are highly adaptive to a wide range of ecological conditions. The significant adaptations facilitating their establishment in California are their ability to grow well under conditions of low temperatures and high soil moisture; quick, effective germination in response to sporadic rains; rapid growth and early maturity; and prolific production of viable seeds. The chronological sequence of dominance corresponds to the descending scale of annual plant succession, indicating a decline in productivity. Further, those plants lower on the annual succession scale germinate faster than those higher up. Conditions for alien grass establishment are usually brought on by overgrazing. Productivity lowering is a decline both in nutrient levels and palatibility. The changes in plant composition have resulted in ecologically significant shifts in biotic relationships of the plant-animal complex. (Casey-Arizona)

LAW OF SEASHORE, WATERS AND WATERCOURSES OF MAINE AND MASSACHUSETTS,
M. Frankel.
1969. 196 p.

Descriptors: *Massachusetts, *Public rights, *Watercourses (Legal), *Maine, Seashores, Legislation, Governments, Ownership of beds, Legal aspects, Ponds, Rivers, Oceans, Shores, Fishing, Fisheries, Relative rights, Riparian rights, Tidal waters, History, New England, Docks, Boundaries (Property), Estuaries, Bays, Navigation, Navigable waters.

Maine and Massachusetts water law derives from the English common law as modified by the United States Constitution, the colonial ordinances, and subsequent statutes. After discussion of the origin and history of Massachusetts water law, extensive treatment is given property rights in watercourses and the rules governing settlement of boundary disagreements and determination of title to flats and accretions. Navigability of waterways and the legal rights and restrictions resulting from a finding of navigability are explored. The latter portion of the work is devoted to conflicts between state, federal, municipal and private use and control of activities involving watercourses and adjacent property. State regulation predominates, but is restricted by the common law and colonial ordinances. Public and private rights of fishing are discussed in relation to each of the other topics covered. DO CONTOUR TRENCHES REDUCE WET-MANTLE FLOOD PEAKS,
Forest Service (USDA), Ogden, Utah. Intermountain Forest and Range Experiment Station.
Norbert V. DeByle.
USDA Forest Service Research Note INT-108, 1970. 7 p, illus.

Descriptors: *Peak discharge, *Flood protection, *Flood control, *Small watersheds, *Contour furrows, Contours, Terracing, Infiltration, Ponding, Seepage, Soil engineering, Percolation, Storm runoff, Erosion control, Hydrographs, Rainfall-runoff relationships, Precipitation intensity, Frozen soils, Depression storage, Utah.
Identifiers: *Contour trenches, *Wet-mantle floods, *Sierra Nevada.

A description is given of the January-February flood and associated events that took place on the east side of the Sierra Nevada in 1963, especially those occurrences recorded and observed in a small watershed in the flood-sourc area. Some 110 lineal miles of contour trenches in this 16-square mile watershed may have reduced flow during that flood by about 60 acre feet. (DeByle-Forest Service)

INFILTRATION IN CONTOUR TRENCHES IN THE SIERRA NEVADA,
Forest Service (USDA), Ogden, Utah. Intermountain Forest and Range Experiment Station.
Norbert V. DeByle.
USDA Forest Service Research Note INT-115, 1970. 5 p.

Descriptors: *Contour furrows, *Contours, *Terracing, *Infiltration, *Infiltrometers, Ponding, Seepage, Soil texture, Soil engineering, Hydrologic properties, Percolation, Overland flow, Storm runoff, Erosion control, Flash floods, Floods, Utah.
Identifiers: *Contour trenches, *Double-ring infiltrometers.

Infiltration rates for water ponded in the bottoms of contour trenches constructed in the Sierra Nevada were determined by means of double-ring infiltrometers. The average rate in coarse-textured soils derived from granite was 19.5 inches per hour, more than six times the 3-inch-per-hour rate measured in fine-textured soils derived from andesite. These widely differing rates should be considered when designing a trench network. The probable influence of contrasting infiltration rates on water yields is discussed. (DeByle-Forest Service)

OPTIMUM UTILIZATION AND MANAG MENT OF WATER BEARING FORMATIO HYDRAULICALLY CONNECTED TO STRETCH OF THE CONNECTICUT RIVER,
Mass Univ., Amherst. Water Resources Resea Center.
Ward S. Motts.
Available from NTIS as PB-197 118, $3.00 paper copy, $0.95 in microfiche. Project Comp tion Report, Massachusetts Water Resour Research Center, Amherst, December, 1970. 2 11 ref. OWRR Project A-021-MASS (1).

Descriptors: *Aquifers, Hydrogeology, Grou water, *Induced infiltration, *Artificial rechar Recharge, *Groundwater recharge, Subsurfa waters, Infiltration, Urbanization, Massachuse Conjunctive use.

This investigation examined the groundwa resources and groundwater-recharge potential the Greater Springfield Complex--a high-den urban area surrounded by a rural peripheral a that will soon undergo urban development. Hig productive gravel and sand aquifers of glacial o wash underlie parts of the peripheral areas, es cially west of East Mountain and in the towns Granby, Hampden and Wilbraham, Mass. Also buried channel of outwash yields copious grou water supplies which are used by the municipal of South Hadley. This buried channel overlain poorly permeable silt and clay may contain la undeveloped supplies of groundwater in the So Hadley and South Springfield areas. Potential tificial recharge sites occur along areas of glac outwash in the Greater Springfield Complex. P grams could be developed to recharge surfa water into the aquifers during winter and spr and withdraw the groundwater during the hea water demand periods of summer and f Recharge to wells by induced infiltration is possi along some of the tributaries to the Connecti River such as the Chicopee River, Scantic Riv and Great Brook.

riptors: *Optimization, *Mathematical ls, *Groundwater, Time, Natural recharge, ıg, Economic efficiency, Institutional con-ts.

nal allocation of groundwater over time was zed for situations in which institutional con-ts prevent imposition of a criterion based y on economic efficiency. First, an un-cted optimization of groundwater stocks to nize present value of production. Natural rge was a random variable that complicated ecision process. Then, pricing by a central y under a criterion of economic efficiency hown to be a theoretically sound approach technically feasible one. Next, rationing by other than price was dealth with. Water expressed as a function of a conditional deci-ule X (s) was said to be the best alternative to ct pricing policy. In defining the temporal al-on model, the length of the discrete time d was left undefined, yet a period of one year ltiples of years was assumed. Another model on compromise rationing by the central y dealt with actual physical apportionment. inal model for simplified basin control was a and-for-all decision model where the only on variable was the time in the future at the basin is rationed to use only net periodic rge, and until that time groundwater use is un-olled. This situation would arise in absence of tral control agency. (Kriss-Cornell)

ifiers: Tucson Basin.

raditional water-supply planning problem of omic growth was reviewed in terms of con-of management science. The various water-y planning objective functions were all ex-ons which maximized the difference between and losses involved with water development. mization was performed using quadratic pro-ming, Lagrangian multiples, and calculus. An tive function used to express the water supply em in the Tucson Basin, considered gains as revenue to a hypothetical central water-con-gency which sells water to the uses within the The concept of economic demand was used imate the amount of water that municipal, in-al, and agricultural users would purchase at ent prices. Linear demand functions were for-ed. The possible sources of supply considered groundwater from within the basin, ground-from the neighboring Avra Valley Basin, reclaimed waste water and Central Arizona Project water from the Colorado River. Constraints were formulated to allow for limits on water availability for social limits on water prices and for minimal requirements of each user over a specified time period. (Kriss-Cornell)

THE PUMPED WELL,
Colorado Agricultural Experiment Station, Fort Collins.
Robert E. Glover.
Colorado State University Experiment Station, Technical Bulletin 100, September 1968. 23 p, 6 fig, 11 ref.

Descriptors: *Wells, *Pumping, *Water conservation, *Groundwater, *Water management (Applied), Well spacing, Estimating, Evaluation, Withdrawal, Irrigated land, Electric power demand, Water requirements, Water table, Surface-groundwater relationships, Safe yield, Stability, Water supply, Recharge, Storage capacity, Water balance, Transmissivity, Percolation, Drawdown, Consumptive use, Crop production, Precipitation (Atmospheric), Seasonal, Irrigation water, Colorado, Equations.
Identifiers: *Stream depletion, *Intermittent pumping, *Distributed pumping, Arkansas Valley (Colorado), South Platte Valley (Colorado), San Luis Valley (Colorado), Grand Valley (Colorado), High Plains (Colorado).

The charts presented in this bulletin provide a means of estimating the quantitative effect of existing groundwater pumpage and proposed changes in the irrigation areas of Colorado. About 175,295,349 kilowatt hours of electrical power lifted 1,750,000 acre/feet of water in 1966 in Arkansas Valley, South Platte Valley, San Luis Valley, Grand Valley and the High Plains of Colorado. Important questions are the effect of groundwater pumpage on nearby streams and water tables, safe yields, water supply stability, natural and artificial recharge, and storage capacity. Examples of calculating transmissivity, drawdown, stream depletion, intermittent - and distributed-pumping effect, seasonal variations, and sinking-water table are presented. Six graphs and enclosed sketches show drawdown, stream depletion, seasonal variation, and intermittent and distributed pumping. Effects of evaporation, transpiration, and irrigation-water recharge are discussed. Consumptive use and crop demands in terms of precipitation, irrigation supply and percolation loss are considered in order to develop a water budget. (Popkin-Arizona)

NATURE'S LAW AND MAN'S ETHIC,
Army Engineer District, Omaha, Nebr. Design Branch.
Jack E. Kepler.
Water Spectrum, Vol 2, No 4, p 35-42, Winter 1970.

Descriptors: *Environmental engineering, *Water resources development, *Ecology, *Multiple-purpose projects, *Optimum development plans, Economics, Fish management, Wildlife management, Recreation, Aesthetics, Habitat improvement, Environment, Revegetation, Dams, Planning, Colorado, Flood control, Wildlife habitats, Natural resources, Air pollution, Water pollution control, Ecosystems, Missouri River, Nebraska, Landscaping.
Identifiers: U. S. Army Corps of Engineers, Boulder Creek (Colorado), South Platte River Valley (Colorado).

The U. S. Army Engineer Omaha District has realized that ecological consequences of engineering works are now a major social concern. The Omaha District is working through coordination of many state and federal agencies to develop a far-reaching environmental resource program. Disciplines included in the program are: ecology, water resources development, architecture and landscaping, zoology, botany, wildlife management, economics, archaeology, urban planning, education, and aesthetics. Total use of all project areas is carefully planned, including air and water pollution control, re-vegetation and other plantings; reservoir water-level management; flood control; promoting growth of natural vegetation; maintaining and/or providing refuges and/or spawning or nesting areas; creating greenbelts; preserving historical and archaeological sites, and increasing or maintaining scenic values. Water resource planning now requires not only technical engineering competence but also an understanding of ecology and an appreciation for environmental values. (Yensen-Arizona)

Descriptors: *Simulation analysis, Hydrologic models, *Hydrograph analysis, Watershed studies, Storm drains, *Runoff, Texas, *Model studies, Computer models, *Analog models, Computer programs, Urbanization, Flood forecasting.
Identifiers: Waller Creek, Austin (Texas), *Urban hydrology.

An analog computer program was developed to simulate the outflow hydrographs at four locations within the 38th Street Waller Creek urban watershed at Austin, Texas. Actual outflow was gaged at the final outlet of the watershed. This provided a checkpoint for comparing the simulated and observed final outflow hydrographs. The outflow hydrographs for each subzone were obtained by chronologically abstracting interception, infiltration, and depression storage from their precipitation hyetographs. These outflow hydrographs were then routed through Waller Creek channel to obtain the hydrographs at the four desired locations. The advantages of this model are the flexibility in varying the precipitation inputs to each subzone and the ability to obtain the contribution to the final flood hydrograph of each subzone.

AN OVERVIEW OF U.S. DEPARTMENT OF INTERIOR'S ROLE IN SEDIMENT CONTROL,
Federal Water Quality Administration, Washington, D.C. Div. of Applied Science and Technology; and Geological Survey, Washington, D.C.
Allen Cywin, and Ernest L. Hendricks.
In: Proceedings of National Conference on Sediment Control, September 14-16, 1969, Washington, D C, Environmental Planning Paper, Department of Housing and Urban Development, p 34-40, May 1970. 7 p.

Descriptors: *Sedimentation, *Erosion control, *Sediment control, Water pollution, Turbidity, Sediment transport, Streams, Reservoirs, Reservoir silting, Urbanization, Roads, Construction, Air pollution, Dusts.

Objectives of the following organizations within the USDI having programs related to sediment pollution and its control are reviewed: (1) Federal Water Pollution Control Administration, (2) Geological Survey, (3) Bureau of Reclamation, (4) Bureau of Mines, (5) Bureau of Sport Fisheries and Wildlife, (6) Bureau of Outdoor Recreation, (7) Bureau of Land Management, (8) Office of Water Resources Research, and (9) National Park Service. Sediment represents a heavy economic drain in loss of valuable topsoil. It also makes water unfit for use as municipal and industrial sources of supply unless the water undergoes expensive treatment. It also interferes with navigation, destroys esthetic values and injures aquatic life. As a nutrient carrier, it promotes algal growths which degrade water quality and in turn accelerates the aging process of lakes and reservoirs. Utilization of existing techniques and development of new techniques for sediment control that are tailored specifically for use in urban or urbanizing areas are musts if adequate control of sediment problems is to be achieved and these in turn must consider ecology and water quality requirements. (See also W71-04146) (Woodard-USGS)

TECHNOLOGY FOR SEDIMENT CONTROL IN URBAN AREAS,
Agricultural Research Service, Washington, D.C. Sedimentation Lab.
A. R. Robinson.
In: Proceedings of National Conference on Sediment Control, September 14-16, 1969, Washington, D C, Environmental Planning Paper, Department of Housing and Urban Development, p 48-54, May 1970. 7 p, 4 ref.

Descriptors: *Erosion, *Sediments, *Urbanization, *Erosion control, Construction, Sediment transport, Streams, Planning.
Identifiers: *Erosion control measures.

Under urban construction activity, sediment loads of 25,000 to 140,000 tons per square mile have been measured. Erosion and sediment are usually liabilities, and specific efforts to reduce or manage the adverse effects are required for successful or satisfactory development in use of water and related land resources. Reduction of sediment problems requires information and technology on the mechanics of erosion and sedimentation. The physical and chemical properties of soils also are important factors in the control of erosion. There are needs for new knowledge and methods particularly adapted to the situation where large areas are suddenly changed to urban uses. Generally overlooked is the fact that a flowing stream is a dynamic body which has the energy to transport silt and sediment. Unless flowing in a channel that is nonerodible, such as concrete, the stream will attempt to transport sediment up to its energy ability, and may erode or degrade the bed or surface to obtain this material. If it is carrying a load greater than the available energy, then deposition will occur. Therefore it must be considered to be almost a living, viable body and treated as such. Recommended control measures are presented under the following headings: Permanent vegetation; Diversions; Outlet channels; Bench terraces; Waterway stabilization structures; Bank erosion structures; Stream channel construction; Sediment Basins; and Timing of construction. (See also W71-04146) (Woodard-USGS)

THE CONTROL OF EROSION AND SEDIMENT IN HIGHWAY CONSTRUCTION,
Bureau of Public Roads, Washington, D.C.
Lester A. Herr.
In: Proceedings of National Conference on Sediment Control, September 14-16, 1969, Washington, D C, Environmental Planning Paper, Department of Housing and Urban Development, p 41-47, May 1970. 7 p.

Descriptors: *Erosion, *Sediments, *Erosion control, *Construction, *Highways, Sediment transport, Streams, Planning, Design, Flood damage.
Identifiers: Highway maintenance.

This report emphasizes the importance of prudent planning in highway construction to control erosion and sediment problems that deteriorate c natural resources. Erosion and scour of the ban and beds of streams and rivers are problems be during design and construction of our highways a for years after they are built. Rivers change cou and meanders move downstream which make c bridge piers and abutments vulnerable to attack the main current. In some cases, the initial m river bridge becomes ineffective as a waterway. such a case expensive revetment or additio openings must be constructed. Channel chan made downstream from our highway structu cause degradation of streambeds which make fo dations of existing bridges unsafe and have cau failures. Suggestions for approaching these a other related problems are presented. (See a W71-04146) (Woodard-USGS)

Identifiers: *Channel form ratio, *Soil slips.

The geometry of a stream channel is a product many variables. Some are independent, so semidependent and some dependent on the ch nel itself, but all relate ultimately to the broad vironmental parameters of physique, climate a biota. Study of channel geometry adjustment hydrologic fluctuations may be facilitated by spectacular environmental responses owing changing land use and management practic Monroe and Volfe canyons are neighboring, simi watersheds in the San Dimas Experimental Fore Both have 15-45 degree hillslopes which perio cally contribute choking amounts of debris to stream channels. Between 1958-1960, 74 ha. Monroe Canyon sideslopes were converted fr chapparral to grass while all of Volfe Canyon w allowed to revert naturally after a fire. Dur 1958-1963 rainfall was low and Canyon morpho gies were unchanged. By contrast, during stormier 1963-1969 period all areas suffered s slippage and erosion, but Monroe Canyon more than 8 times the debris and sediment from slopes than Volfe Canyon. The root systems of native brush are greater soil stabilizers than gr Cross-sectional surveys of canyon geomorphol established greater changes in Monroe Cany This is ascribed, at least in part, to changes in ch nel stability and stream discharge resulting fr riparian vegetation clearing. ity-of-water data are presented from analysis
mples collected during the summer and winter
seasons of 1969 from three different types of
rsheds in Tucson, Arizona. Continuing expan-
and intensification of urban and metropolitan
lopment in semiarid regions of the Southwest
ed States are adding to the problems as-
ated with water supply and management.
an runoff shows very high values of COD (Chemical Oxygen Demand), even more than that of the secondary sewage treatment plant effluent. In residential and commercial watersheds, this appears to be due to the suspended organic matter. Range of values in such watersheds is from 91 to 347 mg/l. The range observed in runoff from the industrial watershed is considerably higher and wider, 141 to 1693 mg/l. Tests indicate that runoff from domestic or commercial areas can be used for recreational or domestic uses after treatment with alum and adequate chlorination. (Woodard-USGS)

COST OF PATUXENT RIVER QUALITY MONITORING,
Geological Survey, Arlington, Va.
Jon W. Nauman, and Robert L. Cory.
Journal of American Water Works Association, Vol 62, No 12, p 796-798, December 1970. 3 p, 1 tab, 2 ref.

Descriptors: *Monitoring, *Water quality, *Estuaries, *Water pollution effects, Water temperature, Dissolved oxygen, Electrical conductance, Turbidity, Tides, Water levels, Winds, Instrumentation, Costs.
Identifiers: *Patuxent River (Md).

In October 1963, the USGS installed a continuous water-quality data collection system on the Patuxent River Bridge, near Benedict, Md. The system was instrumented to provide background water quality data for correlation with spot samples taken elsewhere in the estuary and with biological studies carried on in the vicinity of the bridge. Recorded parameters included surface and bottom water temperatures, surface DO, conductivity, turbidity, tide stage, wind speed and wind direction. Total installation and maintenance costs were $22,200. Disregarding installation, the greatest cost was $16,200 or $2,700 annually, for routine maintenance, recalibration, and travel. Overall costs for the collection of water quality data averaged $5,000/yr. The cost was $625 per parameter per year, not including data interpretation and processing. (Knapp-USGS)

A CASE STUDY OF MICROORGANIC CONTAMINANTS IN RIVER WATER,
Mellon Inst., Pittsburgh, Pa.; and Virginia State Water Control Board, Richmond.
Robert A. Baker, and Robert Jennings.
Water and Sewage Works, Vol 117, No 12, p 412-416, December 1970. 5 p, 5 fig, 3 tab, 16 ref.

Descriptors: *Water quality, *Taste, *Odor, *Gas chromatography, *Virginia, Analytical techniques, Organic matter, Solutes, Water pollution effects, Water treatment.
Identifiers: Smith River (Va).

Taste and odor problems in the water of the Smith River, Virginia were studied using gas-liquid chromatography. Phenol is not present in the raw water. The fine red precipitate found in these waters, including the plant mixing basin, suggests an alternate mechanism for organic contaminant transport other than as dissolved solute. The particulates may serve as condensation nuclei for organic materials. Changes in river flow rate alter the scouring velocity for critically-sized particles. These solids then carry along organic materials which in that particular volume occur at concentrations in excess of their discharge or formation rates. (Knapp-USGS)

STUDY OF MOLYBDENUM IN PUBLIC WATER SUPPLY,
Denver Board of Water Commissioners, Colo.
Clair G. Farnsworth.
Water and Sewage Works, Vol 117, No 12, p 418-421, December 1970. 4 p, 1 map, 2 tab, 16 ref.

Descriptors: *Water pollution sources, *Water pollution effects, *Molybdenum, *Colorado, Toxicity, Public health, Water treatment, Water quality.
Identifiers: *Denver (Colo).

Denver, Colorado uses a water supply with a molybdenum content of over 15 micrograms per liter. While molybdenum is much less toxic in general than other metals, such as arsenic, selenium, chromium, and lead, it is suggested that suitable protection should be taken to insure against any large amount of a water-soluble compound of molybdenum entering public water systems. There have been no reports of toxicity due to this molybdenum content of drinking water. Intake of molybdenum is about 0.00003% of average body weight, well within presently accepted tolerable limits. (Knapp-USGS)

THE BACKGROUND CONCENTRATIONS OF COPPER, LEAD, AND ZINC IN STREAMS OF THE 'NEW LEAD BELT', MISSOURI,
Missouri Univ., Rolla. Dept. of Geology.
Nicholas Howard Tibbs.
M Sc Thesis, Missouri University at Rolla, 1969. 77 p, 19 fig, 1 plate, 3 tab, 38 ref, 6 append. OWRR Project B-021-MO (1).

Descriptors: *Water quality, *Water analysis, *Surface waters, *Water pollution sources, Water chemistry, *Missouri, Streams, Chemical analysis, Spectroscopy, Copper, Natural streams, Geochemistry, Data collections, Geology, Mining.

Identifiers: *New Lead Belt (Missouri), Lead, Zinc.

The New Lead Belt of southeast Missouri, predicted to be one of the largest lead deposits in the world, extends from just west of Ellington, on a due north line to Viburnum. At present this area is one of sparse population and relative wilderness, with rugged hills and swift, crystal-clear streams. It was anticipated that the lead mining activity will stimulate a sharp increase in industrial activity in the future in this area. Here then was a potential 'before-after' study in pollution. It was presumed that this intense mining activity could cause significant contamination in the stream waters by the heavy metals- notably copper, lead, and zinc, the primary ore metals. Analytical methods for these metals were developed for atomic absorption spectroscopy. The data obtained from these analyses were arranged in histograms and critically analyzed. The background concentrations were established to be 4-6 ppb (parts per billion) for all three elements. Methods are presented for identifying both short term and long term contamination by using the data distributions. The data distributions were not useful for geochemical prospecting under the geological conditions studied. (Woodard-USGS)

ARTIFICIAL SUBSTRATE SAMPLING, MACROINVERTEBRATES IN A POLLUTED REACH OF THE KLAMATH RIVER, OREGON,
Federal Water Quality Administration, Cincinnati, Ohio. Analytical Quality Control Lab.
William T. Mason, Jr., J. B. Anderson, R. Douglas Kreis, and William C. Johnson.
Journal Water Pollution Control Federation, Vol 42, No 8, Part 2, p R315-R328, August 1970. 6 fig, 4 tab, 7 ref.

Descriptors: *Water quality, *Bioindicators, *Municipal wastes, *Water pollution, Dissolved oxygen, Hydrogen ion concentration, Water temperature, Return flow, Midges, Mayflies, Caddisflies, Dragonflies, Oligochaetes, Clams, Snails, Larvae, Sampling, Nutrients, Farm wastes, Water pollution effects, Path of pollutants, Oregon.
Identifiers: *Klamath River, Lost River, Damsel flies, Leeches, Beetles, Moths, Scud, Sowbugs, Flatworms, Bryozoa, Hydras, Sponges, Artificial substrates.

In 1964 the Federal Water Quality Administration (FWQA) initiated the Klamath basin study to determine the effects on water quality of agricultural wastes in irrigation return water on the Klamath and Lost Rivers. As part of the study, macroinvertebrates were collected at monthly intervals to determine the effects of irrigation return water and pollution from the city of Klamath Falls on the aquatic life. During 1965 and 1966, artificial substrates were installed at five locations in a 30 mile reach of the Klamath River, Oregon. The samples were collected on artificial substrates held in wire baskets which were suspended not more than 48 inches or less than 18 inches below the water surface. The organisms collected were divided into two categories, pollution associated and facultative. The macroinvertebrates collected at various locations and for different times of the year are enumerated in tables. In addition, the percentage of facultative and pollution associated organisms at the various sampling stations are shown. The water temperature, dissolved oxygen, and pH at the various locations is also given. The number of macroinvertebrates collected in the Klamath River during the summer of 1965 and 1966 ranged from a minimum of 44 collected in September 1965 to a maximum of 7,120 collected in July 1965. 84 taxa representing 15 orders were identified from samples collected each month at each station during 1965. The most prevalent organisms in the samples during 1965 and 1966 were those which are found in marginal zones of pollution: Chironomid larvae, oligochaetes, amphipods, isopods, odonates, leeches, and gastropods. reille River, Snake River, Spokane River, Wilmette River, Yakima River, Carbamate compounds.

his report summarizes the results of five annual noptic surveys (1964-1968) for chlorinated ydrocarbon pesticides in surface water of the nited States. The analytical methods employed ere based upon standard methods established by WQA which are specific for dieldrin, endrin, DT, DDE, DDD, aldrin, heptachlor, heptachlor xpoxide, lindane, BHC, gamma-chlordane and chnical chlordane. In the 1967 and 1968 surveys, mples were also analyzed for methyl parathion, arathion, fenthion, ethion, malathion, and ithion. The results showed wide-spread occurnce of the pesticides throughout the United tates. The number of occurrences reached a peak 1966 and then declined sharply in 1967 and 968. The maximum concentrations have not exeeded permissible limits as they relate to human take directly from a domestic water supply. However, they have often exceeded the environmental mit recommended by the Federal Committee on Vater Quality Criteria. Maps and tables are included to show the distribution of the various pestides throughout the United States. (Little-Battlle)

ETHOD SELECTION STUDY 1: A COMARISON OF THREE MODIFICATIONS OF HE SINGLE REAGENT METHOD FOR SOLULE ORTHOPHOSPHATE,
ederal Water Pollution Control Administration, incinnati, Ohio. Analytical Quality Control Lab.
hn A. Winter, and Robert L. Booth.
vailable from: EPA WQO, Analytical Quality ontrol Laboratory, 1014 Broadway, Cincinnati, hio 45202. April 1969. 40 p, 5 fig, 11 tab, 5 ref.

Descriptors: *Phosphates, *Water analysis, Fresh water, Sea water, Sewage effluents, Surface water, Statistical methods, Iron.
Identifiers: *Orthophosphates, *Chemical recovery, *FWQA methods, Distilled water, Chemical interference.

A round-robin test was conducted by the Analytical Quality Control (AQC) Laboratory on three modifications of the mixed reagent method of analysis for soluble orthophosphate for the purpose of establishing an FWPCA interim official method. The tests were conducted on spiked distilled water samples, spiked and unspiked river water, spiked and unspiked sea water, and, in one case, sewage effluent. Based on the data, which are included in graphs and tables, the method of Murphy and Riley gave the best precision and accuracy and the least bias and therefore was selected as the FWPCA interim official method. (Little-Battelle)

ANALYTICAL INSTRUMENTS IN WATER POLLUTION CONTROL,
Federal Water Pollution Control Administration, Cincinnati, Ohio. Analytical Quality Control Lab.
Dwight G. Ballinger.
Analysis Instrumentation, Vol 7, p 242-246, May 1969. 10 ref.

Descriptors: *Laboratory equipment, *Chemical analysis, *Automation, *Instrumentation, Gas chromatography, Spectrophotometry, Volumetric analysis.
Identifiers: Atomic absorption spectrophotometer, Infrared spectrophotometer, Total carbon analyzer, Ion meters, Auto analyzer, Automatic titrators.

The application of various types of instruments to water analysis is reviewed. The instruments reviewed are the gas chromatograph which is used for the determination of trace organic contaminants including pesticides and herbicides, the atomic absorption spectrophotometer which is used for determination of metals in water, total carbon analyzers which are used for determining organic carbon content of water samples, ion meters which are used for determination of cyanide, fluoride, nitrate, chloride, sulfide, calcium and dissolved oxygen, and the infrared spectrophotometer which is used for identification of organic pollutants. Consideration is also given to the Technicon AutoAnayzer and automatic titrators which have contributed to the automation and speedup of routine analyses. Further improvements in instrumentation are needed to extend the parameters that are covered and to further reduce the amount of manual labor involved in analyzing samples. (Little-Battelle)
W71-04205

PERIPHYTON BIOMASS-CHLOROPHYLL RATIO AS AN INDEX OF WATER QUALITY,
Federal Water Pollution Control Administration, Cincinnati, Ohio. Analytical Quality Control Lab.
Cornelius I. Weber, and Ben H. McFarland.
Available from: EPA WQO, Analytical Quality Control Laboratory, 1014 Broadway, Cincinnati, Ohio 45202. March 1969. 19 p, 8 tab, 20 ref.

Descriptors: *Water quality, *Bioindicators, *Chlorophyll, *Ohio River, *Analytical techniques, Biomass, Water pollution, Algae, Periphyton, Phosphorus, Hydrogen ion concentration, Alkalinity, Hardness (Water), Chlorides, Organic matter, Carbon, Water pollution effects, Bacteria, Periphyton, Ohio.
Identifiers: *Autotrophic Index, Chlorophyll a, Shayler Run, Organic carbon, Cincinnati (Ohio).

A review was made of the literature regarding the relationship of biomass and chlorophyll as a first step in determining the potential use of the biomass-chlorophyll ratio as an index of water quality. Laboratory studies were then begun in 1967 on samples taken at two stations above and below the major waste outfall in the Ohio River at Cincinnati. In 1968, samples taken by the FWPCA Newtown Fish Toxicology Laboratory from a small creek (Shayler Run) were included in the study. Since chlorophyll a is the only form of chlorophyll found in all algae, the biomass-chlorophyll which is termed the autotrophic index should be based exclusively on this pigment. The Autotrophic Indices for the samples taken at the two Ohio River stations were significantly different. The data obtained at the upstream station were similar to those from Shayler Run, and indicated a predominantly autotrophic periphyton. In contrast to the upstream station, the high indices at the station below the waste outfall suggested a 'consumer-type' community. The Autotrophic Index shows considerable promise as a tool in water quality studies. Data on water chemistry, Autotrophic Indices, composition of periphyton, and test methods are included. (Little-Battelle)

THE PRESERVATION OF PHYTOPLANKTON GRAB SAMPLES,
Federal Water Pollution Control Administration, Cincinnati, Ohio.
Cornelius I. Weber.
Transactions of the American Microscopical Society, Vol 87, No 1, p 70-81, 1968. 8 fig, 2 tab, 24 ref.

Descriptors: *Photoplankton, *Algicides, *Bactericides, Scenedesmus, Bioassay, Analytical techniques.
Identifiers: *Formalin, *Sample preservation, *Mercuric chloride, *Merthiolate, Cyclotella meneghiniana, Iodine.

The bactericidal and algicidal properties of formalin, mercuric chloride, and Merthiolate were tested using grab riverwater samples and cultures of Scenedesmus bijuga and Cyclotella meneghiniana. Formalin was bactericidal in grab samples at a concentration of 1.0%, and arrested algal growth at a concentration of 0.01% to 0.1%. Mercuric chloride was bactericidal and algicidal at 13-27 mg per liter. Merthiolate arrested algal growth at 1 mg per liter when accompanied by an equal concentration of iodine. Although not bactericidal at concentrations as high as 1 gm per liter, Merthiolate when used in combination with iodine satisfactorily stabilized algal counts in stored samples and was superior to formalin and mercuric chloride in preserving the morphology and color of the algae. The effects of formalin, mercuric chloride, and Merthiolate on bacterial count and algal growth rate are presented. (McCann-Battelle)
W71-04207

PHYTOPLANKTON, SESTON, AND DISSOLVED ORGANIC CARBON IN THE LITTLE MIAMI RIVER AT CINCINNATI, OHIO,
Federal Water Pollution Control Administration, Cincinnati, Ohio.
Cornelius I. Weber, and Donald R. Moore.
Limnology and Oceanography, Vol 12, No 2, p 311-318, April 1967. 6 fig, 22 ref.

Descriptors: *Phytoplankton, *Seston, *Diatoms, Carbon, Organic matter, Bioindicators, Water quality, Water temperature, Ohio.
Identifiers: *Organic carbon, Little Miami River, Cyclotella, Melosira, Stephanodiscus, Cincinnati (Ohio).

A yearlong study was made of the phytoplankton, seston, and dissolved organic carbon in a small, hardwater, midwestern stream. The annual cycle of cell counts and volumes followed the cycle in water temperature. The dominant algae were small, euplanktonic, centric diatoms of the genera Cyclotella, Melosira, and Stephanodiscus, which contributed an average of 63% of the cell count and 66% of the cell volume. The seston averaged 15.8% organic matter by ignition. Stream flow and particulate organic matter were positively correlated from December to April, negatively from

May to November. The photoplankton contributed an average of 38% of the particulate organic matter from May to November. The dissolved organic carbon averaged 6.4 mg/liter, and showed no seasonal cycle. (McCann-Battelle)
W71-04209

A DIRECT-READING SPECTROCHEMICAL PROCEDURE FOR THE MEASUREMENT OF NINETEEN MINOR ELEMENTS IN NATURAL WATER,
Robert A. Taft Sanitary Engineering Center, Cincinnati, Ohio. Water Pollution Surveillance System.
John F. Kopp, and Robert C. Kroner.
Applied Spectroscopy, Vol 19, No 5, p 155-159, 1965. 6 tab, 12 ref.

Descriptors: *Trace elements, Spectroscopy, Aluminum, *Arsenic compounds, Boron, Cobalt, Chromium, Copper, Iron, Molybdenum, Manganese, Missouri River, Ohio River, Mississippi River, Water analysis.
Identifiers: *Spectrochemical analysis, Silver, Barium, Beryllium, Cadmium, Nickel, Platinum, *Lead, Strontium, Vanadium, Zinc.

A method employing a direct reading spectrochemical procedure for the quantitative determination of 19 minor elements in water is presented. Silver, aluminum, arsenic, boron, barium, beryllium, cadmium, cobalt, chromium, copper, iron, molybdenum, manganese, nickel, platinum, lead, strontium, vanadium, and zinc are determined in concentrated water samples by the rotating disc-high-voltage spark technique. Using background as the internal standard, concentrations in the order of 0.01 to 100 mg/l in the processed samples are determined in a matter of minutes by converting the 'counts' from a sequential read-out system on a drum calculator. Recoveries of the elements from known solutions varied from 80 to 113 percent at the 90 percent confidence level. Six tables provide detailed data on the 19 trace elements. (McCann-Battelle)
W71-04211

GAS CHROMATOGRAPHIC SEPARATIONS OF MIXED CHLORINATED FUNGICIDES,
California Univ., Davis. Dept. of Environmental Toxicology.
Wendell W. Kilgore, and Earl R. White.
Journal of Chromatographic Science, Vol 8, p 166-168, March 1970. 4 fig, 9 ref.

Descriptors: *Chromatography, *Fungicides, *Chlorinated hydrocarbon pesticides, 2-4-5-T, Analytical methods.
Identifiers: Ionization detector, Botran, Chemagro 2635, Dyrene, HCB, Lanstan, PCNB, PCP, Phygon, Spergon, TCNB, TCP, 2,4,6-T, Methylation.

This study was undertaken to develop a technique suitable for the separation and detection of a mixture of fungicides on a single gas-liquid chromatography (GC) column. The chemicals were detected either as the parent structures or as their methyl ethers. The analyses were performed with: (1) An all-glass isothermal system utilizing an electron capture detector, and (2) An all-metal temperature program system utilizing a flame ionization detector. The results clearly demonstrate that mixtures of chlorinated fungicides (parent structures or derivatives) can be separated by GC as readily as most insecticides and herbicides. Chromatograms are included to show the separation of chlorinated fungicides. (McCann-Battelle)
W71-04213

THE ELECTRON CAPTURE DETECTOR IN THE ANALYSIS OF CHLORINATED HYDROCARBON PESTICIDES IN TISSUES WITH AND WITHOUT CLEAN-UP,
Miami Univ., Coral Gables, Fla. Dept. of Pharmacology.
J. L. Radomski, and Alberto Rey.
Journal of Chromatographic Science, Vol 8, p 108-114, March 1970. 7 fig, 4 tab, 6 ref.

Descriptors: *Chromatography, *Dieldrin, *Lipids, DDT, Heptachlor, Aldrin, Heptachlor epoxide, Gonads, Separation techniques, Analytical methods, Chlorinated hydrocarbon pesticides.
Identifiers: *Sensitivity, *Electron capture detector, DDD, DDE, Lindane, HCH, Blood, Brain, Liver, Kidney, Clean-up, Gas chromatography, Thin layer chromatography.

The procedures are described for the rapid analysis of chlorinated hydrocarbon pesticides in human and animal tissues utilizing the high temperature electron capture detector. The nickel 63 'hidden window' electron capture detector gives superior sensitivity to chlorinated hydrocarbons and is highly stable toward the response losses experienced with other detectors when biological samples are analyzed. The detector is best operated in the pulse mode at 60v, 3 microsec on and 270 microsec off, at 355C, utilizing prepurified nitrogen as carrier gas. Good linearity and high sensitivity are observed. Fat and blood of both humans and animals is optimally analyzed by chromatography of the hydrocarbon extract without the use of clean-up. The analysis of brain, liver, kidney, and gonadal tissue is best carried out utilizing a TLC clean-up step which readily removes the interferences present. Very high sensitivities are obtained using these methods. (McCann-Battelle)
W71-04214

MICRODETERMINATION OF DERIVATIVES OF PHENOLS AND MERCAPTANS BY MEANS OF ELECTRON CAPTURE GAS CHROMATOGRAPHY,
Federal Water Pollution Control Administration, Cincinnati, Ohio. Div. of Pollution Surveillance.
Fred K. Kawahara.
Analytical Chemistry, Vol 40, No 6, p 1009-1010, May 1968. 1 fig, 3 tab, 9 ref.

Descriptors: *Phenols, *Gas chromatography, *Ethers, Analytical methods, Industrial wastes, Ethers, Aldrin.
Identifiers: *Mercaptans, *Electron capture gas chromatography, Thioethers.

Traces of mercaptans and phenols adversely affect the palatability of water. Sensitive and rapid methods are needed for measuring these compounds which constitute a small portion of the complex weak acid fraction. However, a large portion of the weak acid fractions, isolated from the organic materials extracted from river water, is neither phenolic nor mercaptan. Several interesting approaches have been investigated to develop either faster or selective techniques of analysis. A highly selective method is required because of the numerous contaminants in the weak acid fraction. The conversion of phenol and mercaptan to a derivative which can exhibit electron capture response seemed to offer unique advantages for their measurement. Ethers and thioethers, derived from phenols and mercaptans, respectively, with alpha-bromo-2,3,4,5,6-pentafluorotoluene exhibit excellent electron capture response. This property accounts for excellent measurements in the presence of impurities. Only phenols, mercaptans, and acids will react rapidly with the fluoro-organic reagent under the described conditions. Derivatives of phenols and mercaptans are stable in water and are amenable to gas-liquid chromatographic separations. (McCann-Battelle)

5B. Sources of Pollution

THE INCIDENCE AND FORMATION OF MINE DRAINAGE POLLUTION - APPENDIX C TO 'REPORT FOR DEVELOPMENT OF WATER RESOURCES OF APPALACHIA'.
Corps of Engineers, Cincinnati, Ohio. Office of Appalachian Studies.

Corps of Engineers, Office of Appalachian Studies, Report, Vol 18 of 25 Vol, Appendix C, June 1969. 45 p, 10 fig, 2 plate, 1 tab, 22 ref.

Descriptors: *Acid mine water, *Water pollution sources, *Water pollution control, *Water chemistry, *Appalachian Mountain Region, Water resources development, Oxidation, Pyrite, Sulfides, Iron compounds, Iron bacteria, Sulfur bacteria, Planning.
Identifiers: Appalachian redevelopment.

Appendix C is one of nine appendices to the 25-volume series, 'Report for development of water resources in Appalachia,' and furnishes information on mine drainage pollution. Effluent from coal mines is the major source of water pollution in most of the Appalachian region. Pollution results from mineral acidity created when pyritic material, exposed during mining, is oxidized and the products are dissolved and carried into streams and lakes. The acid waters are very corrosive to metal and damage concrete structures; the low pH is harmful to aquatic life, reducing or eliminating fish and otherwise lowering an area's recreational potential. This appendix and its five report attachments discuss chemical complexities in formation of acid mine drainage, identify its extent and intensity, and present measures to correct or better control the problem. Attachment A, an atlas of drainage incidence compiled by FWPCA, is a summary reference. Attachment B is an annotated bibliography of pertinent literature extant in 1967. Attachments C and D briefly analyze factors that contribute to formation of mine pollution. Attachment E surveys control costs for acid mine drainage using various techniques. (See also W71-03873 thru W71-03877) (Lang-USGS)

STREAM POLLUTION BY COAL MINE DRAINAGE IN APPALACHIA.
Federal Water Quality Administration, Cincinnati, Ohio.

Attachment A to Appendix C-The Incidence and Formation of Mine Drainage Pollution, Federal Water Pollution Control Administration Report Vol 18 of 25 Vol on Development of Water Resources in Appalachia, 1967, (Rev 1969). 261 p, 62 fig, 28 tab, 43 ref.

Descriptors: *Acid mine water, *Water pollution sources, *Water pollution control, *Mine drainage, *Water chemistry, *Appalachian Mountain Region, Data collections, Oxidation, Pyrite, Iron compounds, Stream improvement, Planning.
Identifiers: Appalachian redevelopment, Coal mine drainage.

Coal mine drainage pollution is documented for 1 stream basins and the Anthracite area of northeastern Pennsylvania. Coal deposits underlie more than 72,000 sq mi of Appalachia, about 40% of the total area. Effluent from mining is major source of water pollution in most of the Appalachian region. About 10,500 mi of streams are significantly affected by mine drainage pollution, 6,700 mi of these on a continuous basis. The Monongahela, Allegheny and Susquehanna-Delaware River basins of Pennsylvania, West Virginia, and Maryland contain about 68% of the mine drainage acidity in Appalachia, and 43% of the affected miles of stream are in these watersheds. Inactive underground mines contribute 52% of the acid, active underground mines 19%, inactive surface mines 11%

d active surface mines 1%. Refuse piles and coal ocessing plants also contribute. In some places ost of the pollution in a watershed comes from a w sources. While changes have occurred in mine ainage pollution loads (historically), substantial creases have not occurred within the past 25 yr. ater quality data are given in 30 tables. The tential for further pollution from mining is lected by the fact that recoverable reserves of uminous coals in Appalachia are equal to 440 es the 1964 production and seven times the al cumulative production from the start of min- to 1965. REVIEW OF CURRENT RESEARCH ON AL MINE DRAINAGE IN APPALACHIA,
reau of Mines, Pittsburgh, Pa. Area 1 Mineral sources Office.
bert W. Stephan, and Walter C. Lorenz.
tachment B to Appendix C - The Incidence and rmation of Mine Drainage Pollution, Bureau of nes Report, Vol 18 of 25 Vol on Development of ter Resources in Appalachia, 1967. 26 p, 14 ref.

scriptors: *Acid mine water, *Water pollution rces, *Water pollution control, *Reviews, ibliographies, Water chemistry, Oxidation, rite, Iron compounds, Iron bacteria, Sulfur bac- ia.
ntifiers: *Appalachian redevelopment.

e status of current research methods for abate- nt or control of acid mine drainage is reviewed. aluation is made of present day technology for ntrol of the drainage waters. In 1962 about 3.2 lion tons of sulfuric acid was being discharged ually into streams from active and abandoned l mining operations in Appalachia. Such pollu- n degrades the value of the streams for domestic l industrial water use as well as for recreation. ne refuse piles and other operations also oduce acid waters. Work is described for four nonstration projects - one near Elkins, W. Va. l three in Pa. - in which mine sealing, direct iron noval, ozone oxidation, impoundment oxidation, nineralization, flash distillation, and reverse os- sis are methods being tried. Deep well injection mine waters offers limited possibilities for per- nent disposal. A literature review of research is sented in an annotated bibliography. (See also 1-03872) (Lang-USGS)

THE OXIDATION OF PYRITE ASSOCIATED WITH COAL MINES,
Bureau of Mines, Pittsburgh, Pa. Area 1 Mineral Resource Office.
Walter C. Lorenz, and Robert W. Stephen.
Attachment D to Appendix C - The Incidence and Formation of Mine Drainage Pollution, Bureau of Mines Report, Vol 18 of 25 Vol on Development of Water Resources in Appalachia, 1967. 21 p, 100 ref.

Descriptors: *Acid mine water, *Water pollution sources, *Water pollution control, *Reviews, *Bibliographies, Water chemistry, Oxidation, Pyrite, Iron compounds, Iron bacteria, Sulfur bacteria.
Identifiers: *Appalachian redevelopment.

A survey of the literature and current research on the oxidation of pyrite, both chemical and bacterial, is presented to indicate progress in this field. Pyrite oxidizes when it is an anode. Oxidizing potential for pyrite has been described as being between 560 and 860 millivolts. Factors affecting the rates of pyrite oxidation are oxygen concentration, particle size, temperature, moisture, pH (hydrogen-ion concentration) and Eh (electrode potential) of the reaction, and a possible catalyst. Postulated characteristics of the oxidation reaction are based upon chemisorption of oxygen, high oxidation potential, and bacterial catalyst. Iron- and sulfur-oxidizing bacteria increase the rate of oxidation of pyrite. These bacteria oxidize the ferrous ion to the ferric state. Among the promising lines of research are studies of the electrochemical properties, the effects of bacteria, and surface treatment of pyrite. (See also W71-03872) (Knapp-USGS)

SURVEY OF COSTS ON METHODS FOR CONTROL OF ACID MINE DRAINAGE POLLUTION,
Bureau of Mines, Pittsburgh, Pa. Area 1 Mineral Resource Office.
Robert W. Stephan, and Walter C. Lorenz.
Attachment E to Appendix C - The Incidence and Formation of Mine Drainage Pollution, Bureau of Mines Report, Vol 18 of 25 Vol on Development of Water Resources in Appalachia, 1967. 35 p, 8 fig, 21 tab, 21 ref.

Descriptors: *Cost analysis, *Water pollution control, *Appalachian Mountain Region, *Acid mine water, Neutralization, Waste water disposal, Injection wells, Water treatment, Ion exchange, Chemical precipitation.
Identifiers: *Appalachian redevelopment.

This report presents capital investment and operating costs on the various processes and methods available for the abatement of pollution due to acid coal mine water drainage. The abatement measures include neutralization, iron removal, demineralization, and physical disposal by deep well injection. Cost data are presented on the reclamation of land disturbed by surface and strip mining operations. A summary of available data relating the various size plants for treating acid mine water is reported for the various processes for abatement of pollution. The costs of pollution abatement measures as determined in this survey range from less than $0.07/1,000 gal. to $1.13/1,000 gal. of acid mine water treated. (See also W71-03872) (Knapp-USGS)
W71-03877

ECORSE RIVER WATER QUALITY STUDY, MAY-JULY, 1969.
Michigan Water Resources Commission, Lansing. Dept. of Natural Resources.

Department of Natural Resources, August 1969. 41 p, 12 fig, 9 tab, 2 ref.

Descriptors: *Impaired water quality, *Pollutant identification, *Surveys, *Water pollution sources, Benthos, Sludge worms, Biochemical oxygen demand, Cyandphyta, Domestic wastes, On-site data collections, Michigan.
Identifiers: *Combined sewer overflows, *Ecorse River.

A survey was initiated in May 1969 to evaluate the present water quality of the Ecorse River and relate existing conditions to cause. The Ecorse River Basin is located in a densely populated portion of southeastern Michigan. Its natural drainage area of 46 square miles is located entirely in Wayne County and includes portions of the southern Detroit metropolitan area. The North Branch and the South Branch join to form the main stream three-fourths of a mile west of the Detroit River. The studies confirmed that the lower Ecorse River system is in a severely degraded condition. The principal factors causing degradation are storm water overflows which originiate from combined sewer systems. High biochemical oxygen demand of the Benthic sludge, combined with the BOD of suspended materials and algal respiration, caused extermely low dissolved oxygen levels during the survey. The largest source of the BOD is the Benthic sludge and thus represents a continuous drain on the stream's oxygen resources. Biological studies of the plankton community revealed excessive algal densities, 93 percent of which were blue-greens. Benthic samples from the lower reaches contained only pollution tolerant sludgeworms, indicating an environment in an extreme state of degradation. (Poertner)

MINE ACID DRAINAGE AND ASSOCIATED FLOW FLUCTUATIONS,
West Virginia Univ., Morgantown. Dept. of Civil Engineering; and New York State Dept. of Conservation, Syracuse. Div. of Water Resources.
Charles R. Jenkins, and Henry C. Carroll.
In: Proceedings of the West Virginia Academy of Science, 1969, 44th Annual Session held at West Liberty State College, West Virginia, Apr 10-12, 1968, Vol 41, p 286-293, May 1970. 8 p, 9 fig, 1 tab, 5 ref.

Descriptors: *Acid mine water, *West Virginia, *Water pollution sources, Mine drainage, Water analysis, Water quality, Stream gages, Water chemistry, Weirs, Mine acids, Mine wastes, Streamflow, Water yield.
Identifiers: Acid mine drainage.

The Left Fork of Little Sandy Creek basin, between Fellowsville and Tunnelton, West Virginia, was surveyed for the location of mine drainage sources. At least 30 out of a total of 47 potential sources of drainage were found to produce acid at some time during the year. Thin-crested 90 deg weirs installed along with permanent staffs were found to be sufficiently accurate for measuring flow fluctuation from the mines. A flow meter was used in determining the relationship between acid load and flow from a mine. Tests were also run for pH, alkalinity, hardness, sulfates, iron, and aluminum. The acid load or production was found to be directly proportional to flow. Sulfates, iron, and aluminum were found to vary much the same as acidity. Hardness was not closely associated to acidity concentration but generally was reduced at higher flow due to a dilution effect. The pH remained relatively constant and independent of flow. A summation of conditions from individual mines was found to account closely with conditions observed in the receiving stream. (Knapp-USGS)
W71-03938

MOVEMENT OF ALGAL- AND FUNGAL-BOUND RADIOSTRONTUM AS CHELATE COMPLEXES IN A CALCAREOUS SOIL,
Arizona Univ., Tucson.
Wallace H. Fuller, and Michael F. L'Annunziata.
Atomic Energy Commission Contract AT (11-1)-947. Soil Science, Vol 107, No 3, March 1969, p 223-230. 3 tab, 5 fig, 7 ref.

Descriptors: *Chelation, *Strontium radioisotopes, *Algae, *Fungi, *Calcareous soil, Soil water, Soil water movement, Leaching, Arid lands, Depth, Cyanophyta, Chlorophyta, Sierozems, Soil microbiology, Distribution patterns, Soil profiles.
Identifiers: *Radiostrontium, *Algal-bound radiostrontium, *Fungal-bound radiostrontium, *Microbial activity, *Radiostrontium complexes, DTPA, Soil water profile.

This report evaluates the effect of microbial activity on movement of algal- and fungal-bound raiostrontium, the effect of DTPA on Sr super 89 mobility adsorbed by algal and fungal cells in a calcareous soil, and extra-cellular algal excretions as Sr super 89 complexing agents. Leaching with a water-formaldehyde and water solution caused little Sr super 89-bound movement by Aspergillus niger (fungi), Rhisopus arrhizus (fungi), Oscillatoria bijuga (blue-green alga) and Chlorococcum sp. (a green alga) in Mohave sandy loam. Leaching with 0.067 M DTPA solution displaced from 0.2 to 1.6 percent of the algal- and fungal-bound Sr super 89 below a 20-cm soil depth. The Sr super 89 profile distribution remaining in the leached soil contrasted with the DTPA-treated and the water-treated soil columns. Wherever DTPA was added Sr super 89 moved downward, whereas in the water-treated control Sr super 89 remained in the upper 2.5 cm. Negatively charged Sr super 89 complexes formed from excretions of the desert soil alga Anacystis menegh are shown. Tables indicate Sr super 89 movement with respect to algal and fungal tissue, biologically bound Sr super 89 from DTPA treatment and total extractable Sr super 89. Figures are included of exchangeable and fixed Sr super 89 with soil depth for various biological soil treatments, and evidence of Sr super 89 in a cell-free Anacystis medium as negative complexes. MOVEMENT OF AGRICULTURAL POLLUTANTS WITH GROUNDWATER,
Geological Survey, Raleigh, N.C.
Harry E. LeGrand.
In: Agricultural Practices and Water Quality, Iowa State University Press, Ames, 1970, p 303-313. 2 fig, 18 ref.

Descriptors: *Path of pollutants, *Farm wastes, *Water pollution sources, *Groundwater, *Agricultural chemicals, Fertilizers, Pesticides, Nutrients, Soil water, Soils, Seepage, Soil chemistry, Absorption, Soil mechanics, Water quality, Soil properties, Water wells, Water table, Environmental effects, Water chemistry, Infiltration.
Identifiers: *Agricultural pollutants.

The volume of groundwater polluted by plant nutrients, animal wastes, and pesticides appears to be small. Numerous small polluted zones of water occur in the upper part of the zone of saturation. Sufficient safeguards are available to minimize groundwater pollution to the extent that good agricultural practices should not be deterred. The unsaturated zone above the water table attenuates almost all of the foreign bodies that are potential pollutants of the underlying groundwater. Chemical fertilizers, animal wastes, and pesticides vary greatly in their tendency to degrade in ground environments. The following favorable environmental factors tend to reduce the changes of pollution of water from wells and springs: (1) A deep water table, which (a) allows for sorption of pollutants on earth materials, (b) slows subsurface movement of pollutants, and (c) facilitates oxidation or other beneficial 'die-away' effects. (2) Sufficient clay in the path of pollutants so that retention or sorption of pollutants is favorable. (3) A gradient of the water table beneath a waste site away from nearby wells. (4) A great distance between wells and wastes. (Woodard-USGS)

Identifiers: *Artificial substrates, *FWQA methods.

This report is a reprint of a report first published in September 1966. A description is given of a floating sampler that was used to collect periphyton in the Ohio River at Cincinnati. The rate of colonization of glass slides by diatoms was determined, and the periphyton and plankton diatom communities were compared. The periphyton diatoms were dominated by species of nitzschia and navicula, whereas the plankton diatoms consisted largely of species of melosira and cyclotella. Glass slides were also exposed above and below a group of polluted outfalls on the upper Klamath River, Oregon to show how the number of diatoms present served as indicators of water quality. The sampler is shown schematically, and the data regarding the number of periphyton and plankton present in the Ohio and Klamath Rivers, as well as the species, are included in figures and tables. ACCUMULATION OF PHOSPHATES IN WATER,
Agricultural Research Service, Morris, Minn. North Central Soil Conservation Research Center.
Robert F. Holt, Donald R. Timmons, and Joseph J. Latterell.
Journal of Agriculture and Food Chemistry, Vol 18, No 5, p 781-784, 1970. 1 tab, 37 ref.

Descriptors: *Phosphates, *Path of pollutants, *Eutrophication, *Leaching nutrients, Fertilizers, Precipitation (Atmospheric), Runoff, Animal wastes, Surface waters, Soil erosion, Nutrients, Algae, Lake Superior, Water Pollution sources, Minnesota, Washington, Connecticut.
Identifiers: Illinois River, St. Louis River, Black River (Minnesota), Lake Washington (Washington), Linsley Pond (Connecticut), Lake Zoar (Connecticut), Lake Minnetonka (Minnesota), Big Stone Lake (Minnesota), Lake Crystal (Minnesota).

Natural and agricultural sources of phosphorus to surface waters include percipitation, animal wastes, fertilizers, and land runoff. The actual contribution from these sources is shown to be quite low. However, the concentration of phosphorus required to support profuse algal blooms is so low that the limited amounts supplied are sufficient to exceed this requirement. Eroded soil delivers appreciable amounts of phosphorus to surface waters, but the soil materials capacity to sorb phosphorus results in little tendency for release of this source into the water. Bottom sediments appear to be a sink for dissolved orthophosphate that is supplied to surface waters. Leaching of vegetation can supply relatively large amounts of phosphorus to lakes and streams. Deep incorporation of phosphatic fertilizers materially reduces the concentration of phosphorus in runoff waters as compared to shallow incorporation. Phosphorus concentrations in several lakes and streams are shown. (McCann-Battelle)

5C. Effects of Pollution

ACTION OF IRON SALTS IN SOLUTION ON GOLDFISH,
Bureau of Sport Fisheries and Wildlife, Cook, Washington. Western Fish Nutrition Lab.
Laurence M. Ashley.
The Progressive Fish-Culturist, Vol 32, No 2, 1970. 109 p.

Descriptors: Laboratory equipment, Fish physiology, Water pollution effects, *Iron compounds, *Chlorides, *Sulfates, Juvenile fishes.
Identifiers: *Goldfish, Carassius auratus.

Goldfish (Carassius auratus) weighing 13-28 gm. were exposed to ferrous or ferric chlorides or sulfates dissolved in distilled water. Salt content ranged from 5-100 milligrams per liter. Iron salts were most harmful immediately after they were in solution. Gill blockage was most severe at this time, but was reversible. Fish responded similarly to exposure to the four iron salts tested. (Wahtola-Washington)

STUDY OF WATER POLLUTION PROBLEMS WHICH AFFECT FISH AND OTHER AQUATIC FORMS,
Wyoming Game and Fish Research Lab., Laramie.
Douglas L. Mitchum, and Tom D. Moore.
Final Job Completion Report, Research Project Segment, Project No FW-3-R-13, 1966. 32 p, 12 ref, 12 tab, 10 fig.

Descriptors: *Water pollution effects, *Fish, *Mine wastes, Trout, *Aquatic life, *Invertebrates, Toxicity, Periphyton, Plankton, Benthos.
Identifiers: Radiation, *Uranium.

The extent and effect were studied of pollution by uranium mine effluent on fish and other aquatic organisms in the Medicine Bow River and contributing streams. Samples of water, bottom mud, plankton, benthic organisms and aquatic plants were collected. Fish samples were collected only in July. The naturally occurring levels of uranium, in streams included in this study were determined to be about 5 ppb. Uranium concentrations at the various stations affected by the mine effluent ranged between 2,000 ppb and 60 ppb. Data in-

cated that these relatively high uranium levels ly be toxic to trout. The mine effluent did not ap- ar to have any apparent adverse affect on plank- n, periphyton, bottom fauna organisms, and fish ecies other than trout. Accumulated radiation uld not be detected in bones of the fish ecimens collected from the various stations. ndings show that uranium mine pollution existed the Medicine Bow River drainage area and a tentially serious pollution problem existed wnstream from the study area. A MULTI-PHASIC COMPONENT STUDY TO PREDICT STORM WATER POLLUTION FROM URBAN AREAS,
Avco Economic Systems Corp., Washington, D.C.
Jerry C. Cleveland, Ralph H. Ramsey, Paul R. Walters, and Gary L. Miessler.
Available from NTIS as PB-197 169, $3.00 in paper copy, $0.95 in microfiche. Completion Report, 1970. 248 p, 71 tab, 20 fig, 40 ref, 4 append. OWRR Project C-1743 (No. 3164) (1).

Descriptors: *Storm water runoff, *Water pollution control, *Water quality control, *Mathematical models, *Analytical technique, Runoff forecasting, Land use, Soil contamination, Rain water, Erosion control, Watershed management, Environmental sanitation, *Urbanization, Municipal wastes.
Identifiers: Storm water pollution prediction, Urban storm water pollution, Storm water abatement analysis, *Storm water pollution control, Land activity pollution, Urban hydrology, Water pollution analysis, Structural pollution abatement measures, Non-structural abatement management.

The purpose of this study is to provide a procedure to enable prediction of storm water pollution from land activity, precipitation and runoff in an urban areas. The procedures presented in this study will enable the city planner and civil engineer to predict quantitative and qualitative pollution loads resulting from surface storm water runoff to a receiving stream. The study presents ten mathematical models for this purpose and evaluates them by application to several selected demonstration cities. Also presented are criteria for pollution control strategies and for assessment of various structural and non-structural control measures, their general effectiveness and costs. Guidelines are discussed for the use of these procedures and development of an optimal water pollution control plan. The study concludes that: (1) storm water pollution prediction models are feasible but of limited application unless adequate data are available on hydrological, precipitation and runoff characteristics, as well as land activity detail for representative metropolitan areas, and (2) storm water pollution control for most effectiveness should relate to the specific characteristics of an urban area. Maximum economies will derive from pollution abatement measures taken during the early stages of area development.
W71-03917

THE ROLE OF AQUATIC VASCULAR PLANTS IN THE EUTROPHICATION OF SELECTED LAKES IN WASTERN MASSACHUSETTS,
Massachusetts Univ., Amherst. Water Resources Research Center.
P. A. Bentley, and R. B. Livingston.
Available from NTIS as PB-197 115, $3.00 in paper copy, $0.95 in microfiche. Massachusetts Water Resources Research Center, Publication No 11 (1970). 80 p, 6 tab, 31 fig, 9 ref. OWRR Project A-023-MASS (1).

Descriptors: *Eutrophication, Alkalinity, Conductivity, Massachusetts, Lakes, *Aquatic plants, Nutrients, *Trophic level, Plant growth, Water pollution effects.
Identifiers: Plant distribution.

The growth and distribution of the aquatic vascular plants in nine lakes in western Massachusetts were examined in the field for two growing seasons. The objective of the study was to relate the growth and distribution of the vegetation to trophic levels in acid and alkaline lakes. Environmental parameters monitored included pH, total alkalinity, Secchi transparency, temperature, dissolved oxygen and conductivity. Nutrient levels were found by analysis of surface lake waters and plant shoot tissues for nitrogen and phosphorus. No significant correlations were obtained in these analyses. The distribution of the aquatic vegetation was correlated with total alkalinity and conductivity. Three groups of species were noted, those of waters with an alkalinity greater than 40 ppm CaCO3, those of waters with an alkalinity less than 40 ppm CaCO3, and those occurring regardless of alkalinity. Substrate also exerted a strong influence on plant distribution. No plants were found growing below the thermocline in the lakes sampled. Vegetative growth of the aquatic plants generally followed a standard growth curve. The standing crop was correlated with growth form and depth. Standing crops ranged from 0.3 to 420 g/m2 dry wt. Some difficulty was encountered in correlating plant growth with other parameters of trophic level.
W71-03918

INFLUENCE OF TEMPERATURE AND PHOTOPERIOD ON GROWTH, FOOD CONSUMPTION AND FOOD CONVERSION EFFICIENCY OF CHANNEL CATFISH,
Arkansas Univ., Fayetteville. Dept. of Zoology.
R. V. Kilambi, J. Noble, and C. E. Hoffman.
Available from NTIS as PB-197 119, $3.00 in paper copy, $0.95 in microfiche. Preprint, Proceedings of the 24th Annual Conference, S. E. Association of Game and Fish Commission, 1970. 11 p, 4 tab, 4 fig, 12 ref. OWRR Project A-007-ARK (6).

Descriptors: *Photoperiodisms, *Temperature, Growth, *Channel catfish, Food conversion, *Catfishes, Fishes, Fish food organisms.

A total of 275 channel catfish, measuring on the average of 21.4 mm in total length were raised in the laboratory for 120 days under controlled temperatures of 26, 28, and 32 C with 10-hr and 14-hr photoperiods. Data on growth, food consumption, food conversion efficiency, and water quality were collected at 15-day intervals. Analysis of length-weight relationship showed that the experimental conditions had no effect on body shape. The fish under 28C-10L had slow growth in length throughout the study period. Variations in food consumption and food conversion efficiency in 15-day intervals were discussed. Average food consumption and food conversion efficiency for the entire study period were discussed in relation to temperature-photoperiod combinations. The fish at 28 and 32 C consumed more food under 10-hr than under 14-hr light conditions. There was a direct relationship between photoperiod and food conversion efficiency for the fish at all the three temperatures. Based on overall evaluation of growth, food consumption, food conversion efficiency, water quality, and mortalities, it was concluded that the optimum condition for raising channel catfish was at 32 C under a 14-hr photoperiod.

WATER QUALITY - BENTHIC INVERTEBRATE RELATIONSHIPS IN ESTUARIES,
Maine Univ, Walpole, Ira C. Darling Center for Research, Teaching and Service.
David Dean, and Michael A. Mayurkiewicz.
Available from NTIS as PB-197 121, $3.00 in paper copy, $0.95 in microfiche. Project Completion Report, June 1970. 31 p, 11 tab, 9 fig, 11 ref. OWRR Project A-011-ME (5).

Descriptors: *Benthic, Fauna, Benthos, *Estuaries, Fish, Larvae, Maine, Sediments, Water quality, *Larvae, Growth stage, Estuarine environment, *Aquatic environment, Water pollution, Water pollution effects.
Identifiers: Fish growth, Penobscot estuary, Damariscotta estuary, Sheepscot estuary.

This is a study of the relationships between water quality and benethic invertebrates in the Penobscot, Damariscotta and Sheepscot estuaries, representing heavily polluted, moderately polluted and relatively unpolluted conditions, respectively. Preliminary hydrograhic, sedimentary and faunal surveys were conducted to determine comparable areas in each estuary to be analyzed for interaction between level of pollution and invertebrate benthic fauna present. Field studies conducted in each area included an analysis of the qualitative and quantitative distribution of benthic invertebrates, the seasonal composition of the meroplankton, the set-

tlement of larvae and the hydrography of the area. Laboratory studies included: (1) the determination of particle size distribution of sediments and the amount of volatile solids present; (2) the facility with which different indigenous species of benethic invertebrates can be cultured in the laboratory; (3) the temperature, dissolved oxygen and salinity tolerances of larvae and adults; (4) experiments on temperature as a factor influencing the spawning of adults; (5) the influence of different substrates upon larval settlement; (6) the effect of water quality upon survival, reproduction, development and growth of benethic invertebrates.

THE EVALUATION OF ENVIRONMENTAL ALTERATION BY THERMAL LOADING AND ACID POLLUTION IN THE COOLING RESERVOIR OF A STEAM-ELECTRIC STATION,
Missouri Water Resources Research Center, Columbia.
Arthur Witt, Jr., Robert S. Campbell, and James R. Whitley.
Available from NTIS as PB-197 265, $3.00 in paper copy, $0.95 in microfiche. Completion Report, Missouri Water Resources Research Center, August 31, 1970. 99 p, 21 tab, 15 fig, 21 ref, append. OWRR Project A-020-MO (1).

Descriptors: *Thermal pollution, *Acid mine water, *Fish harvest, *Fish reproduction, *Growth rates, *Periphyton, Primary productivity, Limnology, Fish migration, Benthos, Reservoirs, *Heated water, Thermal stratification, Temperature, Bass.
Identifiers: Shad.

Acid water caused low mortiality of fishes only at the point of inflow. Acid water of high specific gravity could be traced within the lake by sulfate levels and conductance until diluted. Thermal stratification occured in the reservoir, but was transitory due to wind action and mixing. Movement of heated water was dependent on wind direction, which was evident by changing patterns of open water during ice cover. A maximum temperature of 34C and minimum of 10C was recorded in an arm of the reservoir that received heated water. Growth rates of young-of-the gizzard shad were not influenced by the heated water. Gizzard shad and largemouth bass concentrated in the heated water during winter and maintained a winter fishery. The heated water affected gonadal development and accelerated the time of spawning of largemouth bass. There was no difference between rates of accrual of Aufwuchs in heated and unheated water in the reservoir.

EFFECTS OF WASTE DISPOSAL INTO MARINE WATERS - A SURVEY OF STUDIES CARRIED OUT IN THE LAST TEN YEARS,
Engineering-Science, Inc., Arcadia, Calif.
Harvey F. Ludwig, and P. N. Storrs.
Water Research, Vol 4, No 11, p 709-720, November 1970. 12 p, 14 ref.

Descriptors: *Water pollution effects, *Sea water, *Reviews, Waste disposal, Eutrophication, Estuaries, Bays, Water pollution control, Water pollution treatment, Publications, Surveys.
Identifiers: Marine outfalls.

Recent studies of the effects of waste discharges on marine waters are reviewed. There is a common pattern in the variations of abundance and species diversity with distance from the outfall. In the immediate vicinity of the outfall inhibition of biological populations is usually observed. This is evidenced by very low values of both abundance and diversity, and it is particularly apparent for fixed or relatively non-mobile organisms. At some distance from the outfall organism abundance may increase greatly to levels significantly above the average for the area. In this region the species diversity will also have increased, although it will still be less than the area average. Finally, at a greater distance from the outfall the levels of both diversity and abundance return to the normal 'background' level. It is inferred that most waste waters, as presently discharged, have a toxic or inhibitory effect in addition to their biostimulatory characteristics. The toxicity of the waste water is controlling in the immediate vicinity of the outfall, but with the reduction of toxicity by dilution, the biostimulatory effects come to the fore permitting the increased organism abundance noted above. Over the past decade a great deal has been learned about effects of waste materials on marine receiving waters. (Knapp-USGS)

EFFECT OF SOLID WASTE DISPOSAL ON GROUNDWATER QUALITY,
California State Dept. of Water Resources, Los Angeles. Southern District.
Jack J. Coe.
Journal of American Water Works Association, Vol 62, No 12, p 776-783, December 1970. 8 p, 9 fig, 5 tab, 12 ref.

Descriptors: *Landfills, *California, *Water pollution sources, Path of pollutants, Water pollution control, Carbon dioxide, Organic matter, Water quality, Groundwater movement, Waste disposal, Biodegradation.
Identifiers: Sanitary landfills.

Municipal solid wastes are produced in California at a rate of about 7 lb/per capita per day. Most of this waste is disposed of in sanitary landfills. Gas movement rates were found to be 0.22 to 0.8 ft per day vertically and 0.24 to 1.4 ft per day horizontally in undisturbed alluvial soils. Groundwater is often imparied by refuse decomposition products whenever water is allowed to pass through the decomposed material in such quantities as to eventually reach the groundwaters of the area. Leachate impairment of groundwater causes temporary increases in organic material and permanent increases in mineral constituents. Impairment is typified by increases in total dissolved solids, total hardness, chloride, and sulfate. Such increases may last several years. Carbon dioxide effects on groundwater are increases in hardness and bicarbonate. Depending on the pH after carbon dioxide adsorption, water may become corrosive. By modifying a site-usually by the construction of a physical barrier-the groundwater can be protected. (Knapp-USGS)

A NEW FRESHWATER CENTRIC DIATOM MICROSIPHONA POTAMOS GEN. ET SP. NOV.,
Federal Water Pollution Control Administration, Cincinnati, Ohio. Analytical Quality Control Lab.
Cornelius I. Weber.
Journal of Phycology, Vol 6, p 149-153, 1970. 3 fig, 2 tab, 13 ref.

Descriptors: *Phytoplankton, *Diatoms, *Bioindicators, *Water quality, Sampling, Water temperature, Dissolved oxygen, Biochemical oxygen demand, Hydrogen ion concentration, Hardness (Water), Phosphorus, Nitrogen, Chlorides, Sulfates, Water pollution, Delaware River, Hudson River, Ohio River, Mississippi River, Missouri River, Columbia River.
Identifiers: *Little Miami River, *Microsiphona potamos, Connecticut River, Susquehanna River, Chattahoochee River, Maumee River, Great Miami River, Scioto River, Wabash River, Illinois River, Arkansas River, Big Sioux River, Red River, Sacramento River, San Joaquin River, Snake River, Sample preservation.

Analysis of weekly surface grab samples taken from the Little Miami River at Water Pollution Surveillance System Station 90 showed the presence of a new centric diatom microsiphona potamos gen. et sp. nov. (family Coscinodiscaceae). The cells are three to four microns in diameter, four to eight microns long, and contain two to several plate-like chromatophores. They occur singly, or are held together in short chains by the old girdle bands and by numerous apiculi that connect the opposing values of adjacent daughter cells. Cell densities in the grab samples ranged from 29 to 20,140 per ml during the period May 18 to December 14, 1966. Total nitrogen and phosphorus concentration over the sampling period averaged 2.3 and 0.46 mg/l, respectively, indicating high levels of available nutrients. The water was also highly alkaline. Microsiphona potamos was not observed until the water temperature reached 18C and was abundant until water temperatures fell below 10C. The same species has been observed in grab samples from rivers throughout the United States, suggesting that it is an important element of the freshwater phytoplankton of the United States. Descriptive features and electron micrographs of the diatom are included as well as data on the temperature DO, BOD, total phosphorus, total nitrogen, chloride, alkalinity, hardness, and sulfate levels. Macroninvertebrate populations in the Ohio River have been sampled since 1963 for water quality monitoring by biologists of the Federal Water Pollution Control Administration from the Division of Pollution Surveillance. Ohio River Basin stations sampled regularly include: Ohio River at Pittsburgh, Pennsylvania; Toronto, Ohio; Addison, Ohio; Huntington, West Virginia; Cincinnati, Ohio; Louisville, Kentucky; Evansville, Indiana; and Cairo, Illinois (a station at Marietta, Ohio was added in 1966); and the Ohio River tributaries, Allegheny River and Monongahela River at Pittsburgh, the Kanawha River at London and Winfield Dam, West Virginia, and the Wabash River at New Harmony, Indiana. In most cases the stations are located upstream from major waste sources at the cities. The data presented are from collections taken in the four-year period from 1963-66. In 1963-64, the primary sampling devices were Ekman and Petersen dredges. In 1965, basket sampler (limestone-filled, artificial substrates) were used to complement the dredge sampling. The macroinvertebrate populations of the Ohio River and the Ohio River tributaries are presented in two tables by organism and by sampling site. (McCann-Battelle)

lentifiers: Clear Lake (Iowa), Illumination, Light nergy, Inorganic carbon.

he oxygen and carbon-24 methods were used to easure photosynthesis in Clear Lake, Iowa during 958 and 1959. Differences in the rates of hotosynthesis at widely separated stations were enerally small. Daily variations in the rate of hotosynthesis were not greater than two-fold. The orrelation between the rate of photosynthesis and he incident illumination was 0.81, and the efficien-y of utilization of incident light energy was 0.72 er cent. The net gain of organic matter at the hytoplankton level during the period May 1 to ovember 1 was equivalent to 3480 pounds of glu-ose per acre. The relationship is shown between hotosynthesis and total incident light energy for lective days from June 3 thru July 17. Daily hotosynthesis curves at one station are given for lective days from April thru July. (McCann-Bat-lle)

quatic invertebrates of a northern brown-water ream of west central Alberta, the Bigoray River, ere studied for 2 years. The stream drains exten-ve muskeg terrain, but the pH of the water is al-ays on the alkaline side; water temperatures are ear 0C for 6 months of the year, and the stream is ompletely ice-covered for 5 months; there is rogressively less flow during the winter months. uring dry winters, water freezes into the sub-rate, causing considerable mortality to riffle-in-abiting insects. The stream supports a large and iverse mayfly (Ephemeroptera) fauna with Lep-tophlebia cupida (Say) and Baetis tricaudatus Dodds accounting for over 50% of the total yearly fauna by numbers and also volume biomass. Life history data are presented for 11 aquatic invertebrates. Compared to faunas of other streams, the Bigoray River has the following pertinent features: (1) a fauna with a restricted emergence period; (2) a short period (5 months) of seasonal succession and a long period (7 months) when the fauna changes very little; (3) various seasonal growth patterns exhibited by individual species, but the fauna as a whole grow most intensely in autumn; (4) a relatively large number of temporary (or summer) may fly species and (5) a winter species fauna having extensive delayed hatching. 5D. Waste Treatment Processes

SPRAY IRRIGATION OF WASTES FROM THE MANUFACTURE OF HARDBOARD,
Masonite Corp., Chicago, Ill.
Ward C. Parsons.
Industrial Waste Conference, 22nd, May 2, 3, 4, 1967, Purdue University, Vol 52, No 3, July 1968, p 602-607. 4 fig.

Descriptors: *Dissolved oxygen, *Biochemical oxygen demand, *Chemical oxygen demand, *Hydrogen ion concentration, *Soil types, *Climatic data, Sprinkler, Irrigation, Sprays, Waste treatment, Soil-water-plant relationships, Waste water treatment.
Identifiers: Spray irrigation, Hardboard, Hexosans, Glucose, Manose, Galactose, Pentosans, Lignin, Organic acids, Hemicellulose degradation products.

There have been many false notions concerning spray irrigation such as likening this process to a gigantic sand filter. Purification of waste by this method is the direct result of two basic natural phenomena; natural biological reduction and adsorption. Experiments were conducted using the waste water effluent from the production of hardboard to determine the feasibility of using this process in the treatment of waste water. There are advantages and disadvantages to using spray irrigation. The advantages of spray irrigation are: (1) it is simple to operate, (2) operating costs are moderate, and (3) it operates well in dry climates and dry weather. However, there are disadvantages, such as: (1) vast acreage is required, (2) knowledge of subsurface conditions is required, (3) rainy weather causes drainage problems, (4) high power costs, (5) possible salt concentrations, and (6) supersaturation. The author cautions the engineers to consider all the parameters involved in spray irrigation prior to selecting this method for treatment of waste. (Ellis-Texas)

WASTE PROBLEMS RELATIVE TO MINING AND MILLING OF MOLYBDENUM,
New Mexico Bureau of Mines and Mineral Resources.
Roshan B. Bhapper, John H. Fair, and John R. Wright.
Industrial Waste Conference, 22nd, May 2, 3, 4, 1967, Purdue University, July 1968, p 575-592. 4 fig, 4 tab.

Descriptors: *Flotation, *Filtration, *Groundwater movement, *Mine wastes, Water pollution sources, Excavation, *Molybdenum, New Mexico, Waste water treatment, Mine drainage, Acid mine water.
Identifiers: *Questa Mine (N Mex), Molybdenite, Cyanide, Complexing Agents, Tailings Pond.

The problem of molybdenum mining and its resultant processes are presented here. A brief resume of the history of the Questa Mine, its geologic setting, mining and milling operations, and the milling chemistry of molybdenum is included. Sportsmen and conservationists became alarmed at observed tailings, frothing of the water, and fish kills as a result of mining and processing. Public opinion became quite strong when it was found that 'cyanide' was used in the process. Studies of line boxes and aquariums indicated the toxicity of the waste. Analysis of the Red River and causes of fish deaths were conducted by Federal agencies. Changes in the milling chemistry helped resolve the problems that the mining industry encountered. DESIGN OF PLUGFLOW POST AERATION BASIN,
Rex Chainbelt Inc., Milwaukee, Wis.
Richard A. Kormanik.
Journal Water Pollution Control Federation, Vol 42, No 11, p 1922-1931, November 1970. 5 fig, 2 ref.

Descriptors: *Mathematical models, *Reareration, *Dissolved oxygen, Mechanical control, Design, Mixing, Diffusion, Aeration, Waste water treatment.
Identifiers: *Post aeration basins, Surface aerators, Final effluent, Plug flow, Aerator spacing, Oxygen transfer coefficient, Diffused aeration, Detention time.

A mathematical design procedure has been developed for use in designing plug flow post-aeration basins. These basins raise the dissolved oxygen level of final effluent from a waste treatment plant up to levels acceptable to the appropriate regulatory agency. The mathematical formulas are derived in a step-by-step approach. The advantage to the mixing basin is that the dissolved oxygen level may be closely controlled, whereas in a flume or spillway device there is no means of control. Studies revealed that when no detectable oxygen utilization rate was present, then detention time ceased to be a controlling parameter in the re-aeration system. (Lowry-Texas)

FLORIDA FIRM USES GAMMA RAYS TO POLISH SEWAGE PLANT EFFLUENT.

Engineering-New-Record, p 24-25, August 13, 1970.

Descriptors: *Sewage treatment, *Gamma rays, *Nuclear energy, *Water reuse, *Tertiary treatment, Chlorine, Virus, Diatomaceous earth, Activated carbon, Cobalt, Detergents, Pesticides, Waste water treatment, Sewage effluents.
Identifiers: Irradiation, Extended aeration package plant.

Energy Systems, Inc. of Melbourne, Florida, has designed, built, and operates a small treatment plant in Palmdale, Florida which uses nuclear irradiation to kill viruses, break down 96% of all detergents, break down some pesticides, kill 100% of fecal coliform, and 99.99% of general coliform. DO is generally around 6 ppm and BOD is less than 15 ppm. This system utilizes an extended aeration package plant followed by six slim rods of cobalt 60 housed in 14x14x9 ft. reinforced concrete structure. Effluent from the irradiator is of such quality that it could be used for irrigation while passing this effluent through a diatomaceous earth filter would meet FWQA standards for discharge into a stream. If the waste is to be recycled the effluent from the diatomaceous earth filter must be passed through carbon filters. There is no detection of radiation emission outside of the building nor is there any trace of radioactivity in the effluent. Some discussion of the cost of installation and operation is also included. (Ellis-Texas)

ANAEROBIC DIGESTION FAILURES,
Bergen County Sewer Authority, Little Ferry, N.J.
Stanley A. Peterson, and Herman R. Zablatzky.
Journal Water Pollution Control Federation, Vol 40, No 4, p 581-585, April 1968. 2 fig, 5 tab, 3 ref.

Descriptors: *Anaerobic digestion, *Alkalinity, Lagoons, Hydrogen ion concentration, Waste water treatment, Sludge, *Sludge digestion, Digestion (Decomposition).
Identifiers: Isolation, *Ammonium alkalinity, Thickeners, Volatile acids, Gas production, Sodium hydroxide, Potassium hydroxide, Calcium oxide, Gas agitation.

Two separate incidents of digester failure are discussed, along with the materials and methods used to help them recover. Parameters of pH, alkalinity, CO2 content, volatile acids content, and gas production were continuously monitored and that data is presented in graphical form. Underconcentration of feed sludge may lead to failure by the depletion of alkaline buffering materials. Over concentration of feed sludge allows buildup of ammonium alkalinity to toxic levels. One of the essentials of good digester maintenance is early diagnosis of problems through close observance of the major parameters. Ideal sludge concentration varies from plant to plant and must be determined by the individual operator. (Lowry-Texas)
W71-03891

PROTOTYPE STUDIES OF COMBINED TREATMENT OF WASTES FROM 22 TANNERIES AND TWO MUNICIPALITIES,
Syracuse Univ., N.Y. Dept. of Civil Engineering.
N. L. Nemerow, and R. Armstrong.
Industrial Waste Conference (22nd), Purdue University, p 593-601, 1968. 5 fig, 2 tab, 2 ref.

Descriptors: *Alkaline water, *Biochemical oxidation demand, *Chromium, *Sulfur compounds, Biological treatment, Screens, Settling basins, Pumps, Filters, Activated sludge, Aeration, Digestion, Waste water treatment, New York.
Identifiers: *Tannery wastes, *Sulfites, Cayadutta Creek, Gloversville (NY), Dortmund settling tanks, Glue manufacturing, Textile dying, Roughing filters, Aeration tanks.

A prototype plant was constructed in 1965 at the existing Gloversville waste water treatment plant to treat the combined waste from tanneries, textile dying plants, and municipalities. These wastes were effectively treated in a two stage biological plant using the activated sludge process preceded by a roughing filter. Biochemical Oxygen Demand reductions were obtained in the range of 80-90 percent, there was no odor problem, and varying the pH did not appear to affect the treatment. Color removal was obtained 100 percent of the time, however, complete color removal was not obtained all the time. Two sets of tests were run, the first without polyelectrolytes, and the second, with polyelectrolytes. Polyelectrolytes enhanced the Biochemical Oxygen Demand removal and suspended solids removal. (Ellis-Texas)

COMPUTER DESIGN OF SEWAGE TREATMENT PLANTS,
Technicomp, Inc., Great Neck, N.Y.
James J. DeGroat, Bruce A. Pomeroy, and Robert E. Hagadorn.
Public Works, Vol 101, No 11, p 51-53, November 1970.

Descriptors: *Sewage treatment, *Computer simulation, *Mathematical models, Design, Automation, Waste treatment, Programming languages, Specifications, Design, Waste water treatment.
Identifiers: Computerized drafting machines, Fortran IV, IBM 1130.

Technicomp Corporation, under contract to the Federal Water Quality Administration, has developed a program which performs all design calculations and specifications not requiring engineering judgement. Size and weight criteria were established, and information on all available equipment fed directly into the program. The program is written in Fortran IV, and especially for the IBM 1130 computer which is common to many consulting engineering offices. Output is from a UDM drafting machine. It includes not only the drawings but all specifications as to wall thicknesses, pipe diameters, flows, valving, and equipment selected. The entire process requires a minimum of 2 weeks time of the sanitary engineering, and the computer programmer. This process presently required, depending on the manpower available, up to a year or more. Detailed cost figures are not available but estimates indicate the process to be substantially cheaper. Also, slight modification would allow applicability to many different process industries. (Lowry-Texas)
W71-03893

MULTI-STAGE BIOLOGICAL PROCESSES FOR WASTE TREATMENT,
Deering Milliken Research Corp., Spartanburg, S.C.; and Clemson Univ., S.C.
Eugene P. Willimon, Jr., and John F. Andrews.
Industrial Waste Conference (22nd), May 2, 3, 4, 1967, Purdue University, Vol L II, No 3, p 645-660, July 1968. 12 fig.

Descriptors: *Waste treatment, *Microorganisms, *Chemical oxygen demand, *Hydrogen ion concentration, Retention, Volatility, Anaerobic bacteria, Anaerobic conditions, Anaerobic digestion, Aerobic conditions, Aerobic treatment, Aeration, Methane, Waste water treatment.
Identifiers: Multi-stage biological processes, *Multi-stage digestion, Removal rate, Retention time, Volatile suspended solids, Volatile acids.

The authors conducted experiments to show the value of using more than one stage of waste treatment. By using a two stage system, the reactions could be separated and optimized independently of each other. One of the examples shown is the removal of nitrogen from wastes as proposed by Wuhrmann. In this process all of the nitrogen compounds are oxidized under aerobic conditions to NO2 and NO3 in the first stage, and under anaerobic conditions in the second stage where the oxides are reduced by denitrifying bacteria to the gaseous products of N2 and N2O which readily separates from the liquid phase of the waste. The study conducted by the authors consisted of two parts: (1) a series of single stage experiments designed to explore the effects of pH and aeration rate on the effluent composition at low retention times; and (2) a series of multi-stage experiments designed to compare a multi-stage system with a single-stage system using pH control in both systems and limited aeration in the first stage of the multi-stage system. Many analytical tests were conducted and the information on the improved Chemical Oxygen Demand reductions and removal rates for the two stage system was typical of the advantages observed for the multi-stage process. The definite effect of pH illustrates the need for closer control over environmental parameters on present and future processes. (Ellis-Texas)

DESIGN CONSTRUCTION AND MAINTENANCE OF WASTE STABILIZATION LAGOONS,
Farmers Home Administration, Champaign, Ill.
David H. Stoltenberg.
Public Works, Vol 101, No 9, p 103-106, September 1970. 4 fig, 3 tab, 17 ref.

Descriptors: *Oxidation lagoons, *Stabilization, *Algae, Aerobic treatment, Bacteria, Municipal wastes, Biochemical oxygen demand, Waste water treatment.
Identifiers: Depth, Slope, *BOD loading, *Waste stabilization.

There are several important factors involved in waste stabilization using lagoons. The fact that oxygen is produced by algae during the day and consumed by algae at night is presented as a critical factor in lagoon design and maintenance. The variance of allowable biochemical oxygen demand loading with geographical location is also discussed. Construction costs are also presented. Estimates range from $11 to $18 per capita for installations serving 1000 people, and from $30 to $36 per capita for installations serving 100 people. Operation and maintenance costs are estimated to be one-fourth, or one-fifth of the cost for conventional waste treatment. (Lowry-Texas)

DESIGN OF ACTIVATED CARBON ADSORPTION BEDS,
Maryland Univ., College Park. Dept. of Civil Engineering.
John T. Cookson, Jr.
Journal Water Pollution Control Federation, Vol 42, No 12, p 2124-2134, December 1970. 7 fig, 1 tab, 10 ref.

Descriptors: *Activated carbon, *Absorption, *Liquid wastes, *Sewage treatment, *Water purification, Tertiary treatment, Solids contact process, Hydrogen ion concentration, Mass transfer, Boundary processes, Boundary layer, Reynold's number, Waste water treatment.
Identifiers: Attachment, *Transport, Langmuir Isotherm, Von Karmon integral relation, Colburn factor, Sherwood Number, Schmidt Number.

Activated carbon beds offer an effective means of removing organics that exist in very low concentrations. In this process, variables of importance are flow rate, bed height, void fraction, available adsorption area per bed volume, bed particle, size, and the past history of the adsorption bed. An evaluation of a mathematical model is conducted. This model utilizes the theory of mass transfer, based on the thin boundary layer solution of the diffusion equation and the adsorption equilibrium distribution of solute between the stationary and moving phases. The validity of the model is examined by studies on the removal of the virus bacteriophage T4 in packed beds of activated carbon. Virus adsorption on activated carbon can be correlated by the Langmuir isotherm and the validity of the adsorption model to predict the capacity and breakthrough concentration is illustrated. Experimental mass transfer coefficients gave excellent correlation with the Reynold's Number as predicted by Pfeffer and Happel's model which extends mass transfer theory to include multiparticle systems. A simplified design procedure is included. (Ellis-Texas)

MINE WASTE WATER PROBLEMS IN EUROPE,
Pennsylvania Dept. of Mines and Mineral Industries, Harrisburg.
David R. Maneval.
Industrial Waste Conference (22nd), May 2, 3, 4, 1967, Purdue University, July 1968, p 608-619. 9 fig.

Descriptors: *Mine acids, *Sedimentation, *Carbon dioxide, *Hydrogen ion concentration, Water pollution, Waste treatment, Watersheds, Filtration coagulants, Coal mine wastes, Water purification, Acidic water, Water pollution control, Waste water treatment.
Identifiers: United Kingdom, Netherlands, West Germany, Belgium, Back flushing, Emscher River Basin (W Ger).

This is an analysis of how Europeans are combatting the water pollution problems caused by mining. Europeans are realizing the need for community effort and are relying increasingly on river basin authorities and river boards. Probably the most interesting method is used in the Emscher River Basin. The Emschergenossenschaft was established in 1004 with the role of regulating the

ying waste waters. It is the only agency of its to provide waste treatment for the entire river . Europeans have found that it is of great im-ance and benefit to conduct a well coordinated arch program in mine drainage and preparation it effluents. Most European countries are ahead e United States in research and the abatement ollution caused by coal processing plants. ral methods of waste treatment are included in article indicating how various European coun- have treated the effluent from mines and aration plants. A COMPREHENSIVE WATER QUALITY CONTROL PROGRAM FOR THE LAS VEGAS WASH DRAINAGE BASIN. PHASE I.
Boyle Engineering, Las Vegas, Nev.; and Cornell, Howland, Hayes, and Merryfield, Las Vegas, Nev.

Report to the Board of Commissioners of Clark County, Nevada, February 1969. 185 p, 25 fig, 45 tab, 90 ref. C 5021.0, 87-0922-00-00.

Descriptors: *Water quality control, *Urbanization, *Water pollution control, *Water resources development, *Waste water treatment, *Planning, Hoover Dam, Colorado River, Nevada.
Identifiers: *Las Vegas Valley, *Lake Mead, Las Vegas Wash.

A long-range water resource management program was developed for optimization of the beneficial uses of the total water resources in the Las Vegas Valley and the protection of these resources for future generations. Phase I discusses the work necessary to isolate and define the overall problem and make recommendations for selection of a management agency to implement the program. The study area includes about 2,200 square miles in the Las Vegas Valley tributary to the Las Vegas Wash into Lake Mead. The following recommendations are made: (1) That Phase II be authorized immediately to expedite the detailed program formulation and enable full activation of initial operational capability by mid-1972; (2) That the Las Vegas Valley Water District be designated as the agency responsible for the management of water resources and water quality control. It is further recommended that this decision be made soon in order to permit the District to initiate constructive discussion with other agencies. Operational and financial decisions may, in that way, be incorporated into the Phase II program; (3) That the Las Vegas Valley Water District Act should be revised to give the District specific authority to collect, treat, and dispose of sewage, waste and storm waters. (See also W71-03902) (Poertner)

A COMPREHENSIVE WATER QUALITY CONTROL PROGRAM FOR THE LAS VEGAS WASH DRAINAGE BASIN.
Boyle Engineering, Las Vegas, Nev.; and Cornell, Howland, Hayes, and Merryfield, Las Vegas, Nev.

Report to the Board of Commissioners of Clark County, Nevada, December 1969. 146 p, 16 fig, 46 tab, 41 ref. C 5021.0, 87-0922-00-00.

Descriptors: *Water quality control, *Tertiary treatment, *Urbanization, *Waste water treatment, *Water pollution control, Hoover Dam, Colorado River, Groundwater recharge, Reservoir evaporation, Hydroelectric power, Irrigation, Desalination, Nevada.
Identifiers: *Las Vegas Valley, *Lake Mead, Las Vegas Wash.

A comprehensive water quality control program is described for the Las Vegas Drainage Basin. A summary of the conclusions and recommendations reached in the Phase I report is included. Volume II presents conclusions and recommendations. A number of possible combinations of treatment and/or disposal techniques to meet the needs of the Las Vegas Valley area have been studied. These include: in-valley irrigation; exportation to five different hydrogeologically isolated areas; combined irrigation and exportation; groundwater recharge; an area-wide collection, treatment and disposal system terminating at the Colorado River below Hoover Dam; and complete treatment to meet effluent standards for Lake Mead disposal. Similarly, a variety of treatment processes were investigated to meet the needs of the various overall alternates. These processes range from no additional treatment through simple filtration to sophisticated desalinization processes. In-depth comparisons were made on four basic alternate plans as follows: (1) Groundwater basin recharge, (2) Exportation to Eldorado and Dry Lake Valleys, (3) Las Vegas Valley waste water collection and treatment system, and (4) Complete treatment. The Las Vegas Valley waste water collection and treatment system is shown to provide the most economical solution to the overall problems of waste water treatment and disposal of any of the alternates studied. This plan envisions collection of secondary effluents and industrial waste waters, tertiary treatment and discharge below Hoover Dam. (See also W71-03901) (Poertner)

SANTEE PROJECT CONTINUES TO SHOW THE WAY,
Santee County Water District, Calif.
E. W. Houser.
Water and Wastes Engineering, May 1970. 5 p, 2 fig.

Descriptors: *Tertiary treatment, *Water reuse, *Municipal wastes, *Sewage treatment, *Waste water treatment, Cities, Urbanization, Reclaimed water, Water shortage, Water conservation, Recreation, Oxidation lagoons, Anaerobic digestion, Electrodialysis, Ion exchange, California.
Identifiers: *Santee County Water District (Calif).

A historical account is given of the Santee County Water District's successful pioneering efforts to solve waste water disposal problems and, at the same time, to make better use of its increasingly expensive water supplies through the development of better water management practices. This approach necessitated the development of a waste water reclamation system capable of returning municipal waste water to a level of quality that made possible reuse for purposes higher than limited irrigation. It was also necessary to break the 'regulation barrier' that had previously limited the use of sewage treatment plant effluents to golf course irrigation and the irrigation of crops not directly consumed by people. A tertiary treatment plant has been placed in service and its effluent is transported to adjacent recreation lakes. The biological process reduces nitrates to gaseous nitrogen through anaerobiosis of the activated sludge. Phosphates are then removed by chemical additions, flocculation, and settling. Alum and lime are the primary chemicals used. The next stage is filtration through dual media filters to produce an effluent with less than 1.0 mg/liter suspended solids. The water is chlorinated before release to the lakes. Future plans are to intercept a portion of the flow, after filtration, for demineralization and passage through deep carbon filters. Half of this flow will then pass through an ion-exchange unit and half through an electrodialysis unit. The total dissolved solids of this effluent will be below that of the raw drinking water supplied to the Santee population. (Poertner)

DEVELOPMENT OF ECONOMICAL METHODS OF BORON REMOVAL FROM IRRIGATION RETURN WATERS,
Aerojet-General Corp., El Monte, Calif.
R. M. Roberts, and L. E. Gressingh.
For sale by the Superintendent of Documents, U. S. Government Printing Office, Washington, D.C. 20402. Price: $1.50. Office of Saline Water Research and Development Progress Report No. 579, July 1970. 115 p, 21 tab, 20 fig, 41 ref, append. OSW Contract 14-01-0001-1775.

Descriptors: *Water reuse, *Irrigation water, *Return flow, Desalination, Boron, Osmosis, *Reverse osmosis, Waste water treatment.
Identifiers: *Boron removal, Irrigation return water.

The objective of this program has been to investigate and develop methods that are economically feasible for reducing to nonphytotoxic levels the boron content of irrigation return waters that have been renovated by reverse osmosis treatment. In consideration of economic and technical factors, only one method among the conventional and novel techniques investigated offers immediate promise of successful application. This method is based on a discovered process modification in which Amberlite XE-243, a commercial (Rohm and Haas Co.) boron complexing resin, is used. A small (3 KGAL/day) system has been designed which will permit the field evaluation of this process in the deboronation of permeate from a reverse osmosis system. (Wheeler-Office of Saline Water)

PREDATOR-PREY RELATIONSHIPS IN A MODEL FOR THE ACTIVATED PROCESS,
Michigan Univ., Ann Arbor. Dept. of Civil Engineering.
Raymond P. Canale.
Biotechnology and Bioengineering, Vol 11, No 5, p 887-907. 9 fig, 25 ref.

Descriptors: *Bacteria, *Protozoa, *Fungi, *Rotifers, Model studies, Waste water treatment, Nutrients, Microorganisms, Activated sludge, Sludge.
Identifiers: *Predator-Prey relationship.

Three differential equations describe the relationships between soluble organic nutrients, bacteria, and protozoa in a continuously fed, stirred tank biological reactor. The system is seen to oscillate widely as differing amounts of each of the three quantities are either synthesized or destroyed. The differential equations were analyzed to characterize the possible types of solutions which could be obtained. A limit cycle solution was obtained for some values of the system parameters. Simplifying assumptions made initially need to be tested by further experimental work. (Lowry-Texas)

BIODEGRADABILITY OF POTENTIAL ORGANIC SUBSTITUTES FOR PHOSPHATES,
Robert A. Taft Sanitary Engineering Center, Cincinnati, Ohio. Cincinnati Water Research Lab.
Robert L. Bunch, and M. B. Ettinger.
Industrial Waste Conference, 22nd, May 2, 3, 4, 1967, Purdue University, Vol 52, No 3, p 393-396, July 1968. 1 fig, 14 ref.

Descriptors: *Algae, *Biodegradation, *Phosphates, *Eutrophication, Nutrients, Nitrogen, Waste water treatment, Phosphorous, Runoff, Domestic wastes, Detergents, Industrial wastes, *Chelation.
Identifiers: Urban runoff.

Eutrophication will be an increasingly important problem in the future as more waters are impounded and reused. Consideration should be given not only to improving methods of nutrient removal from sewage influents, but also to finding acceptable substitutes for phosphates in industrial processes and detergent formulations. Private industry can make a contribution by developing economically practical materials which will be converted into innocuous products at a rate sufficiently rapid to prevent significant accumulation of pollutants. It appears that biodegradable chelating agents may be considered as a partial substitute for phosphates in certain types of detergent formulations. The relationship between the structure of chelating agents and the loss of chelating ability due to biological action remains to be answered. Results on compounds now under study should give a better understanding of the type of chelating compounds that would minimize environmental contamination. So far, only compounds containing only ore nitrogen molecule have show biodegradability. It does not seem desirable to use nonbiodegradable chelating agents that strongly complex heavy metals unless it has been demonstrated that they do not interfere with waste treatment, coagulation, water softening, calcium metabolism of man, or convey metals into the drinking water. ENGINEERING ASPECTS OF SURFACE AERATION DESIGN,
Texas Univ., Austin. Center for Research in Water Resources.
Wesley W. Eckenfelder, and Davis L. Ford.
Industrial Waste Conference, 22nd, May 2, 3, 4, 1967, Purdue University, Vol 52, No 3, p 279-291, July 1968.

Descriptors: *Activated sludge, *Aeration, *Aerated lagoons, *Oxygen requirements, Transfer, Energy dissipation, Extended aeration, Chemical wastes, Waste water treatment, Industrial wastes, Surfactants.
Identifiers: *Gas transfer, *Oxygen transfer, Entrainment, Refinery wastes, Petrochemical wastes, Liquid film coefficient.

In recent years mechanical surface aerators have become increasingly popular for applications in aerated lagoons and the activated sludge process. When developing aeration design and process application there are several factors which must be considered. These are: (a) the oxygenation efficiency under specified aeration conditions, (b) mixing conditions in the aeration basin, and (c) the oxygen transfer in the aeration liquid relative to water. It has been shown that the oxygenation efficiency of surface aeration units varies with the volume of liquid under aeration. The coefficient alpha can be defined as the ratio of the liquid film coefficients of the waste to that of water. R value for alpha must be used in the design of a surface aeration system and present capabilities for experimentally determining this value is very difficult. Unless more specific information on the prototype aeration unit is available, the minimum alpha value computed from the study should be used for conservative design. Basic principles in the design of surface aeration are included with an example problem. (Ellis-Texas)

THE ANAEROBIC FILTER FOR WASTE TREATMENT,
Stanford Univ., Calif. Dept. of Civil Engineering.
James C. Young, and Perry L. McCarty.
Industrial Waste Conference, 22nd, May 2, 3, 4, 1967, Purdue University, Vol 52, No 3, p 559-574, July 1968. 7 fig, 5 tab, 9 ref.

Descriptors: *Filtration, *Anaerobic conditions, *Biodegradation, *Anaerobic bacteria, Microorganisms, Sewage bacteria, Methane, Chemical oxygen demand, Biological treatment, Waste treatment, Waste water treatment.
Identifiers: *Biological solids production, Effluent quality, Anaerobic filter.

Experiments found that low strength soluble wastes can be treated anaerobically by upflow filtering through rocks. Anaerobic microorganisms collect in the void spaces so that the waste comes in contact with a large biological mass causing a high degree of treatment and an effluent essentially free of biological solids. The advantages of this type of filter are: (1) it is usually suited for treatment of soluble wastes, (2) no recycle is nedded, (3) biological solids remain in the filter, therefore there is little sludge wasting and (4) no addition of heat is required. Aeration or other similar methods can e fectively remove any remaining biochemical o ygen demand and sulfides in treated effluer Power requirements for filter operation are almo nonexistant due to the low head loss through t filter although methane produced from the deco position of wastes can be used for power supply this is necessary. Low maintenance of this systen probable and sludge handling and waste dispos are minimized. (Ellis-Texas)

THE EFFECT OF SHORT-TERM TEMPER TURE VARIATIONS ON METHANE PRODU TION,
Texas Univ., Austin. Environmental Health E gineering. Research Lab.
Richard E. Speece, and Jan A. Kem.
Journal Water Pollution Control Federation, V 42, No 11, p 1990-1997, November 1970. 8 fig tab, 9 ref.

Descriptors: *Sludge digestion, *Anaerob digestion, Waste water treatment, Sludg Digestion (Decomposition), *Temperatu *Methane.
Identifiers: Methane production, Volatile acids.

Laboratory experiments were conducted usi acetate fed into a well-digested mesophilic slud and varying the temperature for a period of 15- minutes. This sludge was also tested at 35C a 45C to observe the relative response of acid for ing and methane forming organisms. It was fou that raising the temperature increased the activi of the methane formers and also decreased the i tial amount of volatile acids present. The varying temperatures below 20C resulted in negligi methane production but there was no resultant r tardation of gas production after restoring the te perature to its normal state inside the digester. view is presented of the cost of steel produc-
the water required, and the resultant waste
r treatment. Generally, water consumption in
nodern steel plant varies from 35,000-45,000
ns per ingot on produced. The type of process
ed for production determines the amount of
culation that can be performed which in turn
es variations in the amount of water needed
waste water produced. The water demand has
ssitated construction of a 200 MGD pumping
on. The waste treatment in steel production is
plicated by the fact that integrated steel mills
rally produce seven different types of waste
r that all require different types of treatment.
s Harbor will ultimately require that around
MGD be treated. Although waste treatment in
plants is quite comprehensive, only three
rate waste streams are described in this paper
nuch as these are the facilities completed at
ime. (Lowry-Texas)

The author describes many of the chemical and physical treatment processes available and indicates there is much scientific progress in the field of waste treatment. He also indicates that scientific progress in this field will be tremendous in the last quarter of the 20th Century and very few problems in waste treatment will remain unsolved at the end of the century. Industry is applying considerable effort to modifying their processes so that they may reduce their effluent problems. Reduction of the amount of water needed for rinsing operations, recycle and reuse and using water for dual purposes are a few of the methods currently being used. Although there is much progress in waste treatment and industrial modifications much remains to be done in applying common sense to the reduction of water use and effluent problems at their source. (Lowry-Texas)

WASTE WATER RESULTING FROM THE CONCENTRATION OF LOW GRADE IRON ORE,
Michigan Technological Univ., Houghton. Dept. of Civil Engineering.
George R. Alger, C. Robert Baillod, and Henry S. Santeford.
Water and Sewage Works, Vol 117, No 10, p 359-362, October 1970. 5 fig, 3 tab, 5 ref.

Descriptors: *Iron, *Strip mines, *Re-circulated water, *Mine wastes, Waste dumps, Water purification, Settling basins, Ponding, Sedimentation, Waste water treatment, Impoundments, Tertiary treatment.
Identifiers: Lake Superior, Tailings deltas, Alum-coagulation, Tailings slurries.

The increasing scarcity of high-grade iron ore has necessitated the use of lower grade, or less concentrated ore pockets. This ore must then be concentrated to make it economical to process. The production of one tone of concentrate from four tons of crude ore requires from 600 to 6000 gallons of water, depending upon the method used. The waste water from this process contains 70,000 to 500,000 milligrams per liter of suspended solids, 90% of which settles very rapidly. Direct discharge of this waste water into a receiving stream or lake causes tailings deltas to build up. To prevent this, large impoundment basins are created, which allow the suspended solids to settle before the water gets to the receiving stream. Data shows that these systems must be carefully designed in accordance with prevailing weather conditions, and if so designed they will operate satisfactorily. Problems are most likely to occur during spring thaw, at which time alumcoagulation-sedimentation is used as a tertiary treatment measure. (Lowry-Texas)

ECONOMICS OF THERMAL POLLUTION CONTROL,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
George O. G. Lof, and J. C. Ward.
Journal Water Pollution Control Federation, Vol 42, No 12, p 2102-2116, December 1970. 5 fig, 3 tab, 16 ref.

Descriptors: *Economics, *Water temperature, *Thermal pollution, *Flow, *Cooling towers, Hydroelectric plants, Water cooling, Recirculated water, Specific heat, Cost analysis, Air temperature, Heat ransfer, Interest rate, Water pollution control.
Identifiers: Turbine-generator efficiency.

Approximately 80% of all water used by industry is used for cooling purposes and it has been estimated by the power industry that by 1980 10% of all the freshwater runoff in the U. S. will be used for cooling purposes. The economic consequences of thermal discharge from steam-electric power plants are modest increases in operating costs by the downstream users. Heat discharge prevention by recirculation is discussed. The reasons for recirculation are: (1) insufficient stream flow, (2) economic reasons, and (3) regulation by laws. The cost of cooling water recirculation is composed of: (1) capital costs (installation costs) which are dependent on the water flow required, the prevailing wet bulb temperature, the water temperature change through the tower, and the temperature of water delivery from the cooling tower to the condenser, and (2) operating costs which are dependent on the makeup of the water, chemicals required, and power for fans and pumps. Justification for temperature standards in streams cannot rest solely on the economics of cooling but it also depends on the ecology, aesthetic, and recreational use of the water. (Ellis-Texas)

KINETICS OF FIXED FILM BIOLOGICAL REACTORS,
Clemson Univ., S.C. Dept. of Environmental Systems Engineering.
B. H. Kornegay, and J. F. Andrews.
Industrial Waste Conference, 22nd, May 2, 3, 4, 1967, Purdue University, p 620-630, July 1968. 8 fig, 7 ref.

Descriptors: *Kinetics, *Trickling filters, *Filtration, Waste water treatment, Sewage treatment, Microorganisms, Mathematical models, Biological treatment.
Identifiers: Fixed-film, *Biological reactors, Substrate utilization, Substrate removal rate, Specific growth rate, Film thickness, Annular reactor.

An experiment was conducted in search of a more rational design procedure for trickling filters. Although the equations presented in this paper can not be construed to serve as mathematical approximations of the process of trickling filtration, the basic principles are the same, and the authors did a theoretical investigation of the kinetics of fixed-film, biological kinetics. Results of this experiment indicated that both dissolved oxygen and substrate utilization reached a steady-state value when the biological film thickness reached 70 microns and greater thickness resulted in no increase in the rate of removal. A theoretical substrate removal curve was developed and compared with the observed results of the completely-mixed, fixed-film reactor. This comparison showed: (1) the rate of removal shows a saturation phenomenon and by increasing the substrate concentration the rate of substrate removal approaches a constant value (2) the effluent concentration is dependent on the influent concentration and (3) the validity of the proposed model is supported by the agreement found between the theoretical curve and observed results. BIOLOGICAL CHEMICAL COMBINATION DRAMATICALLY CUTS TREATMENT,
Teck Township (Ontario).
B. Davis, and S. Love.
Water and Pollution Control, p 35-37, May 1969. 3 fig.

Descriptors: *Waste water treatment, *Dissolved oxygen, *Biochemical oxygen demand, *Dissolved solids, Chemical oxygen demand, Hydrogen ion concentration, Coagulation, Chemicals, Aeration, Biodegradation, Sewage treatment.
Identifiers: Kirkland Lake, Ontario, Canada, Cyanide, Jar tests, Suspended solids, Total solids, Contact stabilization.

A very dilute municipal waste was observed and tested in studies conducted in Teck Township, Canada. It was found that the waste was not greatly effected by primary treatment so studies were un-

dertaken to establish the most efficient biological treatment process that would effectively treat the weak sewage. The results of the biodegradability study showed that a source of cyanide caused interference with biological systems and chemical coagulation studies were conducted to determine if this waste could be treated by this means. The chemical treatment resulted in improved BOD and suspended solids removals of 60% and 85%, respectively. It was decided to combine a biological system and chemical treatment. Using this combined treatment and adjusting the chemicals so that an optimum treatment was obtained, the BOD removal was 83% and suspended solids removal was 90%. The BOD of the treated effluent was consistently below 24 mg/l. The cost of the chemicals ranged from 2.0-2.5 cents/1000 gallons while retention time was reduced which would result in a reduction in capital costs. (Ellis-Texas)

SOLIDS SEPARATION BY ULTRAFILTRATION FOR CONCENTRATED ACTIVATED SLUDGE,
Syracuse Univ., N.Y. Bioenvironmental Engineering Div.
Frederick W. Hardt, Lenore S. Clesceri, Nelson L. Nemerow, and Donald R. Washington.
Journal Water Pollution Control Federation, Vol 42, No 12, p 2135-2148, December 1970. 11 fig, 5 tab, 17 ref.

Descriptors: *Filtration, *Activated sludge, Biochemical oxygen demand, Microorganisms, Membranes, Filters, Pressure, Hydrogen ion concentration, Chemical oxygen demand, Phosphorus, Respiration, Gels, Solvents, Solutes, *Waste water treatment.
Identifiers: Mixed liquor, Volatile suspended solids, *Ultrafiltration, Ultrafiltrate flux, Total organic carbon, Cell lysis.

An investigation of the feasibility of separating the suspended material from the mixed liquor and recyling this material back to the biological reactor as a means of treating high-BOD wastes was conducted. This involved passing feedwater at an elevated pressure across synthetic membranes where the larger dissolved solids and suspended material are retained by the membrane and recycled back through the activated sludge plant. Analytical methods included daily monitoring of the COD, total and orthophosphates, TOC, MLVSS, SS, inorganic solids, respiration rate, and the molecular size of the dissolved solids in the mixed liquor and the ultrafiltrate. This process showed a 98% COD reduction but had a gradual accumulation of cell degradation products in the biological reactor. The membranes used detained DS of molecular weights greater than 1000 which essentially removes all bacterial solids from the effluent stream. (Ellis-Texas)

METABOLIC RESPONSE OF ACTIVATED SLUDGE TO SODIUM PENTACHLOROPHENOL,
Oklahoma State Univ., Stillwater. School of Civil Engineering.
J. A. Heidman, D. F. Kincannon, and A. F. Gaudy, Jr.
Industrial Waste Conference, 22nd, May 2, 3, 4, 1967, Purdue University, Vol 52, No 3, p 661-647, July 1968. 8 fig, 1 tab, 13 ref.

Descriptors: *Activated sludge, *Metabolism, Acclimatization, Waste water treatment, Biological treatment, *Sludge treatment, Microorganisms, Chemical oxygen demand, Biochemical oxygen demand.
Identifiers: *Sodium pentachlorophenol, *Chlorinated hydrocarbons, Oxidative phosphorylation, Shock loadings, Oxygen uptake.

The effect of various concentrations of soidum pentachlorophenol (SPCP) on acclimated and non-acclimated sludges was investigated. Studies have shown that an activated sludge system can, with sufficient acclimation, be operated in the presence of SPCP concentrations up to 250 mg/l without serious retardation of biochemical purification efficiency. Biological solids in systems which were acclimated to SPCP were totally dispersed, and did not flocculate or settle during a one-hour settling period. The results obtained add evidence regarding release of metabolic products during the purification process and although SPCP did not exhibit a BOD, it caused glucose to exhibit a higher BOD during the aeration period. Under shock loading conditions it was seen that fairly small does of SPCP caused impairment of system efficiency. (Ellis-Texas)

CHEMICAL EXFOLIATED VERMICULITE FOR REMOVAL OF PHOSPHATE FROM WASTE WATERS,
Grace (W. R.) and Clarksville, Md.
Jacob Block.
Available from NTIS as PB-196 740, $0.95 in microfiche. For sale by the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402. I 67.13/4: 17010 DHK 08/69 Paper Copy $0.50. Water Pollution Control Research Series 17010 DHK 08/69, August, 1969. 41 p, 5 fig, 12 tab, 6 ref. FWQA Program 17010 DHK Contract 14-12-485.

Descriptors: *Phosphates, *Waste water Treatment, *Aluminum, Iron, Effluents, Aluminum alloys, Chemical reactions, *Iron exchange.
Identifiers: *Phosphate Removal, *Vermiculities, Alumina.

The objective of the study was to prepare a chemically treated vermiculite with a high phosphate capacity that could be economically regenerated. Many aluminum vermiculites were prepared and tested for phosphate removal. 10 mg PO4/gram of treated vermiculite was the maximum capacity obtained. Highest phosphate capacities were obtained with materials prepared at relatively low pH (3.0) and dilute aluminum solutions (0.1-0.05M). Experimental results showed hydroxylated aluminum vermiculite is inactive towards phosphate ion. The mole ratio of phosphate adsorbed to exchanged aluminum seemed to approach 0.33, or an exchange capacity of 13.7 mg PO4/gm. The most successful regeneration scheme was one in which a dilute sulfuric acid solution containing a small amount of Al sub 2 (SO sub 4) sub 3 was used as a regenerant. Addition of the Al sub 2 (SO sub 4) sub 3 prevented the loss of aluminum from the vermiculite. No significant differences in capacity were found between thermally and chemically exfoliated vermiculite. Vermiculites containing cations other than Al were also prepared. These included Fe (III), Fe (II), La (III), and Cu (II). None appeared more promising than Al-vermiculite. The adsorption isotherm of aluminum-vermiculite was obtained, and the data were found to fit both the Langmuir and Freundlich plots. (Selby-Texas)

MEMBRANE MATERIALS FOR WASTE WATER RECLAMATION BY REVERSE OSMOSIS,
Gulf General Atomic, San Diego, Calif.
A. S. Douglas, M. Tagami, and C. E. Milstead.
Copy available from Sup Doc as $0.65; microfiche from NTIS as PB-197 448, $0.95. Water Pollution Control Research Series ORD-17040-EFO-06/70, June 1970. 64 p, 22 tab, 6 fig, 17 ref. FWQA Program 17040-EFO.

Descriptors: *Reverse osmosis, Semipermeable membranes, Demineralization, Membrane processes, *Osmosis, Tertiary treatment, *Waste water treatment, Water pollution control, *Water reuse, *Membranes, Sewage effluents.
Identifiers: Asymmetric membranes, Flux, Porous supports, Rejection.

An experimental program was carried out to evaluate potential reverse osmosis membranes for the tertiary treatment of secondary sewage efflue
The evaluation program consisted of both dir
osmosis and reverse osmosis tests on various me
branes using both single solutes and secondary
fluent. The types of membranes tested were pol
rethane latices, cellulose diacetate, cellulose 2
acetate, polyvinyl-pyrrolidone (PVP)-polyi
cyanate interpolymers, and polyelectrolytes. T
cellulose diacetate, polyurethane latices, and P
membranes were not suitable for waste water tre
ment. Although rejection of most solutes by P
membranes was quite good for dense, homoge
ous membranes, high-flux, asymmetric membra
had poor rejection characteristics. Very-high-f
membranes were prepared from polyacrylic a
cast onto cellulose nitrate, cellulose nitrate-cel
lose acetate, and polysulfone porous suppo
While NaCl rejection of over 80% was obtained
fluxes of less than 20 gal/ft sq-day at 600 psi,
creased flux was obtained only at the expense
good rejection. The best combination of high f
and rejection was obtained with asymmetric cel
lose 2.5-acetate membranes heat-treated in wa
at 55 to 70C.

The feasibility of a lagoon treatment-spray irri
tion system for the combined domestic wastes a
industrial waste waters in Muskegon Coun
Michigan, was investigated in this study. The l
gest volume of industrial waste waters are th
discharged by a pulp and paper mill. Vario
aspects of the project were investigated includi
(1) sampling and analyses of waste waters fo
variety of parameters, (2) a review of available
formation concerning the effect of trace eleme
on soils and crops, (3) laboratory tests of
treatability of the combined waste waters by lago
treatment, (4) development of a simulation mo
to assist in analyzing the volume and water qual
aspects of a treated waste water storage lagoon,
soils and groundwater field and office studies
garding the management of groundwater levels
ensure an adequate aerobic treatment zone in
soil as well as to prevent ponding in the site ar
and (6) investigations of certain agricultu
aspects in using treated waste waters as spray
rigation water. The results of this work dem
strated the feasibility of the proposed project bas
on information developed during the study,
highlights of which are: (1) the waste waters do
contain constituents having concentrations th
would interfere with use of these waste waters
agricultural irrigation waters, (2) the treatability
the wastes by the proposed lagoon treatme
system was confirmed by the laboratory work, a
(3) the feasibility of management of the groun
water levels within the irrigation site area
drainage wells and tile was established by the
vestigations. (See also W69-09331)

ifiers: Soda ash.

, limestone, and soda ash were studied as alizing agents for treatment of a ferric iron mine drainage water. Both continuous flow batch tests were used to determine the effec-ess of each of these neutralizing agents in ion with acid mine water. Comparisons made een the three neutralizing agents include: ical costs, reaction efficiencies, effluent water ties, sludge settling rates, sludge volumes, and nt solids of sludges. All three neutralizing s were capable of treating acid mine drainage. costs were half that of limestone for treating ame acid mine drainage because of the low ation of limestone. However, the charac-ics of the limestone sludge were superior to of lime and soda ash sludges. The cost for ash treatment was excessive. Further research proving limestone utilization is under way. No ences in reaction efficiency were found in dry ng or slurry feeding the neutralizing agents. tion during and/or after the limestone reaction ly increased the effluent pH but failed to in-e limestone useage efficiency or improve ef-t quality.

ECONOMIC FEASIBILITY OF SELECTIVE ADJUSTMENT IN USE OF SALVAGEABLE WATERS IN THE TUCSON REGION, ARIZONA,
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
Kenneth James DeCook.
PhD Thesis, University of Arizona, 1970. 216 p, 10 fig, 27 tab, 75 ref. OWRR Project A-020-ARIZ (1).

Descriptors: *Water reuse, Salvage value, Recreation, Irrigation, *Costs, Model studies, Waste water treatment, Sewage treatment, Treatment facilities, Arizona, Water Quality Act.
Identifiers: *Tucson, Santa Cruz River, Pima County.

This thesis anlayzes the economic feasibility of using salvageable water from domestic-industrial effluents, as well as from storm runoffs for recreational, industrial and agricultural purposes in the Tucson area. The author determines the costs associated with the utilization of these waters and the benefits to be derived from each kind of use. He combines these net-benefit coefficients into a simple normative model which can be used for examining specific planning and operational adjustments in the regional salvageable water system. In the Tucson area the author concludes that the demand for water for recreational uses would support the construction of new sewage treatment facilities. (Holmes-Rutgers)

INDUSTRIAL WASTE DESALTING FOR BYPRODUCT RECOVERY,
Office of Saline Water, Washington, D.C.
Eric D. Bovet.
Journal American Water Works Association, Vol 62, No 9, September 1970, p 539-542. 10 tab.

Descriptors: *Demineralization, *Desalination, *Byproducts, Economics, Electro-osmosis, Reverse osmosis, Tertiary treatment, Waste treatment, Waste water treatment, Pollution abatement, Abatement.
Identifiers: *Desalting, *Byproduct recovery, Cheese wastes, Pulp and paper wastes, Iron and steel wastes, Plating and metal finishing wastes, Nuclear wastes, Coal mine wastes.

Desalting of industrial wastes is not a complete solution to the problem of their disposal, but it is of value of reducing the pollutional load on rivers and lakes. Desalting may be economically feasible when a salable byproduct is produced by the process. It has been estimated that a one-time market of $1.5 billion exists for desalting equipment between 1970 and 1990. Industries in which desalting may yield a profitable byproduct include, but are not limited to, the Cheese, Pulp and paper, Iron and steel, Plating and metal finishing, Nuclear power and Coal mining industries. Other large industries in which desalting may be profitable are the chemical and petroleum industries. The time is fast approaching when the profitability of desalting will be secondary to the need for reducing the pollution load on the environment. When this happens the market for desalting equipment will widen greatly. (Hewett-Rutgers)

STREAM QUALITY MODELING BY QUASILINEARIZATION,
Kansas State Univ., Manhattan. Dept. of Industrial Engineering.
E. S. Lee, and Irving Hwang.
In: Modeling and Optimization of Water Resources Systems Phase I, Kansas State Univ, Appendix B4, (1970). 28 p, 2 fig, 8 tab, 6 ref.

Descriptors: *Mathematical modeling, *Stream improvement, *Water quality control, Least squares method, Constraints.
Identifiers: *Quasilinearization, Parameters, Differential equations.

A fairly effective technique for estimating parameters or coefficients in differential equations arising in stream quality modeling was introduced. The parameter estimation problem was treated as a two-point or multipoint boundary-valve problem by the quasilinearization technique. To illustrate the approach, a simple representation of stream quality which included BOD concentration, DO deficit and other physical constraints was considered. First, only three data points were used to estimate the rate constants. Then the case was shown where more than three data points were desirable to obtain and the classical least squares criterion was used so that the sum of the squares of the deviations was minimized. A generalized system of nonlinear differential equations was used to apply the quasilinearization technique and its computational procedure was shown. To test the effectiveness of the approach, given data were obtained numerically by solving two equations. Estimation of two parameters was shown as well as estimation of experimental errors, and estimation of three parameters. It was shown that with very approximate initial guesses for the unknown parameters, only three to five iterations were needed to obtain 4 to 5 digit accuracy. (See also W71-04043) (Kriss-Cornell)

A QUANTITATIVE FRAMEWORK FOR RESIDUALS--ENVIRONMENTAL QUALITY MANAGEMENT,
Resources for the Future, Inc., Washington, D.C.
Clifford S. Russel, and Walter O. Spofford.
In: Natural Resource Systems Models in Decision Making, Water Resources Research Center, Purdue Univ, p 66-86, 1970. 21 p, 4 fig, 1 tab.

Descriptors: *Optimization, *Mathematical models, *Linear programming, Diffusion, Damages, Quality control, Management.
Identifiers: *Non-linear programming, Residuals.

A conceptual framework for a large scale, regional environmental quality management model was discussed. The model was designed first to deal explicitly with the major forms of residuals--airborne, waterborne and solid wastes, and noise. It allowed physical tradeoffs among these in production and treatment. Secondly, it reflected possibilities of substitution within production processes. The model was divided into three parts: (I) a linear inter-industry model; (II) a set of environmental diffusion models; and (III) a set of receptor damage functions. The model aimed at an optimal selection of residual discharge levels from the production activities of a region. The computational procedure

involved non-linear programming techniques. The result of this computation was residual discharge vector. In order to test the quantitative procedure a didactic version of the model using a hypothetical region was used which consisted of a single river, two urban areas--an industrial area and a residential area, and miscellaneous activities. Two economic activities were analyzed: a beet sugar processing plant and a thermal power generating facility. This model could be used to explore solution sensitivity to the parameters of physical models and damage functions. (See also W71-03855) (Kriss-Cornell)

SYSTEM OPTIMIZATION FOR RIVER BASIN WATER QUALITY MANAGEMENT,
Weston (Roy F.), Inc., West Chester, Pa.
Chia Shun Shih.
Journal Water Pollution Control Federation, Vol 42, No 10, p 1792-1804, Oct 1970. 13 p, 7 fig, 9 tab, 11 ref.

Descriptors: *Optimization, *Dynamic programming, *Model studies, *Water quality control, *Water management (Applied), Pollutants, Costs, Waste treatment, River basin.

A dynamic programming model was presented that minimized the total costs to water users and waste dischargers in a basin. The model could also identify direct benefits in terms of reduced treatment costs. The optimization criterion was to minimize total water supply and waste treatment costs and to maximize the direct benefits for the basin subject to regulatory agency constraints. The river basin model included both conservative and nonconservative pollutants in its optimization scheme yet nonconservative pollutant effects were emphasized. The optimization procedure was illustrated by a simplified example. The hypothetical cost functions used in the examples were compiled from past experience and various literature sources; the basic data were generalized for inclusion in the example. In formulating the model a hypothetical river system was developed. The most salient features associated with the application of the model presented were discussed. (Kriss-Cornell)

MATHEMATICAL MODELS AS AN AID IN THE SOLUTION OF WATER POLLUTION CONTROL PROBLEMS,
Water Pollution Research Lab., Stevenage (England).
G. Knowles.
Chemistry and Industry, p 697-701, May 1970. 5 p, 5 fig, 6 ref.

Descriptors: *Mathematical models, *Water pollution control, *Computers, Activated sludge, Nitrification, Esturaries, Biochemical oxygen demand, Dissolved oxygen.

Some recent applications of mathematical models in water pollution control, including a brief discussion of types of computers suitable for such work, were described. First, the design of activated sludge plants to obtain nitrification was dealt with. Due to lack of adequate methods involving population dynamics, such models have not overcome many problems. Research has been conducted though exploring its basic mechanisms. One such mathematical model dealing with minimum period of retention of the waste water in an aeration tank for consistent nitrification was presented. Second, an example of a mathematical model used to aid in the management of estuaries which neglected tidal motion so that the water was regarded as always bein at half tidal level was given. Next, a mathematica model was developed for predicting biochemica oxygen demand values in an estuary and the exam ple used was an estuary on the South Coast of En gland. A model for predicting dissolved oxyge values in an estuary was presented last with an ap plication to the Thames Estuary. General purpos digital computers, analogue computers, and hybri computers were cited as those used for mathemat cal models. (Kriss-Cornell)

A LONG-TERM PLAN FOR SEWERAG DEVELOPMENT IN THE JOHANNESBURG RE GION,
Johannesburg City Engineer's Dept. (Sout Africa).
V. Bolitho.
Water Pollution Control, Vol 69, No 1, p 79-9 1970. 6 fig, 3 tab, 8 ref.

Descriptors: *Sewers, *Sewage disposa *Sewerage, Sewage, Pipelines, Pumping plants, Ur banization, Environmental sanitation, Water pollu tion control.
Identifiers: Johannesburg (South Africa).

The scope of the Johannesburg waste water schem and its future are dealt with in this paper. Adequat sanitation has been an essential prerequisite of ur banization and population predictions in this cit indicate a sanitation problem. The sustained rate o increase in sewage flows has been approximately 1/2% per year compounded and if this rate con tinues the quantities to be handled will double i 10-12 years meaning the same amount of sewerag and treatment facilities will have to be built in tha time as have been built in the past 60 years. Poss ble advancements in the technology of sewag treatment and progressive planning in sewerag systems and designs may alleviate some of the bur den caused by the increasing population. (Ellis Texas)

Identifiers: Feedback loop.

nic feedback modeling of decision making
ss of a California regional water quality board
arried out to study the interactions of the
with various groups having different vested
sts in water quality and the impact of these in-
ions on achieved water quality. Specific ap-
ions of the concepts of industrial dynamics to
onmental systems, termed environmental
n dynamics (ESD), was used to develop the
l of regional board decision making. Califor-
as divided into nine regions for the purpose of
quality management and each region ap-
d a regional board with associated staff and
tive officer (the extended board). The deci-
naking process was formulated as a continu-
nteraction and interplay between the com-
nts of the extended board and specific interest
s. The feedback loop structure used was di-
into five functional areas: generation, desired
y, perceived quality, negotiation, and
nse. The model was structured and tested for
tuation of two distinct interest groups: an in-
al waste discharger and a conservation group
aining opposing positions to an existing
arge. The model was useful for exploration of
plications of alternative institutional arrange-
. (Kriss-Cornell)

se study of water quality planning for the
n Harbor, in which mathematical pro-
ning techniques were applied to seek the best
atives for investing in water pollution control
ies in order to meet target water quality
ia, was described. The control alternatives in-
d (a) waste treatment; (b) transmission of
d or untreated wastes to disposal sites
here in the harbor or surrounding area; and
torage of combined sewerage overflows. In
to supply information to the model about the
nse of the physical system to the inputs of
s at different locations, basic differential
ions governing the movement of water and
s in two-dimensional tidal estuaries were
d. These equations were linear but with time
ng coefficients. The technique for solving
equations permitted the harbor to be divided
irregularly shaped segments rather than a
rm grid of regularly spaced rectangular seg-
s. The model was operated for three assumed
itions to show the sensitivity of decisions to
rtainty in the available data. The first run was
e run; the second run tested the effect of un-
inty in costs of waste treatment; the third run
d the effect of rigid water quality constraint

engineering, Health, Safety, Communication
systems, Data acquisition, *Mine drainage, *Coal
mines, Methane, Oxygen.
Identifiers: Inert gas, Life support systems.

A systems evaluation was made to determine the
engineering feasibility and probable economics of
mining coal in an active deep mine in an oxygen
free atmosphere using current technology in the
application of life support systems to conventional
coal mining techniques. The project was Phase I of
a four phase program to demonstrate that mining
coal in an oxygen free atmosphere will prevent the
formation of acid mine water. Other major benefits
include improved working conditions from a health
and safety standpoint. A detailed investigation was
conducted into the application and suitability of
commercially available inert gas generators, life
support clothing and equipment, and personnel
communications systems. Three sites were in-
vestigated for a demonstration mine. The investiga-
tion revealed it is feasible from an engineering
standpoint to mine coal in an oxygen free at-
mosphere. Life support and associated equipment
are available essentially off-the-shelf. A deep mine
using conventional mining equipment can be
designed to operate in an oxygen free atmosphere.
The comparative economics are extremely favora-
ble when methane gas is recovered and sold.

tion of Lake Michigan and its Tributary Basin, re-
ports are given by the Army Corps of Engineers
and the states of Michigan, Indiana and Illinois.
The reports set forth steps taken to implement a
program previously established by the Conference.
That program includes recommendations covering
industrial wastes, dumping of polluted materials,
wastes from watercraft, pesticides, oil spills and
water quality analysis. Reports consist of progress
made by agencies charged with implementing the
program in the various states, the extent of com-
pliance with standards by the industries, mu-
nicipalities and individuals affected, and or-
dinances and legislation passed to effectuate the
Conference recommendations. (Douberley-

06. WATER RESOURCES PLANNING

6A. Techniques of Planning

NATURAL RESOURCE SYSTEMS MODELS IN DECISION MAKING.
Purdue Univ., Lafayette, Ind. Water Resources Research Center.

Available from NTIS as PB-197 111, $3.00 in paper copy, $0.95 in microfiche. Proceedings of a Water Resources 1969 Seminar, Water Resources Research Center, Purdue University, Lafayette, Indiana, 1970. 245 p. Gerrit H. Toebes, (editor). OWRR Project A-999-IND (4).

Descriptors: *Natural Resources, Water resources, *Decision making, Cost allocation, *Economics, *Planning, Social aspects, *Systems analysis, Optimum development plans, Political systems, Political constraints, Non-structural alternatives, Air pollution, Costs, Operations research, California.
Identifiers: Oswego Basin (Calif), West Basin (Calif).

The text of the publication is based on a series of lectures given for the 1969 water resources seminar at Purdue University. The invited speakers were asked to present their material on a selected theme in an introductory manner with discussion following the formal presentation. The dialogues which ensued in the seminar are not given; however, the lectures are presented in the publication. The first paper is a concise introduction to systems analysis in natural resources management and its relation to the decision making process. The subsequent chapters are arranged according to a visualized hierarchy of systems. The emphasis on the papers II through VII is on the physical system and questions about its modeling, optimization and output evaluation. The papers VIII and IX take up questions in the economic system that is regarded as the environment of the physical system. The papers X through XIII emphasize components in the legal-political system representing the environment of the economic system. Taken together, the material makes for meaningful supplementary reading to the more formal course work in natural resource systems analysis that students are electing in increasing number. RESOURCE SYSTEMS MODELS IN DECISION MAKING,
Purdue Univ., Lafayette, Ind. School of Civil Engineering.
Gerrit H. Toebes.
In: Natural Resource Systems Models in Decision Making, Lafayette, Indiana. Water Resources Research Center, Purdue, University, p 1-44, 1970. 24 fig, 4 tab.

Descriptors: *Decision making, *Model studies, *Systems analysis, *Analytic techniques, Ecology, Administration, Political aspects, Optimization, Management.
Identifiers: *Resource systems.

Resources systems models in decision making and their evolution are set forth in an introductory manner. A liberal use of graphics is made to illustrate the various generic terms in common use; and the operational role of systems analysis in ecological, administrative, and political concerns with water resources use, is noted and portrayed diagrammetrically. Basic systems concepts and systems morphology are defined. Systems synthesis and systems optimization are seen as rather separate activities. A hierarchy of systems is defined and taken as a starting point for model synthesis and decomposition of systems models into functions. A brief introduction to systems analysis techniques is followed by a short discussion of systems evaluation. Finally, the significance of the systems approach to actual decision making in natural resource development and management is considered. (See also W71-03855) (Davis-Chicago)

SYSTEMS ANALYSIS FOR WATER SUPPLY AND POLLUTION CONTROL,
Michigan Univ., Ann Arbor. School of Public Health.
Rolf A. Deininger.
In: Natural Resources Systems Models in Decision Making, Water Resources Research Center, Purdue Univ, p 45-65, 1970. 21 p, 11 fig, 9 ref.

Descriptors: *Systems analysis, *Planning, *Water supply, *Pollution abatement, Sewage treatment, Waste water treatment.

The purpose of this paper was to review the role of systems analysis in the planning of water supply systems and pollution control works. Six examples were briefly outlined which showed the use of new techniques on practically every level of pollution control and water supply engineering. First, the standard steps in a systems analysis study were shown as well as the techniques and tools available for use. These included linear and dynamic programming, digital computer, simulation techniques, etc. The specific examples used to illustrate the use of these techniques were entitled; (a) design of a sewer system; (b) design of sewage treatment plants; (c) design of intercommunity waste water collection and treatment systems; (d) river basin-wide planning; (e) conversational design of treatment plants and automatic plotting of plans and (f) a water supply problem pertaining to the city of Ankara, Turkey. THE EVALUATION OF THE COST OF ALTERNATIVE STRATEGIES FOR AIR POLLUTION CONTROL,
Temple Univ., Philadelphia, Pa. Dept. of Economics.
Azriel Teller, and J. R. Norsworthy.
In: Natural Resource Systems Models in Decision Making, Water Resources Research Center, Purdue Univ, p 87-99, 1970. 13 p, 4 fig, 3 tab, 13 ref.

Descriptors: *Mathematical models, *Linear programming, *Simulation analysis, *Optimization, Air pollution, Quality control, Costs.

Some current work in developing models to evaluate alternative strategies for air resource management was outlined. The social objective was the minimization of the total cost of air pollution to society subject to varying institutional constraints. Two basic models were developed. One, the linear programming model used in conjunction with meteorological transport coefficients, permitted the design of an economically efficient system of air pollution control. In order to achieve higher air quality for a given dollar outlay, or to lower the cost of achieving a given air quality standard, selective, instead of uniform abatement and intermittent abatement based on forecasting meteorological conditions, rather than continuous abatement, were used. The more general simulation program described not only optimized the model but permitted consideration of non-linear functions as well as limited management of the time-phased abatement investment decision problem facing industries. By adjusting parameters in the simulation program, the sensitivity of the optimal abatement plan design to uncertainty in cost, meteorologica and other data was determined. A method for es mating the cost of satisfying a sequence of quali standards over several years was discussed. (Se also W71-03855) (Kriss-Cornell)

PLANNING FOR THE OSWEGO BASIN I NEW YORK--A SYSTEMS APPROACH,
New York State Div. of Water Resources, Albany.
Allen C. Tedrow.
In: Natural Resource Systems Models in Decisio Making, Water Resources Research Center, Pu due Univ, p 100-114, 1970. 15 p, 11 fig.

Descriptors: *Simulation analysis, *Systems analysis, *Optimization, *Reservoir operation, *Mathematical models, Cost-benefit analysis, Lake Canals, Flood control, New York.
Identifiers: Oswego Basin.

A simulation model, used to seek an optima operating policy and to do planning for new work for the Oswego Basin in New York, was develope according to the basic objectives of the New Yor State Division of Water Resources. These basic ob jectives were that (a) the plan should be multipu pose; (b) the plan should be comprehensive; an (c) affected parties may participate in decisio making. The Oswego Basin has a drainage area o some 5,100 sq. miles and contains 9 major lake six of which are under local control, the other thre comprising a reservoir-canal system under stat management. Finding better management an regulation plans for the existing reservoir syste was the problem to be solved. To define the system two simulation models--one for flooding and on for budgeting monthly flows, were developed. Th model consisted of some 50 nodes and some 3 unit hydrograph inputs. It was subdivided into th following sectors: (a) flood damage, (b) conserva tion, (c) quality, (d) supplementary irrigation, (e water supply, (f) navigation, (g) recreation (in cluding boating), and (h) fish and game. The floo simulation sector had a time scale considerably les than the monthly scale of the other sectors. In th studies outlined, the primary measurement criteri was net costs and benefits as best they could b identified. (See also W71-03855) (Kriss-Cornell)

Descriptors: *Optimization, *Mathematical models, *Systems analysis, *Economies of scale, *Forecasting, Costs, Sewage treatment, Probability, Sanitary engineering.

Economic safety factors have been developed to provide a hedge against errors inherent in using population forecasts. Optimal treatment plant expansions were calculated by minimizing the expected value of long-term investment costs. Factors considered were growth rate, forecast uncertainty interest rate, inflation, and learning-curve effect, and construction cost economy-of-scale. When a linear growth rate was anticipated, the interest rate and the economy of scale factor M determined the design period, the growth rate did not. However, when the growth rate was uncertain, it was possible to hedge against the possible cost of selecting the wrong period of design by reducing the design capacity 5 to 10%. Exponential growth always yielded a shorter design life than the linear growth pattern. Therefore, even when a linear growth in demand was not expected, it was helpful to use the linear growth expansion criterion to establish an upper bound on the design capacity. The examples presented suggested simple optimization methods which were applicable for some situations, and introduced the concept of applying safety factors as a hedge against uncertainty in design forecasts. TOOLS FOR WATER-RESOURCE STUDY,
Illinois State Water Survey, Urbana.
Julius H. Dawes.
Journal of the Irrigation and Drainage Division, ASCE, Vol 96, No IR4, p 403-424, December 1970. 22 p, 18 fig, 3 tab, 10 ref, 2 append.

Descriptors: *Water resources development, *Cost-benefit analysis, Reservoirs, Pumps, Wells, Sewage treatment, Data collection, Management, Economics.

Studies that have been made or are currently under way at the Illinois State Water Survey on the cost and benefit of various elements of water resource development were described. Some of the Illinois studies completed were: Cost of Reservoirs; Costs of Wells and Pumps, Water Transmission Costs; Cost of Pumping Water; and Cost of Sewage Treatment. A full account, including data collection, data analysis, and cost comparisons, were given for each study. Examples for use of the methods developed were also presented. The Illinois State Water Survey intended that these tools be used as a basis for comparison between alternatives for creation of water resource use, development and, management models. The results were said to have the same degree of certainty as incorporated in the basic data. The costs estimates will be helpful in linking quantity, quality, and economic parameters to the physical system, and alternative solutions to meet the objectives determined by economic, social and political criteria will be possible. Planners and decision makers will be in a more favorable position knowing what the alternatives and consequences will be from their actions. (Kriss-Cornell)

OPTIMIZATION FOR PLANNING AND LOCATION OF PRECIPITATION STATIONS IN THE JEMEZ MOUNTAINS,
New Mexico State Univ., University Park. Engineering Experiment Station.
Jon D. Hicks, and J. V. Lunsford.
Technical Report No 65, August 1970. 176 p, 31 fig, 8 tab, 4 append, 9 ref. NMSU-EES-65-70.

Descriptors: *Optimization, *Correlation analysis, *Computer programs, *Project planning, *Relocation, *Precipitation (Atmospheric), Data collection, Mapping, New Mexico.
Identifiers: Jemez Mountains.

One of the stated objectives of the Weather Modification Research Program being conducted in the Jemez Mountains by New Mexico State University was the development of an adequate terrestrial precipitation measurement system. The objectives of this study were to determine, by correlation analysis, if the precipitation station locations utilized in the first winter of operation were located for the most effective data collection and to develop procedures for analysis by which subsequent data from relocated stations could be similarly analyzed. Computer programs were presented which computed the necessary statistics needed in the evaluations and a graphical mapping procedure was presented which aided in the understanding of the statistics computed. Based on the correlation of the event totals of each station with all other stations, and the areas of iso-correlation as shown on the maps, eleven stations could be relocated for more efficient data collection. It was recommended that a minimum distance of five miles between the stations in all directions be suggested for efficient data collection. A map of a possible relocation pattern based on the results of this study was shown. (Kriss-Cornell)

A WATER-QUALITY SIMULATION MODEL FOR WELL-MIXED ESTUARIES AND COASTAL SEAS: VOLUME I, PRINCIPLES OF COMPUTATION,
Rand Corp., Santa Monica, Calif.

J. J. Leendertse.
Memorandum, RM-6230-RC, February 1970. 71 p, 27 fig, 15 ref.

Descriptors: *Simulation analysis, *Mathematical models, *Water quality control, Estuaries, Coasts, Tidal waters, Flow, Wastes, New York.
Identifiers: Jamaica Bay.

The principles of computation of water quality simulation in well-mixed estuaries and coastal seas were described. The model was based upon numerical integration of the flow equations which simulated the water movements of tides and upon numerical integration of the advective diffusion equation which represented the movement of dissolved waste constituents. The partial differential equations which formulated the two-dimensional movement of waste constituents were approximate by two difference equations, which were used in succession for a step-by-step solution in time. To assess the validity of the results obtained an analysis was made of the behavior of the solution method. The computational procedures were tested on models of Jamaica Bay, Long Island, New York. A model with a computational grid size of 500 feet was used for the computational tide levels and velocities in this shallow bay, which has many tidal flats. In addition, the dispersion of coliform bacteria from a large number of time-varying sources were computed. (Kriss-Cornell)
W71-04038

OPTIMIZATION OF WATER RESOURCE SYSTEMS INCORPORATING EARTHQUAKE RISK: PROGRESS REPORT NO 1,
California Univ., Los Angeles.
C. M. Duke, and J. A. Dracup.
Progress Report No 1, June 1970. 57 p, 11 fig, 78 ref, append. OWRR Project B-017-CAL (1).

Descriptors: *Optimization, *Water resources development, *Earthquakes, *Costs, Statistical methods, Damages, Risks.

Water resource system planning was optimized with respect to earthquake risk by incorporating the earthquake and cost functions into the optimization process. Emphasis was placed on water resource systems rather than individual structures or components. The focus was on planning decisions such as aqueduct routing and reservoir locations. The earthquake effects considered were classed as (1) violent shaking and (2) permanent differential displacements related to fault movement. Some guidance as to costs of making system components earthquake resistive was provided through documented cases of damage and non-damage in past earthquakes. The key cost parameter in this research was the cost to design, build and maintain the structure to withstand effects that have produced failures. The generation, flow and processing of information relative to the earthquake effects on a designated type of structure at a specified site in a water resource system was shown. Cost provided the language as well as the criteria for optimization and the cost increment to enable the system to resist earthquake effects was represented. Distribution of earthquakes was expressed statistically in terms of size, space and time. Specific forces, due to shaking and fault slip, applied to the structure by earthquakes that occur over its design life were determined. The procedure used led to an estimate of the incremental earthquake cost of placing a particular type of structure (e.g. an earth dam) on a specific site (e.g. Bouquet Canyon). (Kriss-Cornell)

Descriptors: *Optimization, *Model studies, *Dynamic programming, *Stochastic processes, *Water resources development, Reservoirs, Linear programming.
Identifiers: *Techniques, *Steady state conditions.

Recently developed techniques used in water resources modeling and optimization were presented. Three general classes of problems dealt with were: the modeling and optimization under steady state conditions, the modeling and optimization under dynamic or unsteady state conditions, and stochastic modeling optimization. Results obtained were summarized under the titles: single reservoir system, multiple reservoir system, the establishment and up-dating of water resources model, and development of additional techniques. The detailed discussion of these problems was presented in each of the appendices. Such specific techniques as dynamic programming, a search technique, the stochastic maximum principle, conjugate gradient and gradient projection, quasilinearization, and others were used to formulate the models described in the individual papers. Descriptors: *Optimization, *Water resources, Multiple-purpose reservoirs, Computers, Constraints.
Identifiers: *Gradient projection method, Nonlinear programming.

The gradient projection model was applied to the optimization of complex water resources systems. This was a nonlinear programming technique used to treat the nonlinear utility functions without simplification and to solve the large number of variables involved without dimensionality difficulties. Two water resources problems involving multiple reservoirs and multiple purposes were solved by the technique. To illustrate the approach, an example solved by Maass and coworkers was solved b gradient projection method. The two multi-pur reservoirs used had the purposes of irrigation power generation. It was assumed that there two seasons in a year, the dry season and the season. The flow data and flow balances shown. Constraint equations were formulated the problem was solved by the gradient projec method. A four-period water resources model then shown. With very approximate ini guessed values on the variables, only three to iterations with a few seconds computation needed to obtain the optimum. (See also W 04043) (Kriss-Cornell)

WATER RESOURCES PLANNING IN T URBAN-METROPOLITAN CONTEXT,
North Carolina Univ., Chapel Hill. Dept. of and Regional Planning.
Maynard M. Hufschmidt.
In: Natural Resource Systems Models in Decis Making, Lafayette, Indiana, Water Resou Research Center, Purdue University, p 115-1 1970. 5 fig, 8 ref.

Descriptors: *Planning, *Cities, *Methodolo *Water resources, River basins, Economic effici cy, Federal government.
Identifiers: *Metropolitan water resource mana ment, Urban water systems planning, Wa resource planning, Income redistribution, Envir mental quality, Objectives, River basin planning.

The major emphasis in water resources planning federal agencies is on macro-systems in a ri basin context. This planning practice is increasin less relevant to metropolitan water resou development. This gives rise to two types questions. First, what is being done in the way urban water systems planning and which are systems characteristics. Second, what changes the water planning methodology are needed in

an context. The often advanced objectives of nomic efficiency, income redistribution, and ironmental quality remain basic, but the rela- attention to specific problems will change. A ic problem is the divergence between urban and eral objectives where federal funding of needed ks is involved. Such divergence becomes more arent when considering refinement of basic ob- ives in the form of guides and criteria. The eral attention to the river basin can be at odds conditions following from urban geography. the ranking of problems as to significance eals basic differences. These topics are ussed with the aid of examples drawn from an settings in the eastern USA. (See also W71-55) (Davis-Chicago)

VATE AND SOCIAL COSTING AS DECI- N DETERMINANTS IN WATER SOURCES,
gers-The State Univ., New Brunswick, N.J. ter Resources Research Inst.
. Whipple, Jr.
Natural Resource Systems Models in Decision king, Water Resources Research Center, Pur- University, Lafayette, Ind., p 162-178, 1970.

criptors: *Economics, *Interest, *Risk, *Costs, cision making, Benefits, Cost-benefit-analysis, nomic justification, Resource allocation, Third y effects, Social aspects.
tifiers: *Social costs, *Externalities, Opportu- costs.

paper's theses are (a) just as private costs are d in business decisions, social costs should be rminants in public decision-making; (b) many ciples of social cost determination are available use; (c) such principles are absent when it es to interest rate and taxation questions; (d) work on the social cost of pollution is urgently needed. Differences in rates of return after taxes can be ordered in terms of disutility of unexpected losses. It is proposed that the social cost of Federal investment be computed using a discount rate equal to that of Federal bonds, less an allowance for currency depreciation, plus an allowance for risks assumed. It is reasoned that the relationship between taxation and social costs is in need of much more investigation before the established system can be declared unsound. Identifiers: *Environmental management, *Resource management.

The areas of relevance in regard to the interaction considered herein are: (1) attitudes, (2) knowledge, (3) technology, (4) choices and decision making, and (5) public institutions for environmental management. Attitudes need to be redirected from that of entrepeneurial service to public service. The major area of inadequacy with respect to knowledge lies in the response of natural environment to man's activities. Technology is limited in its problem-solving capability by the inadequacy of knowledge of environmental response. Making choices and decisions involves many intangibles. Therefore, attitudes become increasingly important to the decision-making process. Regional insitutions for resource and environmental management must be developed if real progress in problem-solving is to be accomplished. These concepts are illustrated by results of several local studies set in Iowa. (See also W71-03855) (Davis-Chicago)

AN ECONOMIC EVALUATION OF THE WATER QUALITY ASPECTS OF CONTRA COSTA COUNTY'S OFFSHORE WATER SUPPLY.
Metcalf and Eddy, Inc., Palo Alto, Calif.

Report to the Contra Costa County Water Agency, Martinez, California, November 16, 1965. 287 p, 37 fig, 56 tab, 61 ref.

Descriptors: *Economic prediction, *Evaluation, *Water quality control, *Deltas, *Water pollution control, *Encroachment, *Saline water-freshwater interfaces, Salinity, Sea water, Saline water intrusion, Estuaries, Brackish water, Tidal effects, Annual benefits, California.
Identifiers: *Contra Costa County, San Francisco Bay, Sacramento-San Joaquin Delta.

An attempt was made to reduce to the cost frame of reference the benefits or detriments to those segments of the County's economy which may be affected by changes in the quality of the offshore waters, now and in the future. The uncertainty of future Delta water supplies has required that the recent past historical water quality be used as a basis for benefit determinations. The benefits included are those which are susceptible of monetary evaluation. This area studied is the central and eastern portion of the County and represents about 30 percent of the total county. The two main sources of impaired water quality are: (1) salt water incursion from San Francisco Bay; (2) mineralization of the fresh offshore waters by return flows of irrigation from the Central Valley via the San Joaquin River system. Offshore water quality criteria are assumed for two distinct methods of achieving quality control: (1) construction of a physical barrier at Dillon Point or Chipps Island, and (2) a hydraulic barrier consisting of regulated fresh water outflows for salinity repulsion. Estimates are given of the annual savings to presently established and future industry and the economic benefits related to groundwater, recreation, fisheries, agriculture, municipal water supplies, unimproved land values, and the assimilative capacities of offshore waters. Benefits are estimated for the present and the year 2000. (Poertner)

THE ECONOMIC IMPACT OF ALTERNATIVE WATER CONDITIONS, A REPORT TO THE CONTRA COSTA COUNTY WATER AGENCY.
Metcalf and Eddy, Inc., Palo Alto, Calif.

Report to the Contra Costa County Water Agency, Martinez, California, April 8, 1969. 103 p, 14 fig, 4 tab, 8 ref.

Descriptors: *Economic prediction, *Evaluation, *Water quality control, *Water pollution control, *Encroachment, *Saline water-freshwater interfaces, Deltas, Salinity, Sea water, Saline water intrusion, Estuaries, Tidal effects, California.
Identifiers: *Contra Costa County, *Sacramento-San Joaquin Delta.

Specific water quality control proposals were evaluated and the effects studied of a diminishing fresh water supply on Western Sacramento-San Joaquin Delta water quality and on the economy and environment of the area. Where possible, monetary values have been assigned. Chloride-ion concentration was selected as the primary control constituent because it is an indicator of the degree of salt water incursion in the estuarine system of the Western Delta. Other water quality constituents, such as total dissolved solids and total hardness, were also considered because of their effects on the market uses of water. Three factors influence the future availability of Contra Costa's offshore water supply: (1) increasing upstream depletions and out-of-basin export; (2) increasing quantities of agricultural, municipal and industrial wastes which are discharged to tributary receiving waters upstream from the Western Delta; (3) changes in the tidal hydraulics of San Francisco Bay and the Delta from land filling and reclamation projects. Conclusions concerning ecological changes and the economic impact of alternative water conditions are presented, based on the year 2000 and the present. The monetary benefits or detriments to Contra Costa's water-using industry, municipalities and agriculture have been computed for three distinct offshore water quality conditions. The economic effects of water quality changes on wastes dischargers have also been determined.

COMMENTS ON 'THE LINEAR DECISION RULE IN RESERVOIR MANAGEMENT AND DECISION RULE IN RESERVOIR MANAGEMENT AND DESIGN' BY CHARLES REVELLE, ERHARD JOERES AND WILLIAM KIRBY,
Harvard Univ., Cambridge, Mass.
L. M. Eisel.

Water Resources Research, Vol 6, No 4, p 1239-1241, Aug 1970. 4 p, 1 fig, 7 ref.

Descriptors: *Evaluation, *Linear programming, *Reservoir design, Management, Constraints.

The author discussed ReVelle's et al proposed reservoir operating policy which simplified reduction of probabilistic chance constraints to their deterministic equivalents. A comparison to Young's, Bryant's, and Watermeyer and Thomas' investigations of optimal and near optimal linear operating rules was made. In both the deterministic and stochastic models, the assumptions were unclear regarding initial storage, which was expressed as a function of reservoir capacity. The form of the constraints incorporated into the stochastic case was also unclear. ReVelle, et al gave insufficient demonstration that their chance-constrained model adequately represented reality for preliminary screening or more advanced design purposes. (Kriss-Cornell)

Water Resources Research, Vol 6, No 4, p 1242-1245, Aug 1970. 4 p, 4 ref.

Descriptors: *Optimization, Evaluation, Reservoir Operation, Design, Management, Economics.
Identifiers: *Linear decision rule (LDR).

A reply to comments made by Loucks and Eisel on the authors' paper 'The Linear Decision Rule in Reservoir Management and Design' was made (See also W70-10054). These comments illuminated several problems in the interpretation and economic justification of linear decision rules. Four specific points were made: (1) that the observation that Young's linear operating rules were of a different form from the linear decision rule (LDR) was embarrassingly correct; (2) that Loucks' interpretation of the initial storage constraints was correct and applied equally well to the deterministic formulation; (3) that Loucks suggests that the LDR does not deal effectively with serially dependent input processes; and (4) that Eisel points out that the LDR model should be compared with more realistic models to validate the LDR assumptions and to assess the quality of the LDR design. Despite these and other objections, the authors try to prove that the LDR bears consideration as a useful complement to existing optimization models and as a conceptual basis for further development of reservoir management theory. Identifiers: *Socio-economic patterns, *India, *Developing countries, Multivariate principle components analysis.

An attempt is made, using Indian government data, to identify underlying patterns of areal association using 15 selected socio-economic indices (variables) which are considered to reflect the significance of India's socio-economic structure, statistical techniques were designed to elicit a maximum amount of information from a minimum number of relevant variables. Product-moment correlation coefficients were used as inputs to a multivariate principle components analysis and the basic association patterns of India's socio-economic structure emerged: socio-economic development, socio-economic underdevelopment, incipient commercialization, rural manufacturing and agricultural intensity. The physical, social and economic factors underlying these patterns are described, the spatial variations mapped and the data analyzed for internal homo-or heterogeneity. The highest positive values showed systematic clustering, conforming to major political and physical subdivisions. The major categories of socio-economic structure are associated mainly with social and water availability factors. The categories are: (A) developed urban-involving literate populations and large-scale industry; (B) backward tribal areas with inhospitable terrains such as forest cover or arid lands, augmenting inaccessibility; (C) flat, fertile lands and an adequate water supply with or without irrigation, supporting an urban-rural hierarchy; (D) areas of comparatively low water availability where agricultural income is supplemented with household activities and (E) areas with the greatest water availability, whether irrigation or rainfall, and with sufficient market incentives. versity is one of the major criteria in the develop-nt of natural resources. A monoculture is less ble than a complex of organisms–catastrophic ults associated with such things as disease, edators, weather influences, or absence of buffer cies are more likely to occur as diversity inks. It is concluded that society minimized risk maintaining diversity which may have the effect sacrificing maximum productivity. (See also 1-04271) (Holmes-Rutgers)

The current period of high interest rates and escalating construction costs requires careful consideration of economic factors during the planning of facility expansion. Population, commercial and industrial growth trends must be studied to determine long-range customer requirements. A comprehensive planning study should result in the most economical method of meeting future customer demands. When two alternative methods of reaching a desired result exist, a present worth analysis may be used to find the most economical one. Utilities usually borrow money to finance capital projects. The cost of this money is the interest which must be paid to the lender. The means of raising funds are different for public and private utilities. These differences affect the interest rates which must be paid, hence, the present worth analyses are affected also. Present worth analyses require the determination of capital requirements for future construction. The method recommended by the authors involves the estimation of construction costs using current data, the preparation of graphs which show annual increases in costs for major items, and the correction of the initial estimate on the basis of information gained from the graphs. Major construction projects may be postponed in the hope that interest rates will drop, but these gains may be more than offset by rising construction costs. (Hewett-Rutgers)

The world water budget is reviewed and several major river systems are discussed in detail. Although the world has an enormous amount of water, it is not evenly distributed. The desert land area of the world is far greater than the area of all croplands. The Ganges Plain of India and the San Joaquin Valley in a desert area of California are described and compared in terms of climate, geophysical aspects and current agricultural productivity. The output of the Ganges Plain, relative to its resources, compares unfavorably. An analysis of the problems involved indicates that the factor limiting the conversion from indigenous agriculture to intensive, multi-crop cereal production is not water, soil or sunlight, but power production, which in turn facilitates both N fertilizer production and water transport. Most modern agriculture is essentially petroleum based, but in an underdeveloped, oil-poor country such as India, power production should be based on coal and/or nuclear energy. A detailed budget is worked out for nuclear-powered irrigation water pumping in which crop production is increased sevenfold. The basic production technology and cost structure of nuclear powered desalination are reviewed. Water use efficiency in variou crops and world crop prices are listed. It is argued that in order to achieve an economically feasible agriculture based on nuclear desalination, the number of crops/yr, crop water efficiency, power technology and power costs must all be weighed and coordinated in a careful planning project. PRIVATE AND SOCIAL COSTING AND PRICING AS DECISION DETERMINANTS,
Ohio State Univ., Columbus. Dept. of Economics.
Richard A. Tybout.
In: Natural Resource Systems Models in Decision Making, Lafayette, Indiana Water Resources Research Center, Purdue, University, p 152-161, 1970. 1 fig, 3 ref.

Descriptors: *Costs, *Economic efficiency, *Decision making, Governments, Compensation, Cost-benefit analysis, Pollution abatement, Water pollution, Standards.
Identifiers: *Social costs, *Private costs, Externalities, Bribery, Inter-industry compensation, Enforced waste ownership, Effluent taxes, Quality standards, Tax credits.

The calculations made in cost-benefit analysis and the private profit calculations are of the same form. In the latter, costs external to the enterprise are not included as the market mechanism does not force the enterprise to do this. One objection to the resulting divergence between social and private costing is the attendant inefficiency. In regard to water pollution, two approaches to internalize social costs have been advanced. These are: legal accountability with inter-industry compensation and bribery. The latter is argued to be impractical. Alternatives available to the Government to decrease the discrepancy between private and social costing are: enforced waste ownership, effluent taxes, quality standards, and tax credits. It may be said that private and social costing lead to rather different decisions in regard to pollution production and abatement. Bringing these calculations in better accord is a complex physical, economic and political problem. It can, however, yield substantial efficiency benefits. (See also W71-03855) (Davis-Chicago)

BENEFIT-COST ANALYSIS AND MULTIPLE OBJECTIVES: CURRENT ISSUES IN WATER RESOURCES PLANNING,
Bowdoin Coll., Brunswick, Maine; and Wisconsin Univ., Madison.
A. Myrick Freeman, III, and Robert H. Haveman.
Water Resources Research, Vol 6, No 6, p 1533-1539, December 1970. 7 p, 17 ref.

Descriptors: *Benefit-cost analysis, *Water resources development, Public benefits.
Identifiers: Multiple objective planning.

Some basic principles pertinent to a multiple objective planning effort were discussed and both the rationale for the regional development objective and the logical and empirical basis for including some form of regional development in project analysis was considered. Exception was taken to Major's (1969) assertion that we are on the verge of being able to use empirical social welfare functions in public policy analysis. A multiple objective planning problem was said to be an evaluation technique which accomodates both money valued and nonmoney valued effects. Three essentially noncommensurable objectives (national income, regional development, and environmental quality) dealt with by Major were discussed. The use of a regional objective in water resource development was questioned since little is known about the role of water resources investment in regional income charge. This judgement was based on five considerations, which were described in detail. The major criticism to Major's belief that multiple objective public investment planning will lead to discovery of a social welfare function was that it contained a fairly elaborate algebraic and geometric approach to multiple objective benefit-cost criteria without giving sufficient attention to the logical analysis of objectives or the formal aspects of the multiple objective evaluation problem. CONSTRUCTION COST OUTLOOK - 1970-1971,
James Webber.
Journal American Water Works Association, Vol 62, No 11, November 1970, p 715.

Descriptors: *Construction costs, *Cost trends, Costs, Estimated costs, Inflation (Economic), Economics, Labor supply, Cost comparisons.

Rises in construction costs have far exceeded the expectations of consulting engineers and owners, to the extent that, often, even the lowest bids for jobs exceed the owner's ability to pay. Eighteen to twenty percent increases in construction labor costs have triggered large increases in wages paid to manufacturing employees, and consequently, further price rises are expected. Restrictions on union membership have maintained labor shortages which will severely affect the construction industry in the next few years. Labor productivity is not increasing, and some industrialization of construction will be necessary to offset continuing cost rises. Projects should be designed to be more than just efficient. Bidding should be scheduled to avoid peak bidding periods. Jobs should be widely advertised to insure competition among bidders. Materials should be carefully selected to reduce initial and long-term costs. Capital costs are not likely to drop soon, and waiting until they do will only see compensating rises in construction costs. It is probable that cost inflation will reduce the purchasing power of the construction dollar as much in the first three years of this decade as in the entire decade of the Sixties. (Hewett-Rutgers)

CAN COSTS BE CUT,
Walter B. Sinnot, Joseph D. D'Annunzio, Charles V. Roberts, and Chester A. Ring.
Journal American Water Works Association, Vol 62, No 11, November 1970, p 694-704. 5 tab.

Descriptors: *Construction costs, *Bids, *Induced costs, Contract administration, Planning, Engineers estimates, Economics, Costs, Evaluation, Administration, Cost repayment, Engineering, Design, Construction, Right-of-way.
Identifiers: *Cost reduction.

This paper is a joint discussion by an engineer, a contractor, an equipment supplier and an owner on ways to cut costs during the design and construction of water systems and treatment facilities. The engineer can save money by developing the water supply as a multipurpose impoundment rather than a single purpose impoundment wherever possible, by using the most up-to-date design criteria and technology, and by using functional rather than esthetic materials whenever possible. The bids received for a job may be reduced by lowering the costs a contractor incurs in making a bid, by supplying detailed plans and specifications, and good subsurface data. Things such as rights-of-way, backfilling, concrete finishing, equipment specifications and method of payment can also affect the overall bid by a contractor. Equipment must be chosen to reduce installation, operation, and maintenance costs. Many problems can be avoided and time and money saved by putting out a separate equipment contract. Owners and operators can keep their costs to a minimum by using up-to-date administrative procedures, by using new low-cost materials in construction and maintenance, and by modernizing treatment processes as much as possible. Many utilities waste money by improper planning, and by not planning far enough in advance. (Hewett-Rutgers)

ER USE IN TENNESSEE, PART D - SUM-
Y,
essee Dept. of Conservation, Nashville. Water
urces; and Geological Survey, Nashville,
M. Wilson, and Alfred M. F. Johnson.
19 p, 8 fig, 9 tab, 24 ref.

riptors: *Tennessee, *Water supply, *Water
ation, *Water demand, Rivers, Streams, Sur-
waters, Groundwater, Water resources, Water
rces development, Natural resources, Legal
ts, Riparian rights, Water requirements,
r users, Human population, Industrial use
er), Hydroelectric power, Aquifers.

narizing the total water use in Tennessee in
this report illustrates through the use of ta-
and graphs the amount of water used, the
es of the water, and the allocation of water
een agricultural, industrial, municipal, and
stic users. Tables are broken down into coun-
county and user-by-user figures. The percent-
f available water withdrawn from each major
basin is also graphed. The report also points
ome legal aspects of water use in Tennessee,
ding the requirement that large quantity users
er with the State Division of Water
urces. Tennessee follows the riparian rights
ine except that, contrary to the general rule,
decision has permitted withdrawal for mu-
l purposes. (Liptak-Florida)

Water Law and Institutions

LEGAL SYSTEM: STRUCTURE OR CON-
INT FOR SYSTEMS ANALYSIS DECI-
-MAKING,
na Univ., Bloomington. School of Law.
n Tarlock.
atural Resource Systems Models in Decision
ng, Lafayette, Indiana, Water Resources
rch Center, Purdue University, p 179-190,
9 ref.

iptors: *Legal aspects, *Institutional con-
ts, *Decision making, *Water resources
opment planning, Systems analysis.
fiers: *Legal system, Physical system, Public
eering decisions.

are fundamental differences between the
and the physical systems approaches to water
rces development. Legal decisions are
cterized by: concern with past events, con-
with a few parties, the settlement of disputes;
incidental and temporary, unpredictable
s, immediate solutions and indirect long range
ons. In contrast, public engineering decisions
naracterized by: concern with future events,
rn about all parties, the prevention of
es, the optimal and semi-permanent, more
ctable results, deferred solutions, and direct
range solutions. These distinctions are illus-
by considering how the legal and physical
ns affect decisions in three areas: allocation of
resources, drainage and flooding, and en-
mental quality. The fundamental dissimilari-
hat characterize water resources law often provide constraints for the physical and economic system. Yet the interaction of these systems generates changes. On the one hand, legal structures are created conducive to implementing systems analysis solutions. On the other hand, legal developments force incorporation of broader alternatives into physical systems analysis. (See also W71-03855) (Davis-Chicago)

CONDITIONS OF LEGAL AND POLITICAL FEASIBILITY,
Indiana Univ., Bloomington. Dept. of Political Science.
Vincent Ostrom, and Elinor Ostrom.
In: Natural Resource Systems Models in Decision Making, Lafayette, Indiana, Water Resources Research Center, Purdue University, p 191-208, 1970. 3 fig, 15 ref.

Descriptors: *Legal aspects, *Political aspects, *Water resources development, *Feasibility, *Decision making, Optimization, Evaluation, Institutions, Planning, Economic feasibility, Financial feasibility, Technical feasibility.
Identifiers: Decision rules, Management systems.

If programs of action in the field of water resource development are to be successful, they have to satisfy technical, economic, financial, legal, and political criteria. Often there is a large array of alternative solutions each producing 'goods' and 'bads' where these terms stand for the broadest possible interpretation of 'benefits' and 'costs'. Maximizing the production of 'goods' is guided by constraints that derive from decision rules of conduct. Law is the prime example of such a set of decision rules. In solving total water resources problems, however, rules become uncertain and the associated politics are a game played under rules that change during the game. Therefore, applied political theory must allow for changes in rules, players, values, and utility functions and their associated probabilities. Water resource decision making involves evaluation of legal and political rules, risks, and opportunities by a team of engineers and lawyers cooperating to suggest needed institutional arrangements. Water resources involve a very complex bundle of goods. Legal relations reflect this, e.g., by the presence of more than one doctrine of water rights. The relation between property right and public authority is particularly relevant in the design of management systems. Such systems often require the institution of new decision rules as condition of long-run political feasibility. The use of a coastal acquifer in Southern California is used as a case study. INSTITUTIONAL DESIGN FOR WATER QUALITY MANAGEMENT: THE IMPLICATIONS OF A SYSTEMS APPROACH FOR LEGAL AND ADMINISTRATIVE ARRANGEMENTS,
Wisconsin Univ., Madison. Dept. of Regional Planning.
Irving K. Fox.
In: Natural Resources Systems Models in Decision Making, Lafayette, Indiana, Water Resources Research Center, Purdue University, p 209-221, 1970. 4 fig, 3 ref.

Descriptors: *Institutions, *Water quality, *Systems analysis, *Legal aspects, *Administration, Institutional constraints, Evaluation, Regulation, Economics of scale.
Identifiers: *Water quality management, *Legal-administrative reform, Subsidies.

Relatively recent changes in legal-administrative water arrangements have not yet resulted in conditions under which the systems approach can be properly applied and its decision results implemented. The nature of this problem is illustrated with several examples. Legal-administrative arrangements, conducive to implementing systems analysis results, should incorporate two groups of attributes. The first group includes: (a) technical competence to isolate efficient systems and alternatives; (b) ability to elicit process changes by industry; and (c) capacity to operate joint system components. While at present no agency has all these attributes, they are probably easier to realize than the capabilities of the second group. These include: (a) setting of standards; and (b) evaluating their costs as to magnitude and distribution. The implications of the systems approach for legal-administrative reform are: (a) avoid general subsidies that encourage economies of scale; (b) decrease reliance on regulation of individual discharges; and (c) ascertain the production functions of industries relative to water process changes. RECOMMENDATIONS CONCERNING PROPOSED LEGISLATION TO AUTHORIZE WATER MANAGEMENT DISTRICTS IN FLORIDA.
Cornell (Maurice H.) and Associates, Miami, Fla.

Recommendations Concerning Proposed Legislation To Authorize Water Management Districts in Florida, Department of Water Resources, State of Florida, Nov 1960. 20 p, 3 fig.

Descriptors: *Florida, *Legislation, *Water management (Applied), *Water districts, Local governments, State governments, Federal government, Drainage, Drainage districts, Administrative agencies, Legal aspects, Taxation, Administration, Planning, Regulation, Institutions, Governments, Management.

Recommendations by a commercial engineering firm for legislation authorizing water management districts in Florida, this report emphasizes that: (1) new legislation should be applicable to any state area, (2) local government should have a strong voice in planning and operation, (3) taxation to finance water district operations should be commensurate with the benefit derived, and (4) legislation should not be patterned after that of other states. Specific proposals are made for legislation creating water management districts and sub-districts, and regulating their relations with local government. The purposes, powers, duties, and organization of the proposed districts are included, along with provisions for dealing with federal agencies. Charts illustrate the organizational links between the state and local levels of the proposed water district system. The report's conclusion emphasizes the necessity for carefully drafted legislation to enable Florida to meet its water problems. (Hart-Florida)

WATER RIGHTS LAW AND MANAGEMENT IN WEST VIRGINIA -- FUTURE NEEDS AND ALTERNATIVES,
West Virginia Center for Appalachian Studies and Development, Morgantown.
Marlyn E. Lugar.
Water Rights Law and Management in West Virginia--Future Needs and Alternatives, Office of Research and Development of the West Virginia Center for Appalachian Studies and Development, West Virginia University, Public Affairs Series No 4 (May 1967). 50 p, 38 ref.

Descriptors: *West Virginia, *Water law, *Water utilization, *Non-structural alternatives, Riparian rights, Water management (Applied), Administration, Legal aspects, Water rights, Water policy, Judicial decisions, Legislation, Prior appropriation, Preferences (Water rights), Regulation, Watershed management, Surface waters, Streams, Watercourses (Legal), Groundwater, Hydrologic cycle, Riparian waters, Riparian land, Future planning (Projected).

Dealing with water rights law and management in West Virginia, this paper: (1) explains why water

shortages may occur in West Virginia, (2) examines the legal rights to the water which is available, and (3) suggests certain changes in the water-use law. It is argued that development of sound principles of law to regulate the use of surface and groundwater must recognize the hydrologic cycle. West Virginia case law has adopted the riparian rights doctrine, but has not applied it to the use of surface water. The paper surveys various aspects of the doctrine as applied to both surface and underground streams, including: (1) uses by riparian owners, (2) uses on riparian tracts, (3) uses by municipalities, (4) rights of riparian owners, (5) what is reasonable use, and (6) investments under the doctrine. The author recognizes a need for watershed management in West Virginia and notes that the existing West Virginia water-use law should be re-examined. A model program is the Huron River Watershed in Michigan. Standards for regulation of water use should be determined by the legislature based on public policy. A major weakness in the current West Virginia law as to water in streams is that it does not fix with certainty the extent of the rights to use water therefrom. (Powell-Florida)

RIGHTS TO SURFACE AND SUBSURFACE WATER IN MASSACHUSETTS.
Legislative Research Council of Massachusetts.

Commonwealth of Massachusetts Senate Report No 695, Submitted by the Legislative Research Council Relative to Rights to Surface and Sub-Surface Water in Massachusetts, Feb 13, 1957. 124 p, 7 fig, 6 tab, 20 append.

Descriptors: *Massachusetts, *Water law, *Surface waters, *Subsurface waters, Water rights, Water resources, Riparian rights, Water supply, Groundwater, Water pollution, Floodwater, Navigable waters, Fish, Wildlife, Recreation, Water resources development, Drainage, Water utilization, Rainfall, Administrative agencies, Judicial decisions, Water storage, Industrial water, Public rights.

Prepared by the Legislative Research Council of Massachusetts as a guide to the Water Resources Commission, this report examines: the state of water law in Massachusetts, present and future demands for water supplies, problems of water pollution, and water resources management. The report limits itself to statistical research and fact-finding and does not make recommendations or legislative proposals. Chapter headings include: (1) Water Law in Massachusetts, (2) Riparian Doctrine and Water Resources, (3) Present and Future Water Uses, (4) Industry, (5) Agriculture, (6) Recreation, (7) Hydroelectric Power and Navigation, (8) Flood Control, (9) Pollution, (10) Groundwater, (11) Management Programs in Massachusetts and Other States, and (12) Problems Ahead. Considerable attention is given to water supply, demand, use, consumption and waste. The riparian doctrine receives broad treatment as the basis of Massachusetts water law. There is an examination of case law and legislation in the area of water law and, in an appendix, a digest of leading Massachusetts cases. Attention is also given to various federal and state programs. (Duss-Florida)

NEW HORIZONS IN WATER RESOURCES ADMINISTRATION,
Resources for the Future, Inc, Washington, D.C.
Irving K. Fox.
New Horizons in Water Resources Administration, Resources for the Future, Inc, Washington, DC, April 1965. 8 p, 31 ref.

Descriptors: *Investment, *Administrative agencies, *Water resources development, *Cost-benefit analysis, Federal government, Cost-benefit ratio, Economics, Feasibility studies, Project planning, Cost-benefit theory, Costs, Cost repayment, Cost analysis, Administrative decisions, Interest, Interest rate, Debt, Financing, Financial analysis, Administration, Institutional constraints, Political aspects, Water management (Applied).

Two means of improving administration of water resources are considered in this review: continual evaluation of cost-benefit ratios of water resources projects, and a checks-and-balances framework for administrative agencies to promote efficiency. The author's basic premise is that feasibility of water resources projects depends upon whether benefits exceed costs. He presents six factors to be considered in evaluating water resource investments: (1) the interest required to be paid for public investment; (2) secondary benefits, or those indirectly derived; (3) the difficulty of valuing some development, such as scenery; (4) the range of alternatives other than water to accomplish the desired end; (5) future projections of usefulness of the project; and (6) the multitude of variables influencing the project. Three methods of improving the efficiency of administrative agencies are examined: (1) use of market-like signals as inducement for agencies to act in the public interest; (2) restructure of administrative organization to permit politically responsible administrative action; and (3) use of counter-vailing arrangements to foster efficiency. (Hart-Florida)

MENTELSON V STATE (LIABILITY FOR FLOOD DAMAGE RESULTING FROM STATE'S OBSTRUCTION OF DRAINAGE CHANNEL).
218 App Div 210, 218 NYS 223-229 (Sup Ct App Div 1926).

Descriptors: *New York, *Spoil banks, *Dam failure, *Canal embankments, Flood damage, Dams, Canals, Drainage, Buildings, Walls, Obstruction to flow, Rain, Storm runoff, Surface runoff, Water injury, Adjudication procedure, Legal aspects, Judicial decisions, Damages, State governments, Precipitation excess, Canal construction, Historic flood.

Plaintiff building owner sued defendant state for damages caused by the collapse of plaintiff's building. Defendant had canalized a river, depositing the spoils alongside the river, and the spoilbank obstructed a drainage channel which flowed near plaintiff's building. After an extraordinary but not unprecedented rainfall, which broke a dam upstream from plaintiff's building, flooding caused by the obstructed outlet undermined plaintiff's building. Defendant contended that the breaking of the dam was the proximate cause of the injury. The Supreme Court of New York stated that: (1) defendant had the burden of proving that other causes created plaintiff's loss; (2) defendant's liability was identical to that of an individual; and (3) defendant would be liable notwithstanding the extraordinary character of the flood. Holding that defendant had created a nuisance by erecting the spoil bank, the court adjudged defendant liable for plaintiff's loss. (Hart-Florida)

THE DOCTRINE OF CONSEQUENTIAL D*AS AFFECTED BY VALUATION FORMULA
Robert P. Schuster.
Land and Water Law Review, Vol 4, No 2, p*557, 1969. 19 p, 57 ref.

escriptors: *Condemnation value, *Eminent main, *Condemnation, *Damages, Land appraisal, Land, Real property, Governments, Legal pects, Judicial decisions, Economics, Land use, nd resources, Urbanization, Cost analysis, Anals, Appraisals, Costs, Evaluation, Benefits, Cost ocation, Value, Compensation, Economic imct.

e author of this comment advocates restricting doctrine of consequential loss, a doctrine which nies compensation to a condemnee for the taking rights so remote as to be incidental to the conmnation of physical property. The elements verning compensability in condemnation ceedings are stated to be: (1) property; (2) tak; and (3) just compensation. As any one of these ments becomes more loosely defined, those inces in which the doctrine may be imposed ome fewer. The concept of 'taking' has become ad enough that land flooded by a dam may be nd to have been appropriated, requiring comsation. Attention is given the legal development the doctrine and the equitable considerations igating for its restriction. Special emphasis is ced on the land use considerations suggesting riction of the doctrine. The author contends a doctrine of compensation for only what is sically taken, rather than what the condemnee ually uses, leads to inefficient land use. The nor proposes that more protection be afforded expectations and reliance interests of connees. (Dye-Florida)

RCORAN V VILLAGE OF BENNINGTON GHT TO WATER AND SEWER SERVICE RMITS).

A2d 457-466 (Vt 1970).

criptors: *Vermont, *Water permits, *Zoning, rmits, Land use, Water delivery, Sewers, Local ernments, Administrative decisions, Public ts, Land tenure, Real property, Legislation, Jual decisions, Legal aspects, Land classification, d development.
tifiers: Injunction (Mandatory).

ntiff mobile-home subdivision owner sought to pel defendant village authorities to issue per for water and sewer service. Defendants had d to act on plaintiff's application for several s. Plaintiff contended he was entitled to the nits applied for plus a court order requiring the re issuance of such permits, notwithstanding a ng ordinance enacted subsequent to his appli n and excluding mobile-home subdivisions. ndants, relying on an earlier zoning ordinance h also barred such subdivisions, contended their refusal to act was within their discretionowers. Stating that sewer and water services are tter of right which may not be used as zoning uments, the court held that mobile home subion owners are entitled to sewer and water serunder the same terms and conditions as other ents. After finding invalid the zoning orce in effect at the time of plaintiff's applicathe court ordered defendants to grant the per previously applied for. However, the court ed to compel the issuance of future permits such permits are subject to reasonable regula, and the court would not prejudge defendants' ns in imposing such regulations. (Earlda)

RAULIC RACE CO V GREENE (INPRETATION OF LEASE PROVIDING FOR OF ALL SURPLUS WATERS OF CANAL).

App Div 374, 245 NYS 444-461 (Sup Ct).

riptors: *New York, *Leases, *Contracts, ials, Industries, Legal aspects, Judicial deci, Water rights, Adjudication procedure, Rela rights, State governments, Governments, Water contracts, New York State Barge Canal, Transportation, Water sources, Channel flow, Navigation.
Identifiers: Patents (Land).

The state leased to plaintiff waters of the Erie Canal under a contract which allowed plaintiff the use of all waters of the canal not needed by the state for navigation. Defendant superintendent of public works sought to interfere with plaintiff's use of the waters, contending that the maximum quantity of water leased to plaintiff was that amount not necessary for navigation at the time of the execution of the contract. Plaintiff sought to restrain defendant's interference. The Supreme Court of New York reversed an official referee's judgment for defendant. Contracts for consideration, involving the state as lessor of surplus canal waters, should be construed favorably to the patentee. Effect must be given to the mutual intent of the parties. In this case the contract leased all waters not necessary for navigation, not merely surplus waters existing at the time of the contract's execution. When enlargement of the canal increased the surplus, plaintiff was entitled under the lease to the entire surplus amount. (Dye-Florida)

WYKLE V COLOMBO (APPORTIONMENT OF ACCRETIONS BETWEEN ADJACENT RIPARIAN OWNERS).

457 SW2d 695-701 (Mo 1970).

Descriptors: *Missouri, *Accretion (Legal aspects), *Boundary disputes, *Adjudication procedure, Boundaries (Property), Riparian land, Rivers, Navigable rivers, Navigable waters, Banks, Riparian waters, Land tenure, Real property, Prescriptive rights, Docks, Recreation facilities, Legal aspects, Judicial decisions, Surveys, Mapping.

Plaintiff riparian owner brought action against adjacent riparian owner to establish title by adverse possession to certain land to which defendant held record title. Affirming a judgment for defendant, the Supreme Court of Missouri noted that the trial court was correct in not partitioning the land formed by accretion along the river bed bounding the property of the parties. The court held that plaintiff's petitions and exhibits contained insufficient information to enable the trial court to properly determine the boundaries and to apportion the accreted land between the adjoining riparian owners. POWER OF CITIES AND TOWNS TO PROVIDE DRAINAGE AND SEWAGE FACILITIES.
Iowa Code Ann secs 368.26, 368.43 thru 368.46 (Supp 1969).

Descriptors: *Iowa, *Cities, *Drainage systems, *Sewage disposal, Public health, Sewage, Sewage treatment, Drains, Surface waters, Drainage, Surface drainage, Contracts, Legislation, Assessment, Floodwater, Local governments, Government finance, Supervisory control (Power), Sewage districts.

Governments of cities and towns shall have the power to provide drainage systems for flood and other surface waters and to regulate connection of private drains thereto. Municipalities may order connections from private property when public health and safety require and may have such works done if their order is not complied with. Municipal governments shall also have the power to provide sewer systems and sewage disposal plants, and may regulate sewer connections to private property. They may order installation of sanitary toilet facilities on property abutting a sewer line, and may cause the work to be done and assess costs if their orders were not complied with. Also included are provisions regarding extension of sewer systems and powers of cities to enter into contracts with sewage disposal operators outside corporate limits. All cities with populations of more than 100,000, through which a stream flows furnishing drainage for any adjoining cities upstream, shall have the power to construct the drains and sewers necessary to protect the public health. Various procedural sections are included, outlining procedures to be complied with in the construction of sewers and establishment of sewer districts. (Duss-Florida)

THE DELAWARE RIVER BASIN COMPACT--AN ALTERNATIVE FOR IMPLEMENTING WATER RESOURCES MANAGEMENT (ORGANIZATION, OPERATION, AND RESULTS OF THE BASIN COMPACT),
J. W. Thursby.
Address, Southern Water Resources Conference, 15th Meeting, Tulsa, July 16-18, 1969, p 11-19. Council of State Governments, Atlanta, Ga. Southern Office.

Descriptors: *Delaware River Basin Commission, *Water resources development, *River basin development, *Interstate compacts, Water utilization, Delaware River, Interstate rivers, Delaware, New York, New Jersey, Pennsylvania, Conservation, Governments, Interstate commissions, Nonstructural alternatives, Project purposes, Water conservation, Water policy, Water supply, Water pollution control, Watershed management, Public utilities, Recreation facilities, Reservoirs, Flood control.

Presented at a meeting of the Southern Water Resources Conference, this address outlines the authority, responsibilities, duties, administrative arrangements, results, and continuing problems of the Delaware River Basin Commission. The Commission is responsible for water resource development in the Delaware River basin and was created by the Delaware River Basin Compact signed by Delaware, New York, New Jersey, and Pennsylvania. After outlining the background, organization, and operations of the Commission, the text discusses program successes in the areas of: water supply, in incorporating storage and flow control facilities, in water quality, and in setting waste discharge standards for river zones and individual dischargers. The speaker briefly mentions problems and projects relating to flood control, watershed management, recreation facilities, rehabilitation of fish and wildlife resources, and promotion of hydroelectric power resources. The text concludes that the interstate compact is an effective approach to water resources development because of its broad scope and powers. The need for additional legislation to deal with particular problem areas is cited. (Liptak-Florida)
W71-04089

THE PROPOSED POTOMAC RIVER BASIN COMPACT,
Julian M. Alexander.
Address, Southern Water Resources Conference, 15th Meeting, Tulsa, July 16-18, 1969, p 5-10. Council of State Governments, Atlanta, Ga. Southern Office.

Descriptors: *River basin commissions, *Water resources development, *River basin development, *Interstate commissions, Water utilization, Legislation, Water pollution control, Water quality control, Flood protection, Administration, Administrative agencies, Coordination, Project planning, Legal aspects, Adjudication procedure, Maryland, Virginia, West Virginia, Pennsylvania, District of Columbia, Watershed management, Multiple-purpose projects, Water policy, Water supply, Interstate compacts.
Identifiers: *Potomac River Basin Commission.

Presented at a meeting of the Southern Water Resources Conference, this address outlines the organization, powers, and purposes of the proposed Potomac River Basin Commission. The Commission is to be created by an interstate compact to be

signed by Maryland, Virginia, West Virginia, Pennsylvania, and the District of Columbia. The basin-wide commission would cooperate with and coordinate the individual agencies already responsible for pollution abatement, flood prevention, watershed management, scenic and recreational development, and water supply. The text outlines the problems and responsibilities of the proposed Commission in each of these areas. The Commission will have authority for research and planning, but actual implementation and construction will be left to the already existing agencies under Commission coordination and supervision. The author points out that the commission will be accountable to the public and its actions subject to judicial review. (Liptak-Florida)
W71-04090

THE POLITICS OF WATER,
Council of state Governments, Atlanta, Ga. Southern Office.
Tom Adams.
Address, Southern Water Resources Conference, 14th Meeting, Miami Beach, July 31-Aug 2, 1968, p 16-19.

Descriptors: *Political aspects, *Water resources development, *Non-structural alternatives, *Water allocation (Policy), Governments, Inter-agency cooperation, Planning, Government finance, Water policy, Legislation, Regulation, Water Resources Research Act, Flood control, Water conservation, Water utilization, Water supply, Inter-basin transfers, Interstate commissions, Water Resources Planning Act.

Presented at a meeting of the Southern Water Resources Conference, this speech distinguishes between two types of water problems: (1) practical problems, technical solutions to specific problems; and (2) political problems, generation of public interest and financing to implement the practical solutions. The author considers the three most pressing political problems to be: (1) comprehensive state and interstate water resources inventory and planning, (2) inter-basin transfer of water supplies, and (3) regulation of water use to guarantee equal access to the available water supply. The text concludes that all of these problems are within present technological capabilities, but that none can be solved without political and public support for the financial and administrative programs necessary to implement the available technology. (Liptak-Florida)

A NATIONAL POLICY FOR THE ENVIRONMENT: SELECTED EXCERPTS FROM THE CONGRESSIONAL RECORD AND CONGRESSIONAL DOCUMENTS, FALL, 1969, 91st CONGRESS. 1st SESSION.
Library of Congress, Washington, D.C. Legislative Reference Service.

Part I, December 1969. 156 p; Part II, January 1970. 24 p. TP450.

Descriptors: *Federal government, *Environment, *Legislation, *Federal project policy, Conservation, Administrative agencies, Ecology, Environmental effects, Natural resources, Wildlife, Aquatic life, Water supply, Water pollution, Pollution abatement, Air pollution, Oceans, Water policy, Public health, Beneficial use, Fresh water, Waste disposal, Balance of nature, Administration, Leadership, Research and development.
Identifiers: *National Environmental Policy Act.

Tracing the history of the National Environmental Policy Act of 1969, these selected excerpts from the Congressional Record and from congressional documents include: (1) debate on Senate Bill 1075, to establish a national policy for the environment; (2) debate on Senate Bill 7, to amend the Federal Pollution Control Act; (3) debate on House Resolution 12549, to amend the Fish and Wildlife Coordination Act for establishment of a Council on Environmental Quality; (4) Senate Report 91-296 accompanying Senate Bill 1075; (5) debate on the Conference Report on Senate Bill 1075; and (6) Public Law 91-190, the National Environmental Policy Act of 1969. The overriding concern of the debates was the use of environmental management to bring about improvement in the quality of the environment. The existing governmental organizations were seen as inadequate to cope with the complexity of environmental problems, thus creating a need for a national policy and a council on Environmental Quality. Prominent consideration was given to research and investigations into: ecological systems, natural resources, and the quality of the environment. (Duss-Florida)

DELAWARE RIVER BASIN COMPACT.

Delaware River Basin Commission, Trenton, January 1967. 51 p, 1 map.

Descriptors: *Delaware River Basin Commission, *Delaware River, *Interstate compacts, *Water resources development, United States, Pennsylvania, Delaware, New York, New Jersey, Legislation, Interstate rivers, Interstate commissions, navigable rivers, Riparian rights, Hydroelectric power, Federal government, State governments, Administrative agencies, Water pollution, Flood protection, Watersheds, Watershed management, Taxes, Water pollution control.

The Delaware River Basin Compact of 1961 between Delaware, New Jersey, Pennsylvania, New York and the United States is supervised by the Delaware River Basin Commission. The purpose of the Compact is to provide for cooperation among the signatory states in developing and utilizing the water resources of the Delaware River. Article 2 creates the commission and establishes its composition, procedures, and jurisdiction. The Commission's power and duties are promulgated in Article 3. Article 4 authorizes the Commission to supervise water supply from the Delaware. Provisions are made for storage, release of waters, and assessable improvements. The Commission also is given full power over: (1) pollution control, (2) flood protection, (3) watershed management, (4) recreation, (5) hydroelectric power, and (6) withdrawals and diversions. Article II provides for intergovernmental relations. Other articles provide for capital financing, plans, programs, and budgets. General provisions for such things as tax exemptions, oaths of office, insurance, condemnation proceedings, tort liability, and riparian rights are promulgated in Article 14. Part II of the Compact deals with effectuation and publishes the ratifying acts of the legislatures of the signatory states. (Hart-Florida)

INFORMATION FOR APPLICANTS FOR CONSTRUCTION, ALTERATION, OR REPAIR OF DAMS.
New Jersey Department of Conservation and Economic Development, Trenton, 1958. 28 p, 7 plate.

Descriptors: *New Jersey, *Dams, *Legislation, *Permits, Administrative agencies, Dam construction, Dam design, Dam foundations, Earth dams, Damsites, Design flood, Spillways, Hydrologic data, State governments, Legal aspects, Engineering, Engineering structures, Governments, Administration.

Information required for dam building and repair in New Jersey is furnished by this pamphlet. The New Jersey statutes pertaining to dams and obtaining permits to construct or repair dams are set forth in full at the beginning. The statutes are followed by general information for applicants, stating that the following data must accompany each application: (1) location plan, (2) general site plan, (3) engineering report, (4) construction drawings, and (5) technical specifications. The engineering report requirements are next set forth in detail followed by a guide outline for site investigatio order to make a rational determination o required spillway capacity, the type, design cr for them are suggested. The pamphlet list describes the usual types of spillways utiliz New Jersey: (1) overfall, (2) ogee, (3) chut auxiliary, and (5) siphon or gated. A formu calculating the discharge capacity of a spill provided. Further information includes: requirements for drawings submitted with ap tions, (2) standard conditions to which all pe are subject, and (3) a series of specimen dra (Hart-Florida)

ntifiers: *Land and Water Conservation Fund t of 1965.

cusing on the Land and Water Conservation nd Act of 1965, this study compares the congresnal decisions to commit land and water ources to specified use patterns to the results in t achieved by such legislation. The evolution, pact, and future significance of the LWCP Act erience are evaluated through an analysis of: intergovernmental and organizational relationps, (2) decision-making processes, and (3) nomic and political realities. Part I of the study siders the federal response to those public reational preferences which resulted in the CF. Part II examines the response of states to LWCF program. The state of Washington's atpts to meet public recreational demands, the innce of the LWCF on Washington's programs, the role of state agencies, policies, and cedures are discussed in Part III. In Part IV, mon factors in the state and federal experience the LWCF are considered in terms of program ctives and operating methods. Also considered such problems as: financing, zoning, assessnt, easements, planning, staffing, taxing, federale division of revenues, and appropriations in the of resource policy. (Earl-Florida)

VELOPMENT OF OCEAN SPACE--AN IN-RNATIONAL DILEMMA,
id Pardo.
isiana Law Review, Vol 31, No 1, p 45-72, 0. 28 p, 32 ref.

criptors: *Oceans, *International law, *Natural urces, *Law of the sea, Beds, Legal aspects, Inational waters, Commercial fishing, United Nas, Governments, Foreign waters, Foreign coun-, United States, Conservation, Beds under r, Regimes, Ownership of beds, Boundaries perty), Continental shelf, Water pollution, ution abatement, Water pollution control, -structural alternatives, Relative rights.

Identifiers: *Ocean resources.

Discussing the problem of controlling the depletion of the natural resources of the high seas, this article points to increasing pollution and fish stock depletion as examples of the fallacy in the existing international law philosophy, that is, that the seas' resources are inexhaustible. The present law says nothing about the seabed other than the continental shelf itself. The author proposes a shift of emphasis in international law from settling internation disputes to establishing guidelines for the protection and development of the oceans' resources. He suggests an independent international agency to serve as trustee of the oceans' resources and to allocate and manage development rights in the ocean floor. The author also discusses the difficulties in obtaining United Nations action, specifically the failure to agree on basic legal principles governing exploitation of the sea beds. The difficulty centers on the failure to agree on three basic questions: (1) the basic concept, whether to retain the idea of the freedom of the high seas or to adopt a common heritage-public trust approach; (2) the nature of the international regime, whether its competence should be limited to specific resources or extended to control of all ocean uses; and (3) the definition of the limits of national jurisdiction. The author concludes that early action is vital since the oceans' resources continue to be depleted while coastal states haggle over national objectives. (Liptak-Florida)

INSURING MAXIMUM BENEFICIAL USE OF WATER THROUGH LEGISLATION,
Kansas Univ., Lawrence.
H. E. Thomas.
In: Transactions of the Sixth Annual Conference on Sanitary Engineering, p 13-22, University of Kansas, Lawrence, Kansas, 1956. 10 p, 1 map.

Descriptors: *Legislation, *Beneficial use, *State governments, *Water resources development, Consumptive use, Domestic water, Non-consumptive use, Preferences (Water rights), Prior appropriation, Administrative agencies, Legal aspects, Priorities, Reasonable use, Remedies, Surplus water, Unappropriated water, Water sources, Water utilization, Proration, Riparian rights, Relative rights, Riparian waters, Severance, Prescriptive rights, Natural use.

The overall hydrologic pattern of the United States is categorized by this article into geographic areas with: (1) water deficiency; (2) water surplus; and (3) winter surplus and summer deficiency. Regulation and development of water use, encouragement of use modifications which will most benefit society, and protection of established rights and opportunities to develop water are cited as recommended objectives of legislation. The following problems for state legislation are examined: (1) limitation of rights, (2) protection of rights, (3) recording water rights, (4) authority and responsibility of the administrator, (5) policy guides for the administrator, (6) preferential use vis-a-vis priority of use, and (7) reservoir regulation. The author notes three doctrines for limiting water rights: (1) correlative, (2) mutual prescription, and (3) appropriation. Since preferential use and priority of use are both potentially controlling factors in determining water rights, it is observed that a state, in order to prevent confusion, should determine which doctrine prevails. The author concludes that legislation developing beneficial use should: (1) clearly define water rights, (2) provide broad authority and policies for the administrator, (3) utilize scientific study as a basis, and (4) encourage local responsibility for developing water resources. (Hart-Florida)

CONTINENTAL SHELF LAW: OUTDISTANCED BY SCIENCE AND TECHNOLOGY,
Jean T. Drew.
Louisiana Law Review, Vol 31, No 1, p 108-120, 1970. 13 p, 71 ref.

Descriptors: *Continental shelf, *International law, *Natural resources, *Technology, Law of the sea, International waters, Regimes, Oceans, Treaties, Continental margin, Continental slope, Coasts, Beds, Beds under water, Ownership of beds, Boundaries (Property), Conservation, Resource development, Governments, Regulation, Legislation, Legal aspects, Jurisdiction, Non-structural alternatives.

Examining the need for changes in the national and international law governing the continental shelf, this article points out the variance between the geological and legal definitions of the shelf. Newly developed and emerging uses of the shelf are discussed, and the development of present law is traced through the Truman Proclamation, the United Nations Convention on the Continental Shelf, and the Outer Continenetal Shelf Lands Act. Implications of United States v Ray, 423 F.2d 16 (5th Circ. 1970), are examined, including the uncertainty created, in coastal state's rights in the shelf, by new uses. The major defect of the present law is that it is limited to defining the coastal states' rights in the shelf's natural resources while new technology has made possible new uses of the shelf for transportation, defense, recreation, research, and even residential housing. The author concludes that this new technology demands that laws be revised or devised to insure coastal state adequate authority to pursue and govern all reasonable uses of the continental shelf. (Liptak-Florida)

WATER QUALITY CONTROL: A MODERN APPROACH TO STATE REGULATION,
Frank E. Maloney, and Richard Ausness.
Albany Law Review, Vol 35, No 1, p 28-59, 1970. 32 p, 131 ref.

Descriptors: *Water resources development, *Administration, *Water quality control, *Legislation, Water utilization, Administrative agencies, Planning, Abatement, Water pollution control, Water quality, Institutions, Water conservation, Water resources, Water Resources Research Act, Regulation, Permits, Non-structural alternatives, Standards, Legal aspects, Jurisdiction, Remedies, Administrative agencies, Supervisory control (Power).
Identifiers: *Model Water Codes.

Presenting chapter 5 of a six-chapter Model Water Code drafted at the University of Florida, this law review article sets forth a suggested state program for water quality control. The text of chapter 5 of the Code is provided, followed by a commentary on the origin and purpose of each section. After defining the usage of terms such as water quality, impairment of water quality, pollution, and wastes, the Code authorizes a State Water Resources Board to adopt and administer a water quality program. The program consists of classifying the state's waters, setting water quality standards, adopting a comprehensive plan, and providing for review and revision of the plan and thestandards. Local governing boards will issue permits for construction or operation of facilities affecting water quality, carry out inspections, and order abatement of violations of the standards. The Code also provides for jurisdiction for the local boards to seek injunctive relief against violators. The authors point out that the failure of prior efforts at state-wide water-quality programs stems from the tendency to provide legal authority without the financial support necessary for enforcement. (Liptak-Florida)

FEDERAL ENFORCEMENT UNDER THE REFUSE ACT OF 1899,
James T. B. Tripp, and Richard M. Hall.
Albany Law Review, Vol 35, No 1, p 60-80, 1970. 21 p, 78 ref.

Descriptors: *Rivers and Harbors Act, *Water pollution control, *Navigable waters, *Remedies, Wastes, Legislation, Judicial decisions, Rivers, Industrial wastes, Domestic wastes, Municipal

wastes, Oil wastes, Sewage, Waste water (Pollution), Pollutants, Water pollution, Water pollution sources, Pollution abatement, Water quality control, Waste disposal, Waste water disposal, Legal aspects, Regulation, Permits.
Identifiers: *Refuse Act.

Noting that old, under-utilized statutes may be applied to present problems, this article discusses the proscriptions and remedies provided by the Refuse Act of 1899, originally known as the Rivers and Harbors Appropriation Act of 1899. That act prohibits the discharge of any refuse into any navigable waters and provides for civil and criminal remedies. The authors discuss the Act in context with other sections of the Rivers and Harbors Act which also promote the protection of the nation's navigable waters. The article analyzes the judicial interpretations of the following terms and phrases: (1) 'refuse' (2) 'other than that flowing from streets and sewers and passing therefrom in a liquid state,' (3) 'suffer to be deposited,' (4) 'deposit,' (5) 'the bank of any navigable water,' and (6) 'impeding navigation.' Also examined is the requirement of scienter under the Act. The article also outlines the available criminal and civil remedies and discusses the procedures for obtaining injunctive relief against a polluter. The authors conclude that many questions of interpretation, notably whether a private right of action exists, await further cases to be resolved. (Liptak-Florida)

WATERSHED PROJECTS.

Hearings--Subcomm On Conservation and Credit, Comm On Agriculture--US House of Representatives, 90th Congress, 2nd Session, Jan 22, 23, July 9, 10, 11, 15, Oct 9, 1968. 202 p.

Descriptors: *Watershed management, *Water resources development, *Cost-benefit analysis, *Legislation, Project planning, Project benefits, Multiple-purpose projects, Water policy, Agricultural watersheds, Water conservation, Soil conservation, Flood protection, Administrative agencies, Federal government, Flood control, Recreation facilities, Drainage, Surface waters, Runoff, Costs, Rainfall, Water storage, Land management, Reservoirs, Reservoir operation.

Hearings were held before the House Subcommittee on Conservation and Credit of the Committee on Agriculture to discuss various proposed watershed projects throughout the United States. The Subcommittee discussed proposed projects located in: South Carolina, Wisconsin, California, Alabama, Florida, Louisiana, Colorado, Arkansas, Kansas, Texas, Indiana, West Virginia, Oklahoma, Idaho, North Carolina, South Dakota, North Dakota, Virginia, Georgia, Iowa, and Kentucky. Of prime interest to the Subcommittee were the cost-benefit ratios of projects, the size of the area benefited, and the number of beneficiaries. Most projected benefits were agricultural. However, urban, transportation, and recreational benefits were frequent. Discussion also centered on the proposed watershed structures, the areas' past experience with flooding, and their history of flood damage. Funding of the project was to come from both federal and local funds. The relative value of each project was important since not all of the proposed projects could be funded from available appropriations. (Duss-Florida)

FEDERAL WATER RESOURCES RESEARCH ACTIVITIES.
Federal Council for Science and Technology, Washington, D.C.

Report to the President on Water Resources Research, Senate Comm on Interior and Insular Affairs, 88th Cong, 1st Sess, March 1963. 213 p, 50 tab, 45 ref.

Descriptors: *Scientific personnel, *Federal government, *Water resources development, *Research and development, Water policy, Water resources, Water supply, Water quality, Hydrologic cycle, Groundwater, Streams, Weather, Water pollution, Environment, Administration, Administrative agencies, Costs, Streamflow, Manpower, Education, Training, Universities, Grants, Projects, Water demand, Water reuse.

The Federal Council for Science and Technology prepared this report on water resources research to provide: (1) policy guidance for federal agencies participating in research and (2) a basis for a coordinated scientific research program on water. An initial summary outlines the Report's findings and conclusions. Chapter I discusses the need for water research, centering on increased water demand in the future and the value of planning for more efficient use of water resources. Chapters 2 and 3 discuss the federal government's responsibilities for water resources research and the responsibilities of specific agencies. Chapter 4 discusses technical problems and research programs. Topics include: (1) the nature of water, (2) the water cycle, (3) water in relation to land management, (4) water resources development and control, (5) water quality, (6) water reuse, (7) economic and institutional aspects of water resources, (8) engineering systems for water resources development, and (9) manpower and research facilities. Estimated costs of various programs are provided. Chapter 5 gives a program summary and evaluation. Chapter 6 discusses the manpower necessary to carry on adequate research, and chapter 7 discusses coordination of the research activities of various federal agencies. Chapter 8 outlines legislative aspects which center on assuring a continued flow of competent manpower for research activities. (Duss-Florida)

ENVIRONMENTAL JURISDICTION IN THE CONGRESS AND THE EXECUTIVE,
Edmund S. Muskie.
Maine Law Review, Vol 22, No 1, p 171-187, 1970. 16 p, 54 ref.

Descriptors: *Federal jurisdiction, *Institutional constraints, *Legislation, *Political aspects, Coordination, Legal aspects, Administrative agencies, Administrative decisions, Non-structural alternatives, Water Quality Act, Water pollution control, Water resources development, Thermal pollution, Impaired water quality, Dredging, Landfills, Pollutants, Jurisdiction, Federal government, Nuclear powerplants, Hydroelectric plants.
Identifiers: Water Restoration Act.

This article examines the scope of, conflicts within, and proposed improvements in federal environmental jurisdiction. The centers of congressional jurisdiction over such areas as thermal pollution, hydroelectric plant location and effects, water pollution, dredging, the filling of wetlands, continental shelf oil leasing, and landfill in harbors and estuaries are described. The article sets forth congressional committees responsible for legislation such as the Water Quality Act of 1965 and the Clean Waters Restoration Act of 1966, and the extent of their authority. Jurisdictional conflicts with other committees and proposals for more coordinated and effective legislative action are discussed. A description is given of the fragmented executive-branch jurisdictional divisions dealing with environmental programs. The article presents proposals for solving conflicts and streamlining the executive environmental programs, policies, and personnel distributions. (Earl-Florida)

COAL CREEK DRAINAGE AND LEVEE DI SANITARY DIST OF CHICAGO (DRAIN DISTRICT'S LIABILITY FOR DISCHARG EXCESSIVE WATER INTO RIVER).

336 I11 11, 167, NE 807-823 (1929).

Descriptors: *Illinois, *Waste dilution, *Disch (Water), *Drainage districts, Drainage, Sew Hydroelectric plants, Drainage effects, Drai engineering, Drainage practices, Drainage grams, Drainage systems, Electric power pro tion, Electric power, Non-consumptive Navigable rivers, Cities, Sewage, Waste disp Sewage disposal, Judicial decisions, Legal asp Adjudication procedure, Floods.

Plaintiff drainage district sued defendant drai district for injury caused by discharge of ex water into a navigable river. Defendant discharged water to dilute sewage and to gene electrical power. The water ultimately flowed a river which passed through plaintiff district statute, defendant was required to use a prescr volume of water for each 100,000 inhabit

laintiff contended that, in order to generate elec-
icity, defendant had negligently used more water
an required to dilute sewage, causing the river to
verflow and injure plaintiff. The Supreme Court
f Illinois stated that: (1) plaintiff must prove de-
ndant's population, the amount of sewage
ischarged, the amount of water required for dilu-
on, and that excessive water caused the injury; (2)
efendant was required by statute to discharge suf-
cient water to prevent the sewage canal from
eing obnoxious; and (3) defendant might utilize
ater to generate electricity, despite its organiza-
on for drainage purposes, when the proceeds were
ed to support the drainage effort. Determining
at the trial court erred in admitting evidence, giv-
g certain jury instructions, and refusing certain
structions, the court reversed the judgment and
manded the action for a new trial. (Hart-Florida)

aintiff manufacturing company brought action to
join defendant manufacturing company from
aintaining flashboards on a federal dam. Plaintiff
o sought damages resulting therefrom. Defen-
nt had applied for, and received from the Federal
wer Commission, a permit to erect the flash-
ards. The resulting increased water height
creased plaintiff's upstream power head. Plaintiff
erted entitlement to flow unobstructed by in-
iduals, despite subjection to the congressional
wer to regulate navigation. Defendant con-
ded that its permit subjected plaintiff to his right
maintain the flashboards. The Court of Appeals
New York stated that: (1) the flow of a navigable
er is not property subject to the fifth amend-
nt; (2) a riparian owner whose lands are un-
ded has no standing for judicial review of con-
ssional decisions to regulate navigable waters;
in absence of supporting evidence, Federal
wer Commission licensing of projects are
iewable; and (4) the Commission's jurisdiction
ssue licenses is reviewable. Determining that de-
dant's right to obstruct the river must be
blished independently of the license, the court
d defendant liable for plaintiff's injury. (Hart-
rida)

ts.

ntiff hydroelectric company sought to condemn
rian land owned by defendant. Plaintiff had to
chase the land, which the backwater from its
would overflow, but was unsuccessful. Defen-
contended that plaintiff could not condemn
lands. The Supreme Court of Indiana held that:
A riparian owner may utilize water lawfully, if
water flows thereafter in its normal state; (2) A
lation grant is not required to erect a dam not
ring the stream's natural course; (3) Plaintiff
authorized by statute to condemn lands for an
orized purpose; (4) A declaration of public
ssity was unnecessary; (5) Plaintiff's lease of electric power did not affect its ability to condemn lands; (6) Operation of the dam for electricity was a public use; and (7) Evidence of comparative benefits and damages from the dam was properly excluded by the trial court. Plaintiff had properly condemned defendant's land after reasonable efforts to purchase. (Hart-Florida)
W71-04217

PARKS V PENNSYLVANIA RR (TITLE TO LAND PREVIOUSLY FLOOD BY BACKWATER).
301 Pa 475, 152 A 682-685 (1930).

Descriptors: *Pennsylvania, *Condemnation, *Land tenure, *Ownership of beds, Flooding, Compensation, Dams, Real property, Eminent domain, Railroads, State governments, Legal aspects, Judicial decisions, Governments, Land, Backwater.
Identifiers: *Adverse possession.

Plaintiff possessor of riparian land sued to eject defendant railroad. The disputed land had been previously overflowed by backwater from a dam, and title to the flooded land was vested in the state by condemnation. The dam later broke, and the water receded. The dam was not restored. Plaintiff took possession, but the state conveyed the land to defendant. Plaintiff claimed title by abandonment, in that defendant had failed to use the land, and by adverse possession. Noting that whether compensation was paid for the condemned land was immaterial, the Supreme Court of Pennsylvania held that title had been in the state by condemnation. Plaintiff could eject defendant only on the strength of his own title, rather than the weakness of defendant's. The court held that the state's title was not divested by abandonment. Failure of a state's grantee to use granted land may result in divestment of the grantee's title, but does not revest title in its former owner. Determining that plaintiff had not established adverse possession for the statutory period, the court held that title was in defendant. (Hart-Florida)
W71-04243

BAY RIDGE DOCK CO V UNITED DRY DOCKS, INC (RIGHT TO FILL TO BULKHEAD LINE INCLUDES RIGHT TO MAINTAIN FLOATING DRY DOCK).

146 Misc 404, 262 NYS 212-216 (1932).

Descriptors: *New York, *Landfills, *Bulkhead line, *Piers, Navigable waters, Beds, Navigation, Docks, Remedies, Riparian land, Riparian rights, Riparian waters, Ownership of beds, Real property, Land tenure, Relative rights, Regulation, Governments, State governments, Legal aspects, Judicial decisions.

Plaintiff dock company brought action to restrain defendant dock company from mooring a floating drydock adjacent to defendant's pier and over defendant's submerged land. Plaintiff contended that the dry dock interfered with navigation and with access to plaintiff's pier. Defendant contended that the dry dock was inside the established bulkhead line and could be maintained under defendant's right to fill up to the bulkhead line. The court noted that the grant of lands under water and the establishment of a bulkhead line gave defendant a right to fill. Although there is a right of navigation over such submerged land until the right to fill is exercised, defendant had the right to maintain the dry dock as long as the required minimum clearance between piers was maintained. Plaintiff could not, at the expense of defendant's property rights, enlarge his right of access beyond the minimum clearance. (Liptak-Florida)

HANOVER DRAINAGE AND LEVEE DIST V SANTA FE DRAINAGE AND LEVEE DIST (DRAINAGE DISTRICT'S AUTHORITY TO REMOVE NATURAL BARRIER AND CHANGE DIRECTION OF DRAINAGE FLOW).
319 111 142, 149 NE 752-754 (1925).

Descriptors: *Illinois, *Ditches, *Drainage districts, *Natural flow, Drains, Drainage systems, Natural flow doctrine, Drainage water, Drainage, Surface waters, Surface runoff, Levees, Drainage effects, Legislation, Water rights, Alteration of flow, Obstruction to flow, Watersheds (Divides), Watershed management, Legal aspects, Judicial decisions.

Plaintiff drainage and levee district petitioned for permission to construct a drainage ditch and connect it with defendant district's ditch. Landowners in plaintiff district had petitioned for and obtained an order requiring plaintiff to improve its drainage. Defendant objected and contended that the connection would require the removal of a natural barrier to the flow of water. This would change the natural flow of water from east to west. Reversing a judgment for plaintiff, the Supreme Court of Illinois held that, where the connection would result in reversing the direction of the natural flow of water and the removal of natural barriers to flow, plaintiff had no right or authority to connect its ditches to that of defendant. (Liptak-Florida)
W71-04246

PENNSYLVANIA RR V LINCOLN TRUST CO (RAILROAD AND MUNICIPAL NEGLIGENCE IN MAINTAINING WATER PURITY).
167 NE 721-730 (Ind App 1929).

Descriptors: *Indiana, *Cities, *Railroads, *Water supply, Water pollution sources, Water pollution, Water pollution effects, Public health, Mortality, Pollutants, Epidemics, Diseases, Pipelines, Water delivery, Adjudication procedure, Judicial decisions, Legal aspects, Damages, Remedies.
Identifiers: *Contaminated water supply.

Plaintiff administrator of decedent's estate sued defendant railway company and defendant municipality for wrongful death. The city had authorized the railroad to tap into its water system. The railroad's system was defective and permitted contaminated water to flow into the municipal system, causing decedent's demise from typhoid. Plaintiff asserted that the city was negligent in failing to inspect the railroad's connection and that the railroad had negligently maintained its system. The Appellate Court of Indiana stated that the city was not a guarantor of its water, but was bound to use reasonable care to insure an uncontaminated supply. Plaintiff was not required to prove with absolute certainty that drinking water caused decedent's death, nor was plaintiff required to prove that the city actually knew the water was contaminated. Determining that the evidence supported the trial court's holding that defendants' negligence was the proximate cause of decedent's death, the court held both liable. (Hart-Florida)

PUBLIC WORKS AUTHORIZATIONS, 1968 - RIVERS AND HARBORS - FLOOD CONTROL AND MULTIPLE PURPOSE PROJECTS - PART I.
Committee on Public Works (U. S. Senate). Subcommittee on Flood Control - Rivers and Harbors.

Hearings Before the Subcommittee on Flood Control - Rivers and Harbors, of the Public Works Committee, United States Senate, 90th Congress 2nd Session, Jan 30, 31 and Feb 1 and 7, 1968. 96 p, 10 illus.

Descriptors: *Political aspects, Federal government, Federal Project Policy, *Permits, *Water permits, Administrative agencies, Public rights, Recreational facilities, Reservoir operation, *Legislation.
Identifiers: Floating facilities, Federal reservoirs.

The subcommittee met to consider S2236, a bill which would prohibit the Secretary of the Army from collecting any fee for the issuance of any permit or license for any private floating facility on any of the waters of any project administered by the Secretary acting through the Chief of Engineers. The bill would not prohibit the Secretary from requiring a permit or license for any such floating facility. The Corps of Engineers issues permits allowing members of the public to construct floating facilities for private use on Federal Reservoir Projects. The Corps also allows commercial floating facilities to be constructed on these reservoirs in return for a rental fee. On November 17, 1966 the Corps issued a circular stating that permits would henceforth be issued upon a charge to all owners of floating facilities used for private purposes. Voluminous testimony presented to the subcommittee reflected the general feeling that the change would be contra to the nation's long established toll-free waterways policy and would tend to defeat the purposes of federal legislation to expand outdoor recreational facilities, notwithstanding that the fee purports to charge for the use of federal land beneath the facility and not for the use of the water itself. No decision is reported. (Molica-Florida)

HEARINGS BEFORE THE SUBCOMMITTEE ON FLOOD CONTROL - RIVERS AND HARBORS; THE COMMITTEE ON PUBLIC WORKS, UNITED STATES SENATE, 90th CONGRESS, 2nd SESSION.
Committee on Public Works (U. S. Senate). Subcommittee on Flood Control - Rivers and Harbors.

Hearings - Sub Comm on Flood Control - Rivers and Harbors - Comm on Pub Wks, US Senate, Jan 30, 31, Feb 1 and 7, 1968. 194 p.

Descriptors: *Federal government, *Legislation, *Federal project policy, *Projects, Project purposes, Project benefits, Costs, Cost allocation, Cost-benefit ratio, Local governments, Economics, Navigable waters, Administration, Adoption of practices, Flood control, Flood protection, Aquatic weed control, Beach erosion, Harbors, Construction, Multiple purpose projects, Breakwaters, Legal aspects, Social aspects, Regions.

During these hearings before the Subcommittee on Flood Control - Rivers and Harbors, several bills were discussed, witnesses heard and documents presented. Items considered were a proposed dock charge by the Corps of Engineers, and flood control projects for: Carlsbad, N. M.; Aquilla Creek and Texas City, Texas; Little Dell Reservoir, Utah; and the Norwalk River Basin in Connecticut. Also considered were harbor construction and improvement projects for: Fall River, Mass.; Bristol, Rhode Island; and Forestville Harbor and Tawas Bay, Michigan. The Fort Pierce, Florida, Beach Erosion Control Project and the Water Hyacinth Control Program in Florida were discussed. On each project, evidence was taken as to project purposes, effects and benefits of the project, costs, cost-benefit ratio, and local responsibilities for paying the non-federal share of the project. The U. S. Army Corps of Engineers was responsible for all projects. (Caldwell-Florida)

PLAN FOR DEVELOPMENT OF THE LAND AND WATER RESOURCES OF THE SOUTHEAST UNITED STATES RIVER BASINS.
United States Study Commission, Southeast River Basins, Plan for Development of the Land and Water Resources of the Southeast River Basins (1963). 135 p.

Descriptors: *River basin development, *Southeast U. S., *Resource development, *Planning, Project planning, Terrain analysis, River basins, Regions, Benefits, Costs, Cost sharing, Future planning (Projected), Flood control, Recreation, Navigation, Soil conservation, Hydroelectric power, Reservoirs, Water supply, Multiple-purpose projects, Economics, Industrial production, Land use, Water utilization.

The United States Study Commission has developed a comprehensive plan for the development of the resources of the river basins of the Southeastern United States. The report is a detailed explanation of the plan. Part One includes a description of the Southeast River Basins Area, a discussion of its resources, and a presentation of the present and future population and economy. Part Two presents the needs of the Area for each aspect of the plan. Part Three describes planning procedures as applied to the study. Part Four presents the comprehensive plan broken down by individual river basins. Part Five contains the Commission's conclusions and recommendations. The plan was designed to meet the needs of the Area through the year 2000. Aspects of the plan for each basin include flood control, water supply, navigation, hydroelectric power, drainage and irrigation, soil conservation, forest conservation, pollution abatement, recreation, and other beneficial purposes. COMPETITION FOR WATER IN AN EXPANDING ECONOMY: POLICIES AND INSTITUTIONS,
Arizona Univ., Tucson. Dept. of Agricultural Economics.
Maurice M. Kelso.
Nov 1, 1967. 20 p, 2 ref. OWRR Project B-003-ARIZ (5).

Descriptors: *Water rights, *Riparian rights, *Appropriation, Surface waters, Groundwater.

The need for major changes in the institutional and legal allocation of water are discussed. Riparian rights and appropriative rights, as they have evolved through custom and judicial decisions, have become inflexible institutions. The present system of water tenure does not provide for the most socially beneficial development and delivery of growing water needs. It is suggested that the bargaining transaction and the market are the best adapted devices for readjusting water institutions. (Holmes-Rutgers)

Descriptors: *Illinois, *Drainage programs, *C tracts, *Navigable waters, Legislation, Administ tive agencies, Administrative decisions, St governments, Federal government, Permits, De Cost repayment, Drainage, Rivers, Strea Navigable rivers, Judicial decisions, Legal aspect

Plaintiff club petitioned to have a drainage distr dissolved. Defendant dredging company, havin contract with the district, contested the action. T first drainage plan was ordered by the county cou assessments were levied, and the contract with fendant was let, all without approval by the st public works department and the War Departme These plans were modified, and an additional sessment was levied, whereupon district l downers petitioned for dissolution. The petiti was approved under a statute permitting disso tion when no indebtedness existed and the costs dissolution had been advanced. Defendant c tended that the existence of its contract evidenc an outstanding indebtedness prohibiting disso tion. Plaintiff asserted that since the contract v let prior to approval by the public works and W departments, it was illegal and void under statu prohibiting obstruction of navigable waters witho approval. Sustaining plaintiff's assertion by not that navigable waters were involved, the Supre Court of Illinois held the dissolution valid, n withstanding a subcontractor's expenditures reliance on the contract. Descriptors: *Massachusetts, *Easemen *Legislation, *Condemnation, Drainage, Emin domain, Farms, Ditches, State governments, Na ral flow doctrine, Judicial decisions, Legal aspec Surface drainage, Governments, Administrati agencies.

Identifiers: *Constitutionality.

Plaintiff farm owner petitioned for a writ of certiorari to quash eminent domain proceedings brought by defendant commission to establish a drainage easement across plaintiff's land. Water drained from a cemetery adjacent to plaintiff's land, and plaintiff had obtained an injunction restraining the cemetery company from diverting water onto plaintiff's land. The easement sought by defendant restored this drainage across plaintiff's land. Plaintiff asserted: (1) that the cemetery instituted and secured the drainage legislation to avoid the court decree, (2) that the act was a mere contrivance for the cemetery's benefit, and (3) that therefore the act was unconstitutional as a taking for private use. Plaintiff furthermore contended that the legislation was unconstitutional since existing natural drainage would be adequate with improvements. Stating that the statute was presumed valid, and that plaintiff had not shown that the cemetery had obtained it for its own benefit, the Supreme Judicial Court of Massachusetts rejected plaintiff's first assertion. Furthermore, the court held that the validity of the act authorizing the condemnation was unaffected by the existence of a natural drainage system. (Hart-Florida)

Identifiers: *Salt River Project (Arizona), *Waterspace, *Agricultural mechanization.

As American agriculture moved westward from the humid east to the prairies to the semiarid Great Plains, changes in water availability resulted in changes in agricultural operations. The small, family-size subsistence unit developed into the large-scale, mechanized dry farms of the plains. When the plains formula was moved to the arid West, irrigation created a bastardized agriculture in which large-scale crop operations developed through mechanization of planting and growing phases, but which depended upon large, depressed migratory labor populations for harvesting. In arid lands, areas of high water availability impose sharp spatial limitations on agriculture and settlements, and such oases are termed 'waterspace'. This waterspace led to a new agrarian institution--the water users' association. The history is traced of 1 such association in the Salt River Valley, Arizona. Originally this and other associations were committed to the problems of water distribution for agricultural purposes, but recent urban and industrial competition for waterspace have shifted their foci to urban water needs and hydroelectric power. In Arizona this competition, together with declining groundwater levels, seem to indicate a contracting agricultural sector. (Casey-Arizona)

OFFSHORE OIL SPILLS: AN EVALUATION OF RECENT UNITED STATES RESPONSES,
Ved P. Nanda, and Kenneth R. Stiles.
San Diego Law Review, Vol 7, No 3, p 519-540, July 1970. 22 p, 162 ref.

Descriptors: *Legislation, *Water pollution, *Oil, *Oil industry, United States, Exploitation, Oil fields, Oil reservoirs, Natural gas, International waters, Exploration, Geologic formations, Water pollution effects, Water pollution sources, Pollutants, Oil wells, Drill holes, State governments, Federal Government, California, Submerged Lands Act, Legal aspects, Water pollution control, Pollution abatement, Non-structural alternatives.
Identifiers: *Oil spills.

Three recent oil spills--the Torrey Canyon disaster, the Santa Barbara channel faulted strata leakage, and the Gulf of Mexico blowouts--have initiated action by the United States to prevent similar future occurrences. Evaluation of these responses is the objective of this article. Policy considerations conflicting with the prevention of oil spills, such as increasing oil and gas consumption in the United States, are discussed. It is observed that exploitation of offshore petroleum reserves is a relatively recent venture. The development of governmental regulations concerning offshore drilling through the Submerged Lands Act and the Outer Continental Shelf Lands Act is examined. The causes, results, and responses to the Santa Barbara spill are analyzed in detail. The authors emphasize that compliance with the California regulations for offshore wells would have prevented the Santa Barbara spill. The Gulf of Mexico blowouts are examined similarly. The authors conclude that legislation pertaining to oil spills should provide: (1) strict liability for clean-up and damages from spills, (2) broad discretion in the regulating agency to prescribe rules for offshore petroleum exploitation, and (3) for compulsory adjudication to determine fault in pollution incidents. Identifiers: *Constitutionality.

Detailed in this study are the legal, economic, and historical aspects of the battle for federal water-power legislation, culminating in the Federal Water Power Act of 1920. The comparative economic advantages of water power, its historic uses, and its potential for future development are discussed in Chapter I. The legal and constitutional aspects of federal water power are presented in Chapter II. Rights in running water under both riparian rights and prior appropriation doctrines are discussed. Constitutional issues examined by the author include: (1) the extent of state water power, (2) the federal government's right to lease water rights in the public domain, (3) the treaty-making power as a source of federal water power, (4) federal power over navigable streams, and (5) the extent of federal administrative power and discretion. In Chapters III and IV congressional battles over water-power legislation before 1920 are examined. The enactment of the Federal Water-Power Act of 1920, with full text provided in an appendix, is discussed in Chapter V. Progress under the Act, its weaknesses, legal challenges to the Act, and the extent of activity undertaken pursuant to the Act are considered in Chapter VII. (Earl-Florida)

PUBLIC WATER POLICY IN TENNESSEE.
Public Administration Service, Chicago, Ill.

June 1956. 175 p, 19 fig, 22 tab, 72 ref, 1 append.

Descriptors: *Tennessee, *Water policy, *Water law, *Water utilization, Administration, Riparian rights, Reasonable use, Water supply, Surface waters, Groundwater, Public rights, Water resources development, Water pollution, Domestic water, Municipal water, Industrial water, Competing uses, Prior appropriation, Water conservation, Irrigation, Judicial decisions, Legal aspects, Water quality, Administrative agencies, Legislation.

Fulfilling the objectives of a bill passed by the Tennessee legislature, the State Water Policy Commission had this study prepared on Tennessee's water resources and water laws. Chapter I is an introduction and summary and outlines existing water laws in Tennessee, available water supplies, various water uses, and a proposed state water policy. Chapter II discusses Tennessee water law under two headings: (1) the common law riparian doctrine relating to individual rights and obligations with respect to water utilization; and (2) statutory law in such areas as water pollution, public health, flood control and drainage, navigation, water supply, recreation, and interstate relations. Chapters III through V gives factual information on the availability of water resources, various types of withdrawal uses of water, and uses requiring modification and control of stream flow. Some policy recommendations are made in these chapters. Chapter VI is devoted entirely to water policy. It

recommends: (1) statutory modification of the common law, including declaration of public ownership of the water supply, elimination of conflicts in the law, and a move to some type of appropriation system; (2) establishment of a state division of water resources to administer water resources; and (3) creation of agencies for local water users. TOWN OF PERU V STATE (COMPENSATION FOR STATE'S APPROPRIATION OF TOWN'S DOCK).

315 NYS2d 775-777 (Sup Ct App Div 1970).

Descriptors: *New York, *Eminent domain, *Compensation, *Docks, Piers, Lakes, Navigable waters, Navigation, Boats, Cities, Access routes, Condemnation, Land, Legal aspects, Judicial decisions, Roads, Recreation, Local governments.

Plaintiff town sought compensation for appropriation by defendant state of a dock on Lake Champlain and of land providing an access route to the dock. The town had maintained the dock from the time of purchase, constructed a boat launching ramp, and held the dock for the use of town residents. Plaintiff contended it held the dock in a proprietary capacity, while defendant contended that plaintiff held the dock in a governmental capacity, for the furtherance of navigation, and therefore was not entitled to compensation for its appropiation by defendant. The Supreme Court of New York reversed a lower court's action by defendant. The Supreme Court of New York reversed a lower court's dismissal of plaintiff's claim. The town maintained the dock for use of residents only and therefore held the property in a proprietary capacity. The dock was used by pleasure craft and not cargo vessels. Private piers erected on navigable waters cannot be appropriated for a purpose not in the interests of navigation without payment of compensation. (Duss-Florida)

PEOPLE V PORT OF NEW YORK AUTHORITY (REMEDY FOR POLLUTION OF STATE PROPERTY).
315 NYS2d 9-12 (Sup Ct 1970).

Descriptors: *New York, *Water pollution, *Public rights, *Water pollution control, Legislation, Bays, Water pollution sources, Airports, Prescriptive rights, Remedies, Environment, Legal aspects, Judicial decisions, Navigable waters, Public health.

Plaintiff state of New York sought to temporarily enjoin defendant Port of New York Authority from polluting a bay through the discharge of fuel or oil from John F. Kennedy International Airport, which was operated by the defendant. Defendant contended that: (1) it should not be singled out for prosecution as it was one of many contributors to the pollution, (2) the pollution had continued for many years, and (3) issuance of an injunction would require closing of the airport. The Supreme Court of New York County held the motion in abeyance pending a further hearing. The people of statute have an interest in pollution of the state's property. Defendant had no defense because of the duration of the pollution, since there is no prescriptive right to continue wrongdoing. However, since an absolute injunction would close down the airport, the motion would be held in abeyance pending a further hearing on the practicalities of the situation. (Duss-Florida)

LAND DEVELOPMENT, INC V LOUISVILLE GAS AND ELECTRIC CO (LIABILITY FOR FAULTY CONSTRUCTION OF CULVERT DIVERTING STREAM).
459 SWd 150-152 (Ky 1970).

Descriptors: *Kentucky, *Floods, *Alteration of flow, *Culverts, Flood damage, Rain, Rain water, Storm runoff, Streamflow, Reasonable use, Streams, Obstruction to flow, Relative rights, Landfills, Diversion structures, Diversion, Land development, Real property, Land use, Land tenure, Legal aspects, Judicial decisions.
Identifiers: *Injunction (Prohibitory).

Plaintiff city gas and electric utility sought damages from defendant property owners for injuries sustained when defendants' pipeline backed up a stream. In preparing land for construction, defendants has installed a culvert to re-route a stream under their property. Waste matter washed into and stopped up the culvert during unusually heavy rainstorms. Plaintiffs averred defendants creation of this artificial condition had caused the flooding of their property. Defendants contented the rainfalls were an act of God for which they were not liable. The court held that a property owneris liable for flood damages resulting from improper culvert construction where proper construction would have guarded against even unusually heavy rainfalls. The court rejected the defendants act-of-God defense, stating that such an act must be unforeseeable, unpredictable, and of a character which cannot be guarded against. Ruling that the defendants had not made reasonable use of the land, the court affirmed the award of damages to plaintiff. However, a prohibitory injunction against defendant was denied since there had been no showing that flooding would reoccur. (Earl-Florida)

ELKHORN CITY LAND CO V ELKHORN CITY (ABANDONMENT OF WATER WORKS PROPERTY).

459 SW2d 762-765 (Ct App Ky 1970).

Descriptors: *Kentucky, *Land tenure, *Land use, *Water works, Real property, Contracts, Reservoirs, Local governments, Land classification, Landfills, Utilities, Public utilities, Legal aspects, Judicial decisions.

Plaintiff grantor sought reversion of defendant city's interest in property conveyed for water works purposes only. The deed provided for reversion to grantor upon abandonment of the premises for water works use. Plaintiff asserted that defendant's closing of a reservoir and sale of landfill constituted abandonment. Defendant denied abandonment. The Court of Appeals of Kentucky held that the sale of landfill and the closing of a reservoir do not establish abandonment for water works purposes so long as other water work operations continue. Relying on defendant's continued operation of a pumping station, filter plant, and water intake on the property, the court ruled that defendant's actions did not constitute abandonment. The court noted that defendant's sale of landfill did not interfere with the water work's operations in any way. Judgment for defendant was affirmed. (Earl-Florida)

0 So 2d 137-144 (Miss 1970).

escriptors: *Mississippi, *Boundary disputes, and tenure, *Thalweg, Channels, Riparian land, parian rights, Streams, Sand bars, Sands, avels, Damages, Fresh water, Judicial decisions, gal aspects, Ownership of beds, Beds.

aintiff riparian landowner sought to confirm title a sandbar in a stream as against defendant ripari- landowner. Plaintiff's land was located on one e of the stream while defendant's was on the ner. Defendant denied that plaintiff owned the d and filed a cross bill for damages for removal sand and gravel from the sandbar by plaintiff. th parties agreed that the thread of the stream s the dividing line between their properties. wever, plaintiff contended the thread was the lweg of the channel, while defendant contended was the line midway between the opposite relines when the water is at its ordinary stage. e Supreme Court of Mississippi affirmed a lower rt decision for plaintiff. The boundary between perties located along freshwater streams lying olly within the state is the thalweg or deepest tion of the channel of the stream. The boundary hus subject to change due to the gradual vagran- s of the stream. The court denied a petition for earing. One judge dissented on the ground that thalweg rule is not applicable to land bounded freshwater streams within the state. He felt that boundary should have been a line midway ween the shores. (Duss-Florida)

COBS V ELWELL (RIGHT TO PREVENT NSTRUCTION ON BEACH).
A 61-62 (NJ 1930).

scriptors: *New Jersey, *Riparian rights, parian land, *Beaches, Navigable waters, islation, Compensation, Land tenure, High er mark, Low water mark, Cities, Legal aspects, icial decisions, Construction, Local govern- nts, State governments, Public rights.

State of New Jersey, on the relation of plaintiff ch property owner, sought a writ of mandamus pelling defendant city building inspector to e a permit to plaintiff to erect a building on the ch strand. In the original grant of plaintiff's land the state riparian commissioners, the right was rved for the city council to define the bounda- of the beach strand and remove and prevent encroachments on it. This right was given pur- nt to statutory authority. Acting upon this grant city council enacted an ordinance establishing boundaries of the beach and providing for oval and prevention of encroachments. Plain- s proposed building was such an encroachment. Supreme Court of New Jersey found the ute constitutional and the ordinance valid and ied the petition. (Duss-Florida)

YCO REALTY CO V MAYOR, COUN- OR, AND ALDERMAN OF ANNAPOLIS GHT OF CITY TO DISCHARGE SEWAGE O STREAM).
A 273-278 (Md App 1930).

criptors: *Maryland, *Water pollution, wage disposal, *Cities, Navigable waters, age, Sewers, Municipalities, Public health, lic rights, Streams, Riparian land, Riparian ts, Potable water, Sewage bacteria, Beds, ership of beds, Legal aspects, Judicial deci- s, Damages, Remedies, Tidal waters, Shores, age effluents, Discharge (Water).

Plaintiff realty company sought to enjoin defendant city of Annapolis from discharging sewage into a creek along which plaintiff owned land. Plaintiff alleged defendant's acts rendered the creek's water unfit for drinking, bathing, and other recreation. Defendant alleged that it had authority to discharge sewage into the creek for the public's benefit. Defendant also denied that its acts caused the pollution, alleging it was due to natural causes. The Court of Appeals of Maryland affirmed a judgment for defendant. Evidence showed that defendant's acts did pollute the creek. However, the condition existed long before plaintiff bought its land, and was doubtless reflected in the price he paid for it. Discharge of sewage by municipalities into tidal waters by authority of the state is not a nuisance. Under such circumstances incidental damage to private owners gives rise to no remedy. The state is the owner of the beds of navigable waters and may grat to municipalities the right to discharge sewage therein. Such a grant would not absolve a municipality of liability where its actions were negligent or indicative of wanton disregard of public or private rights. However, there was no evidence of wantoness or negligence in the instant case. (Duss-Florida)

STATE V PLANT (VIOLATION OF STATUTE PROHIBITING OPERATION OF BOAT FOR HUNTING DURING CERTAIN HOURS).
155 A 35-36 (Me 1931).

Descriptors: *Maine, *Navigation, *Navigable rivers, *Hunting, Game birds, Water utilization, Rivers, Legislation, State governments, Judicial decisions, Legal aspects, Recreation, Navigable waters, Highways, Regulation.

Plaintiff state brought criminal prosecution against defendant duck hunter for violation of game law. The statute prohibited operation of a boat for hunting earlier than one and one-half hours before sunrise. Defendants launched their boat a few minutes before said period, and proceeded downriver to hunt ducks on a distant island. Defendant contended that the operation of the boat at that time was for navigation rather than hunting, and therefore the statute was not violated. The Supreme Judicial Court of Maine noted that the navigable river was open at all hours for lawful business and pleasure, notwithstanding the state authority to control navigable waters for propogation of fish and protection of migratory birds. The court held that plaintiff was without authority to suspend the general use of a navigable river as a public highway. Since defendant had no intention of hunting ducks until he reached the island, he had not violated the statute. (Hart-Florida)

WEST SHORE RR V STATE (LIABILITY FOR APPROPRIATION OF RIVER FLOW FOR NEW CHANNEL OUTSIDE RIVER).
215 NYS 684-689 (1926).

Descriptors: *New York, *Canal construction, *Condemnation, *Alteration of flow, Railroads, Bridges, Piers, Eminent domain, Channel improvement, Canals, Natural flow doctrine, Riparian rights, Riparian waters, Public rights, Compensation, Damages, Diversion, Water level, Streamflow, Navigable waters, Navigable rivers, Navigation, Legal aspects, Water law, Judicial decisions.

Plaintiff railroad sought to recover damages from defendant state for diverting and lowering the waters of a river, thereby exposing and damaging plaintiff's bridge piers and supports. Plaintiff contended that diversion of river waters into a new canal, which lowered the river and exposed the piers and supports to the elements, constituted a taking and appropriation of plaintiff's property. Defendant argued that plaintiff had already been compensated for its land taken and expenses for bridge alterations and that lowering the river for improvement of navigation resulted in consequential damages for which there is no liability. Reversing a judgment for defendant, the Supreme Court of New York noted that the prior condemnation settlement did not include damage to plaintiff's bridge, but only covered the expense of required alterations. The court held that the digging of a new channel outside of the river was not an improvement of navigation within the river to which riparian rights would be subject without a claim for damages, but was an appropriation of the river's flow for use outside of the river and was compensable.
